SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 12, NUMBER 13
JULY 1, 1979

W79-06001--W79-06500

The Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

NUCLEATION AND GROWTH OF ICE CRYSTALS,
Rocketdyne, Canoga Park, CA.
J. Farrar, and K. Youel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-210 535, Price codes: A04 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 157, February 1966. 61 p, 17 fig, 7 tab, 32 ref. 14-01-0001-333.

Descriptors: *Nucleation, *Freezing, *Ice, *Catalysts, Chemical reactions, Crystal growth, Electrolytes, Drops(Fluids), Particle size, Emulsions, Sea water, Heat, Mass transport, Supercooling, Irradiation, Thermal conductivity, Separation techniques, Desalination.

Experimental techniques were used to observe the beginning of ice growth in water, and to study the catalytic effectiveness of chemical and mechanical nucleation stimuli. Nucleation rates were determined as functions of the sample size and sample source, the concentration of electrolytes and suspended matter, and the intensity of mechanical agitation. Conclusions were drawn in the following areas: behavior of bulk water, effect of particles, nucleation of water drops, and nucleation in water-oil emulsions. Ice nucleated heterogeneously in all experiments. Data from droplet and nucleation studies were compared with nucleation data obtained for octadecane and mercury and the predicted rates for homogeneous nucleation in water, and were found to be in agreement with the liquid-solid interfacial energies of these materials. This substantiates the Turnbull-Fisher theory of nucleation in condensed systems. (Davison-IPA)

2. WATER CYCLE

2A. General

THE EFFECT OF INTERCEPTED RAINFALL ON THE WATER BALANCE OF A HARDWOOD FOREST,
Montreal Univ. (Quebec). Dept. of Geography.
B. Singh, and G. Szeicz.
Water Resources Research, Vol 15, No 1, p 131-138, February 1979. 5 fig, 3 tab, 17 ref.

Descriptors: *Rainfall, *Interception, *Forests, *Water balance, Model studies, Mathematical models, On-site investigations, Evaporation, Evapotranspiration, Trees, Hardwood, Runoff, Soil water, Wetting, Drying, Canopy, Meteorology, Forest water balance, Intercepted rainfall.

Evaporation from a large hardwood forest was estimated from measurements of the required meteorological variables and from measured stomatal resistances. A correction factor was derived to overcome the incorrect assumption that evaporative demand remains the same during wet and dry periods. The factor was based on the ratio of the isothermal resistances during the wet and subsequent dry periods. The stomatal measurements were converted to canopy resistances by dividing by the leaf area index, and the stomatal measurements were used to obtain the water balance for the entire season. The results were analyzed to show that evaporation from a wet canopy is often 2-3 times greater than transpiration from the same surface. Rates of interceptional loss, calculated from the wet and dry evaporation rates, were verified by direct measurements of throughfall and stemflow. Net interceptional loss, equal to the excess evaporation from a wet canopy over a dry one, depended on rainfall duration and character and was on the average about 60-80% of total interception. In the overall summer water balance of 442 mm of precipitation and 52-mm depletion of soil storage, transpiration via the trees accounted for 261 mm, evaporation from the wetted leaves and branches for 111 mm, and runoff for 131 mm, giving an error of closure in the water balance of only 9 mm. If transpiration only had been used instead of interception when the canopy was wet, the error in the water balance would have been 100 mm. (Sims-ISWS)

WATER BALANCE ESTIMATE FOR GEORGIAN BAY IN 1974,
Canada Centre for Inland Waters, Burlington (Ontario).
W. M. Schertzer, E. B. Bennett, and F. Chiocchio.
Water Resources Research, Vol 15, No 1, p 77-84, February 1979. 3 fig, 5 tab, 21 ref.

Descriptors: *Water balance, *Bays, *Great Lakes, On-site investigations, Current meters, Currents(Water), Runoff, Precipitation(Atmospheric), Groundwater, Evaporation, Inflow, Discharge(Water), Water levels, Meteorological data, Hydrology, *Georgian Bay.

Current meter observations and hydrological and meteorological data collected primarily during 1974 formed the basis upon which the monthly water balance of Georgian Bay could be estimated. The data were used to derive a first approximation of the exchange of water between Georgian Bay and main Lake Huron. The net exchange across Main Channel at depths greater than 5 m was determined from extensive current meter observations, while the exchange in the upper 5 m was the residual necessary to achieve a balanced water budget. The results illustrate that during the stratified season (May through November), the transport of water through Main Channel is also stratified, with surface water moving into Georgian Bay from main Lake Huron; while continuity is maintained by net outflow at depths greater than 5 m. Total annual supply from runoff and direct precipitation is nearly twice as large as combined losses from evaporation and flow to North Channel. Residence and flushing times for water in the bay were estimated at 5.1 and 5.7 years, respectively. (Sims-ISWS)

GEOLOGIC APPLICATIONS OF LANDSAT IMAGES IN NORTHEASTERN ARIZONA TO THE LOCATION OF WATER SUPPLIES FOR MUNICIPAL AND INDUSTRIAL USES,
Arizona State Univ., Tempe. Dept. of Geology.
E. Babcock, P. Briggs, K. DeCook, L. Ethridge, and K. Foster.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 816, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Research Center, University of Arizona, Tucson, Project Completion Report, April 1979. 92 p, 32 fig, 8 tab, 97 ref. OWRT B-066-ARIZ(1). 14-34-0001-8060.

Descriptors: *Groundwater, *Remote sensing, Landsat, Lineaments, Arizona, Aerial photography.

There is an increasing need for dependable municipal and agricultural water supplies, in addition to supplies needed by the rapidly expanding, coal-fired power plants, in the Four Corners Region of the Southwest. It has been previously shown that well production in northern Arizona sandstone aquifers is enhanced by deep fracturing. If such fractures extend to the surface, corresponding fault patterns may provide a basis for exploration for additional water supplies. In this study, photolineaments of the entire northeast quadrant of Arizona were mapped from standard EROS Data Center false color Landsat composites. In addition, photolineaments were mapped using computer-enhanced Landsat imagery of two intensive study sites. A third source of geologic structure data were existing large scale lineament maps derived from aerial photography of the study sites. Several spatially-distributed parameters obtained from these maps, such as lineament density and well-to-lineament distance are mathematically correlated with water well survey data (specific capacity, specific conductance, transmissivity, and water temperature) within the study sites to establish the most useful combination of data for extension of 'lineament signatures' throughout the entire northeast quadrant. Results indicate that Landsat imagery may be used to survey large areas for lineaments, and to cue the hydrogeologist to promising regions, which can then be mapped at aerial photography scales.

HYDROLOGIC MONITORING IN THE AREA OF THE TENNESSEE-TOMBIGBEE WATERWAY, MISSISSIPPI-ALABAMA, FISCAL YEAR 1978,
Geological Survey, Jackson, MS. Water Resources Div.
J. D. Shell.
Geological Survey open-file report, March 1979. 154 p, 1 fig, 2 tab, 5 append.

Descriptors: *Hydrologic data, *Inland waterways, *Surface waters, *Groundwater, *Water quality, Aquifers, Well data, Water yield, Water levels, Hydrographs, Water level fluctuations, Streamflow, Flow rates, Sediment transport, Water analysis, Physical properties, Chemical properties, Mississippi, Alabama, *Tennessee-Tombigbee Waterway.

This report, the fifth in a series of data reports prepared at the request of the Corps of Engineers, presents data collected in a study of the hydrologic effects of the Tennessee-Tombigbee Waterway. Included in this report are hydrographs of 149 observation wells, analyses of water samples from 12 wells and 23 surface-water stations, daily discharge for three surface-water gaging stations, and daily summaries of water-quality monitor records at 3 surface-water sites. (Woodard-USGS)

HYDROLOGIC DATA, 1974-77, STOVEPIPE WELLS HOTEL AREA, DEATH VALLEY NATIONAL MONUMENT, INYO COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
C. E. Lamb, and D. J. Downing.
Available from OFSS, USGS Box 25425, Fed. Ctr. Denver, CO. 80225, printed copy $3.25, microfiche $3.50. Geological Survey open-file report 79-203, January 1979. 19 p, 4 fig, 4 tab, 2 ref.

Group 2A—General

Descriptors: *Groundwater resources, *Observations wells, *Water levels, *Water quality, *Streamflow, Hydrologic data, Well data, Base flow, National parks, California, *Death Valley National Monument, *Stovepipe Wells Hotel area, Salt Creek.

Ground-water levels in most wells did not change significantly from 1974 to 1977 in the Stovepipe Wells Hotel area, California. The average water-level decline was less than 0.10 foot between August 1974 and August 1977 in 10 observation wells. Water-level contours show a depression centered on the two pumping wells, but this depression existed before the National Park Service started pumping its well. The chemical quality of the ground water is poor. Dissolved-solids concentrations in water samples ranged from 2,730 to 6,490 milligrams per liter. Analyses of water samples from two wells showed large changes in some constituents from 1976 to 1977. Streamflow in Salt Creek has been monitored since February 1974. Base flow is seasonal, being 0.10 to 0.20 cubic foot per second during the summer and as much as three times that amount during the winter. Two chemical analyses of water from Salt Creek, representing summer and winter flow conditions, show large differences for many constituents. (Woodard-USGS)
W79-06313

SIMPLE NON-LINEAR MODELS FOR THE COOLING OF WELL-MIXED RIVERS,
Vienna Univ. (Austria). Inst. of Meteorology and Geophysics.
P. Kahlig.
Water, Air, and Soil Pollution, Vol 10, No 1, p 61-70, July 1978. 5 fig, 3 tab, 8 ref.

Descriptors: *Water temperature, *Cooling, *Rivers, *Model studies, Mathematical models, Heat transfer, Mixing, Winds, Temperature, Thermal capacity, Depth, Evaporation, Thermal radiation, Equations, Well-mixed rivers.

Using the presently known data of the temperature dependence of the coefficient of heat exchange at an air-water interface, the non-linear equation governing the one-dimensional cooling of a well-mixed river was solved analytically. It turns out that the effects of non-linearity are negligible within the small parameter range occurring in hydrological applications, justifying the use of linear models in one-dimensional river temperature calculations (e.g., exponential method). It was shown that the frequently used assumption of an exponential decay of excess temperature represents an acceptable approximation. (Sims-ISWS)
W79-06396

THE WATERSHED INFLUENCE ON STORM RUNOFF IN SMALL NORWEGIAN RIVERS,
Norges Vassdrags- og Elektrisitetsvesen, Oslo.
E. Ruud, T. Tjomsland, and K. Nordseth.
Nordic Hydrology, Vol 9, No 5, p 277-292, 1978. 5 fig, 2 tab, 21 ref.

Descriptors: *Watersheds(Basins), *Storm runoff, *Correlation analysis, *Model studies, Mathematical models, Effects, Rivers, River flow, Storms, Floods, Runoff, Hydrographs, Rainfall, Regression analysis, Hydrology, *Norway.

A procedure to isolate and investigate the watershed influence on storm runoff was presented. It offers an opportunity to study also the change in influence of particular watershed characteristics by changing the input or soil moisture state of each catchment. Weighted lake area, area of bare rocks, main stream gradient, drainage density, and basin area were found to be the most significant characteristics in affecting peak runoff and time of rise on storm hydrographs in small Norwegian rivers. The intercorrelation structure of the watershed properties was examined. (Sims-ISWS)
W79-06406

THE DYNAMICS OF A DRAINAGE NETWORK,
Southampton Univ. (England). Dept. of Geography.
A. M. Gurnell.
Nordic Hydrology, Vol 9, No 5, p 293-306, 1978. 11 fig, 1 tab, 17 ref.

Descriptors: *Dynamics, *Drainage, *Watersheds(Basins), *Networks, Drainage density, Soil moisture, Precipitation(Atmospheric), Discharge(Water), Vegetation, Vegetation effects, Rocks, Runoff, Antecedent precipitation, Rainfall, Hydrographs, Storms, Storm runoff, Regression analysis, Hydrology.

The dynamics of the drainage network within a small catchment were studied in detail. Variations in the network were related both to transient characteristics of the catchment, including precipitation, soil moisture content, and discharge, and to more permanent characteristics including vegetation and rock type. A STATISTICIAN'S VIEW OF WEATHER MODIFICATION TECHNOLOGY (A REVIEW),
California Univ., Berkeley. Statistical Lab.
J. Newman.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A051 439, Price codes: A02 in paper copy, A01 in microfiche.
Proceedings of the National Academy of Sciences, Vol 74, No 11, p 4714-4721, November 1977. 1 fig, 1 tab, 42 ref.

Descriptors: *Reviews, *Weather modification, *Statistical methods, *Technology, *Cloud seeding, *Methodology, *Analytical techniques, Precipitation(Atmospheric), Droughts, Testing procedures, Policy, Silver iodide, Randomization, Evaluation, Hail, Statistics.

Available evidence on effectiveness of weather modification techniques shows: (1) Present cloud seeding technology has not been reliably confirmed as a means of alleviating draught. (2) Although cloud seeding does affect precipitation and up to hundreds of kilometers beyond intended targets, effects vary from large increases to large decreases in precipitation. (3) Hypothetical mechanisms advanced to explain such effects differ in empirical support and plausibility, and much of existing literature (including from official sources) is slanted and unreliable. (4) At least two philosophically different interdisciplinary research groups, including statisticians, should be established to reevaluate data from experiments already performed, and to continue with properly planned experimentation. Suitable methodology is outlined, and established of a randomization center is recommended. This paper presents examples of contradictory conclusions from the same data, and conclusions derived from faulty methodology; for example, the historical regression technique has been shown to be unreliable, yet it continues to be used in analyzing field tests. Experiments and projects discussed include the Whitetop experiment, Swiss hail prevention experiment, cloud seeding in Arizona's Santa Catalina Mountains, Bureau of Reclamation's Skywater Conferences, Pyramid Lake experiment, Colorado River Basin Pilot Project, National Hail Research Experiment, and Florida Area Cumulus Experiment. (Lynch-Wisconsin)

CLOUD PHYSICS AND WEATHER MODIFICATION.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 740, Price codes: A07 in paper copy, A01 in microfiche.
Translation of FIZIKA OBLAKOV I AKTIVNYKH VOZDEISTVII, 1967. Translated from Russian. Amerind Publishing Co., New Delhi, India. 1977. Levin, L.M. and Litvinov, I.V. (eds). 121 p, 23 fig, 9 tab, 98 ref.

Descriptors: *Weather modification, *Cloud physics, *Clouds, *Precipitation(Atmospheric), *Meteorology, *Raindrops, *Translation, *Foreign research, Condensation, Radar, Measurement, Cloud formation, Chemistry of precipitation, Cloud seeding, Model studies, Equations, Mathematical studies, Reflectivity, Supersaturation, Turbulence, Atmospheric pressure, Atmospheric physics, Atmosphere.

This collection of 10 articles deals with the influence of cloud drop formation on condensation nuclei, factors affecting drop growth, temporal stability of cloud radar reflectivity values, cloud redistribution over a limited area, relative norms of reagent discharge in weather modification, and a method for improving radar cloud measurement accuracy. Individual articles concern: (1) Gravitational coagulation of charged cloud drops in a turbulent medium, using a two-layer turbulence model. (2) Aspects of the theory of atmospheric condensation nuclei accompanied by a theoretical model, with proposal of a fluctuation mechanism of cloud drop formation. (3) Fluctuation of vapor concentration and magnitude of supersaturation in the atmosphere, including discussion of the influence of pressure fluctuation and the problem of smoothing the spectral function of supersaturation. (4) Condensation growth of drop on a hygroscopic nucleus, considered in the quasi-static approximation. (5) Calculation condensation growth time of a drop on a hygroscopic particle, taking into account influence of heat of condensation. (6) Redistribution of precipitation due to nucleation. (7) Temporal stability in radar reflectivity value, showing that its interrelationship with liquid precipitation intensity often changes during a storm. (8) Pressure of water vapor over solution. (9) Relative scale of dispensers in weather modification by crystallizable reagents in supercooled clouds. (10) Surface-active substances action on water drop evaporation. (Lynch-Wisconsin)

MAXIMUM LIKELIHOOD ESTIMATION OF FOURIER COEFFICIENTS TO DESCRIBE SEASONAL VARIATIONS OF PARAMETERS IN STOCHASTIC DAILY PRECIPITATION MODELS,
Science and Education Administration, Fort Collins, CO.
D. A. Woolhiser, and G. G. S. Pegram.
Journal of Applied Meteorology, Vol 18, No 1, p 34-42, January 1979. 2 fig, 3 tab, 13 ref, 2 append.
NSF GK-31521X.

Descriptors: *Precipitation(Atmospheric), *Rainfall, *Model studies, Mathematical models, Fourier analysis, Stochastic processes, Markov processes, Regression analysis, Equations, Optimization, Mathematics, Weather, Meteorology, Climatology.

Methods were investigated to obtain maximum likelihood estimates of the Fourier coefficients to describe the seasonal variability in the parameters for a stochastic rainfall model. Parameters were obtained from a two-state Markov chain model for wet and dry day occurrence, and from a mixed exponential model for distribution of depth on wet days. The procedure was demonstrated on 4 sample stations scattered across the continental United States. A constrained multivariate optimiz-

ation scheme and a simple univariate procedure were used for maximum likelihood estimation, and these were compared with a least-squares estimate. The two seasonally varying parameters for the Markov chain were mutually independent, but the Fourier coefficients for each parameter were weakly dependent. The 3 seasonally varying parameters in the mixed exponential distribution were mutually dependent. However, for the 4 precipitation records analyzed, it appears that acceptable results can be obtained by simultaneously estimating the constant series terms and then independently estimating the harmonic amplitudes and phase angles. A likelihood ratio test can be used to test the significance of each added harmonic. It also appears from this analysis that the significant Fourier coefficients can be plotted on maps as isopleths, providing a concise description of regional precipitation climatology. (Sims-ISWS)

URBANIZATION AND CHANGES IN PRECIPITATION, A STATISTICAL APPROACH,
Royal Netherlands Meteorological Inst., De Bilt.
T. A. Buishand.
Journal of Hydrology, Vol. 40, No. 3/4, p 365-375, February 1979. 3 fig, 6 tab, 5 ref.

Descriptors: *Precipitation(Atmospheric), *Rainfall, *Urbanization, Cities, Rural areas, Seasonal, Variability, Effects, Analytical techniques, Data processing, Statistics, Weather, Meteorology, *The Netherlands.

Monthly rainfall data from urbanized and rural areas in the western part of The Netherlands were used to investigate the urban effects upon the rainfall regime. A trend test in the sequence of differences between urban and rural rainfall amounts was described. For the urban areas of Amsterdam and Rotterdam, some evidence was found for an increase in precipitation. (Sims-ISWS)

CLIMATE,
California State Univ., Long Beach.
J. C. Kimura.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol 1, p 2-1 - 2-70, September 1974. 37 fig, 15 tab, 26 ref.

Descriptors: *Baseline studies, *Climate, *Cloud cover, *Hazards, Resources development, Environmental effects, Water resources, Precipitation, Coasts, *Outer Continental Shelf.

The immediate coastal zone of Southern California seaward to the western boundary of this study area (121 Meridian) is classified as belonging to the Mediterranean Dry Summer Subtropical climatic type, with a cool summer regime. Along the maritime fringe, temperatures are controlled by the sea. The warm month average is comfortably below 72F, while the cold month average is above 50F. Because of the moist air, the relative humidity at night is high, generally above 90%. As the temperature rises during the day, relative humidity decreases to about 60%. Precipitation is strongly concentrated in winter, with average annual values in the vicinity of 15 inches, decreasing over the sea and the immediate rain-shadows of the islands, and increasing over the coastal mountain slopes. Fewer than half of the days of the year are classed as cloudy (7/10 or more of the sky covered by clouds), and heavy fog averages 53 days per year at Los Angeles International Airport, decreasing to some 30 days at San Diego. The principal could type that contributes to low ceiling and restricted visibility in the Southern California Coastal and Offshore Region is stratus. The sea-surface temperature plays an essential role in the formation of stratus and fog over and near the ocean. In addition to its seasonality, there is a marked diurnal variation in the occurrence of stratus. As this cloud is advected inland a few miles by the sea breeze during the day, heat which the land absorbs evaporates the stratus, while the surrounding sea may be fogged in. DELINEATION AND ENGINEERING CHARACTERISTICS OF PERMAFROST BENEATH THE BEAUFORT SEA,
Army Terrestrial Sciences Center, Hanover, NH.
P. V. Sellmann, E. Chamberlain, S. Arcone, S. Blouin, and A. Delaney.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XI, Hazards, p 50-74, October 1978. 7 fig, 2 tab. NOAA, Outer Continental Shelf Environmental Assessment Program. Boulder, Colorado. 01-5-022-2313.

Descriptors: *Permafrost, *Sediments, *Baseline studies, Environmental effects, Resources development, Oil spills, Water pollution, Alaska, *Outer Continental Shelf, *Engineering properties, Beaufort Sea, Petroleum development.

The objective of CRREL's subsea permafrost program is to obtain specific information on the distribution and engineering characteristics of permafrost beneath the Beaufort Sea. Observations include determinations of subsea sediment temperature, type, ice content, and chemical composition. The following conclusions were made: Ice-bonded sediments were encountered locally in the upper 10 m of sediment, in water depths of 2 m off the Sagavanirktok delta. The position of the bonded permafrost interface is extremely variable, as would be anticipated in a marginal permafrost zone. The distribution of bonded sediments is strongly related to engineering properties, primarily grain size and degree of initial ice saturation, as well as other factors such as water depth and transgressive and preinundation history of the area. It is not inconceivable that ice-bonded sediments can occur locally nearer the surface of the sea bed with increasing distance from shore. Fine-grained sand, silt and clay sediments occur near the sea bed to beyond Reindeer Island, and are as great as 10 m in thickness. Shallow, highly overconsolidated marine clays occur seaward and slightly shoreward of Reindeer Island in areas that have been studied. If the freeze-thaw mechanism is responsible for their formation, they could be found in many shallow water areas where fine-grained marine sediments occur. (Sinha-OEIS)

OFFSHORE PERMAFROST STUDIES, BEAUFORT SEA,
Geological Survey, Menlo Park, CA.
D. M. Hopkins, and R. W. Hartz.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XI, Hazards, p 75-147, October 1978. 1 fig, 10 append. NOAA, Outer Continental Shelf Environmental Assessment Program. Boulder, Colorado.

Descriptors: *Permafrost, *Hazards, *Drilling, *Baseline studies, Stratigraphy, Sea ice, Boreholes, Resources development, Environmental effects, Alaska, *Outer Continental Shelf, Beaufort Sea, Pollen chronology, Geothermal profiles, Radiocarbon dates, Petroleum development.

The main objective in this study is to obtain direct knowledge of offshore permafrost by drilling and thermally instrumenting boreholes in the Prudhoe Bay area. Utilizing sea ice as a drilling platform, four boreholes were drilled and cored during the spring of 1977. During 1977 drilling operations intact ice-bonded cores were recovered for the first time and it was established that ice-bonded permafrost is likely to be present within a few meters below the sea bottom at points as much as 17 km offshore. The 1977 boreholes also provide evidence of rapid thermokarst subsidence following initial submergence and they establish that Prudhoe Bay is the remnant of an ancient thaw lake that once extended to Gull Island Shoal. The report presented detailed data on stratigraphy, fossil content, radiocarbon dates, pollen chronology, and geothermal profiles. (Sinha-OEIS)

SUBSEA PERMAFROST: PROBING, THERMAL REGIME AND DATA ANALYSIS,
Alaska Univ., Fairbanks. Geophysical Inst.
T. E. Osterkamp, and W. D. Harrison.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol. XI, Hazards, p 570-650, October 1978. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-55.

Descriptors: *Hazards, *Permafrost, *Drilling, Baseline studies, Resources development, Environmental effects, Oil pollution, *Outer Continental Shelf, *Thermal regime, Petroleum development, Beaufort Sea, Chukchi Sea.

The objectives are to determine the distribution and properties of subsea permafrost in Alaskan waters. Besides direct measurements, the program includes an effort to understand the basic physical processes responsible for the subsea regime, as a basis for predictive models. Work has been carried out in both the Chukchi and Beaufort Seas, and the conclusions are stated separately for each. To develop proper precaution against potential problems a better understanding is needed for the horizontal and vertical distribution of subsea permafrost and permafrost and the processes that control this distribution. It should be emphasized that drilling data exist only near Barrow and Prudhoe Bay in the Beaufort Sea and that extrapolations to other areas must be highly speculative. For the present the concerns are for the safety of exploratory drilling, but the eventual objective is not only to find, but to produce hydrocarbons. At this stage, permafrost and hydrate conditions will be even more important since hot fluids in the well-bore are unavoidable. Thus, it is very important to maximize the derived downhole information at the initial stage of exploratory drilling. (Sinha-OEIS)

Descriptors: *Permafrost, *Hazards, *Seismic studies, *Baseline studies, Resources development, Distribution, Environmental effects, Oil pollution, Alaska, *Outer Continental Shelf, Petroleum development, Beaufort Sea, Thermal models.

The known oil reserves along the Beaufort Sea coast coupled with a national need to develop these resources have focused attention on the distribution and character of permafrost in that area.

This study of coastal offshore permafrost utilizes seismic refraction techniques to probe the ocean bottom. The most important parameter to be determined is the distribution of offshore permafrost. Also, the depth to the top of the bonded permafrost beneath the ocean floor is to be determined. The distribution study has focused primarily on the Prudhoe Bay area with secondary emphasis at Point Barrow. The truncation of permafrost beneath the ocean is of interest, particularly the shape of the frozen-nonfrozen boundary. One import facet of the second objective is determining the nature and extent of the permafrost beneath the barrier islands. These results will provide valuable information for refinement and testing of thermal models as well as for determining operational methods for offshore oil and gas development. The third major objective is to provide information to support reconnaissance drilling programs. (Sinha-OEIS)

Two temperature profiles recorded by a sensitive bathythermograph at the Ross Ice Shelf Project site (82 deg 22.5 min S, 168 deg 37.5 min W) were presented. From the shape of the profiles it was concluded that an inflow of water at intermediate depths provides a source of heat to drive a regime in which ice is melted from the interface at a depth of 360 meters. Melting maintains the temperature of a thick layer under the ice at about -2.14C, close to the ambient freezing temperature. A very well mixed layer about 35 meters thick was found at the seabed. A COMPARISON OF TWO FORMULA TYPES FOR CALCULATING LONG-WAVE RADIATION FROM THE ATMOSPHERE,
Agricultural Research Service, Sidney, MT. Northern Plains Soil and Water Research Center.
J. K. Aase, and S. B. Idso.
Water Resources Research, Vol. 14, No. 4, p 623-625, August, 1978. 1 fig, 1 tab, 14 ref.

Descriptors: Radiation, Thermal radiation, Solar radiation, Air temperature, Humidity, Vapor pressure, Estimating equations.

Measurements of long-wave radiation at Sidney, Montana, indicated that both an analytically derived equation and an empirically derived equation for clear-sky conditions adequately predict the long-wave radiation flux at that site for screen level air temperatures above 0C. However, for air temperatures below 0C the analytical equation always underestimated the true radiation, while the empirical equation just slightly underestimated it, then matched it, and then overestimated it, as air temperature decreased from 0C to -37C. These discrepancies in the below 0C temperature regime indicated that the equations might need some modification to conform more closely to reality for low-temperature conditions. EVAPOTRANSPIRATION FROM DOUGLAS FIR STANDS EXPOSED TO SOIL WATER DEFICITS,
British Columbia Univ., Vancouver. Dept. of Soil Science.
T. A. Black.
Water Resources Research, Vol. 15, No. 1, p 164-170, February 1979. 11 fig, 3 tab, 23 ref.

Descriptors: *Evapotranspiration, *Douglas fir trees, *Soil water, Root zone, Trees, Water balance, Energy budget, On-site investigations, Radiation, Solar radiation, Evaporation, Drying, Water storage, Vegetation, Vegetation effects, Forests, Moisture deficit, Analytical techniques.

The rate of evapotranspiration from thinned and unthinned stands of Douglas fir was measured using energy and water balance methods. At high values of soil water storage in the root zone, the evapotranspiration rate was approximately 80% of the equilibrium evaporation rate. Below a critical value of soil water storage, the ratio of the evapotranspiration rate to the equilibrium evaporation rate (E/E sub eq) tended to decrease linearly with decreasing soil water storage. The critical values of soil water storage in the root zone were 11.8 and 8.3 cm for the thinned and unthinned stand, respectively. Below these critical storage values, there was approximately 3.5 cm of water remaining in both root zones that was extractable by the trees. The relationship between E/E sub eq and the fraction of extractable water in the root zone for both stands was very similar for sunny days. In this relationship, E/E sub eq began to decrease when there was approximately 40% of the extractable water remaining in the root zones of both stands. (Sims-ISWS)

ENERGY BUDGET EVALUATION OF THE TRANSPIRATION-PF RELATIONSHIP IN A YOUNG PINE FOREST,
West Virginia Univ., Morgantown. Div. of Forestry.
S. Tajchman, F. Hadrich, and R. Lee.
Water Resources Research, Vol. 15, No. 1, p 159-163, February 1979. 3 fig, 3 tab, 15 ref.

Descriptors: *Evapotranspiration, *Forests, *Pine trees, *Energy budget, Radiation, Heat, Water loss, Temperature, Winds, Humidity, Clouds, Rainfall, Weather data, Data processing, Analytical techniques.

By using the Bowen ratio method, hourly and daily evapotranspiration totals were determined during a drying period for a 9-year-old pine forest situated in the upper Rhine area of Germany. A relationship between the soil water suction, expressed by pF, and the ratio Q of the latent heat of evapotranspiration to the available energy was obtained. For pF between 2 and 3, Q = 0.6, and for pF more than 3, Q decreases exponentially when pF increases. For pF = 4.2, Q = 0.11. These and other empirical and theoretical results suggested that the Q-pF relationship can be useful for calculating evapotranspiration from complex terrain situations where the micrometeorological approach is inapplicable. CLIMATOLOGICAL ESTIMATES OF LAKE EVAPORATION,
Department of the Environment, Ottawa (Ontario). Hydrology Research Div.
F. I. Morton.
Water Resources Research, Vol. 15, No. 1, p 64-76, February 1979. 6 fig, 5 tab, 15 ref.

Descriptors: *Arizona, *Oklahoma, *California, *Nevada, *Canada, *Lake Ontario, Evaporation, *Energy budget, Climatology, Transpiration, Temperature, Humidity, Radiation, Environment, *Lake evaporation, *Areal evaporation, *Nile River, *Lake Hefner(CA), *Salton Sea, *Dauphin Lake(MB), *Lake Mead, Areal transpiration, Annual lake evaporation, Sunshine, Land environment.

A model for estimating areal evaporation and transpiration was modified slightly to provide estimates of annual lake evaporation from monthly observations of temperature, humidity, and sunshine duration (or radiation) in the land environment. The model estimates were higher than the more conventional estimates in humid areas and lower in arid areas, with the latter tendency particularly noticeable in the case of Lake Nasser on the Nile River. However, the results agreed very well with comparable water budget estimates for

Lake Hefner in Oklahoma, the Salton Sea and Silver Lake in California, Pyramid Lake in Nevada, Lake Ontario, and Dauphin Lake in Manitoba. The model results also compared reasonably well with energy budget estimates of the evaporation from Lake Mead on the border between Arizona and Nevada when the net inflow of heat was taken into account. A technique that provided such realistic results over a wide range of depths and environments with readily available data proved useful in water resource or environmental impact studies. Examples of such uses were provided by maps of Canada and the southeastern United States and showed average annual values of the lake evaporation, average values of the difference between the evaporation from a projected reservoir, and the combined evaporation and transpiration from the area before flooding. (Roberts-ISWS)

ROLE OF EVAPORATION IN SPRINGTIME RUNOFF LOSSES IN THE DRAINAGE BASINS OF THE FOREST ZONE OF THE EUROPEAN USSR,
O. I. Krestovskiy, and A. G. Sergeyeva.
Soviet Hydrology: Selected Papers, Vol. 16, No. 2, p 93-97, 1977. 2 fig, 2 tab, 11 ref. Translated from Trudy Gosudarstvennogo Gidrologicheskogo Instituta, No. 233, p 79-86, 1977.

Descriptors: *Evaporation, *Snowmelt, *Runoff, Floods, Melt water, Snow, Surface waters, Soil water, Drainage, Watersheds(Basins), Flood forecasting, On-site investigations, On-site data collections, Evaporation pans, Melting, Water loss, *USSR.

Evaporation during the spring flood takes place from the surface of the snow, from water at the surface of a basin, and from snow-free soil. Total evaporation from the date of establishment of the maximum water equivalent of snow to the date of snow disappearance, i.e., during the period of runoff formation at the surface of drainage basins, averages 30-50 mm in the lowland area of the forest zone of the European USSR and varies by years and basins from 15 to 60 mm. Evaporation accounts for 30-60% of the total spring water losses, or 15-25% of the total water equivalent by the beginning of snow melting and precipitation during the runoff-forming period in spring. Daily total evaporation from more than 30% wooded basins averages about 1.0 mm/day and varies little from year to year. Therefore, total evaporation is determined in many respects by the duration of the runoff-forming period, i.e., the period of snow melting in forests, which depends to a large extent on the water equivalent. The presence of an indirect relation between total evaporation and the water equivalent of snow makes it possible to precalculate water losses through evaporation. In existing methods for the long-range forecasting of the spring runoff volume, the losses of water through evaporation are taken into account automatically, since the water equivalent of snow is the main argument in all prognostic relations. A PARAMETERIZATION OF THE EVAPORATION FROM NONSATURATED SURFACES,
Commonwealth Scientific and Industrial Research Organization, Mordialloc (Australia). Div. of Atmospheric Physics.
I. J. Barton.
Journal of Applied Meteorology, Vol 18, p 43-47, January 1979. 2 fig, 15 ref.

Descriptors: *Parametric hydrology, *Evaporation, *Surfaces, Radiation, Moisture content, Temperature, Air temperature, Variability, Moisture, Soil moisture, *Unsaturated surfaces, Net radiation, Constants, Variables, Moisture availability, Open grassland surfaces, Near-surface soil moisture.

The parameterization of evaporation proposed by Priestley and Taylor was modified to take account of nonsaturated surfaces. It was suggested that evaporation could be expressed as a function of net radiation, air temperature, a constant related to the nature of the surface, and a variable that was dependent on moisture availability. The constant was equal to 1.26 for water and open grassland surfaces, but was nearer unity for some other surfaces. The variable was found to be directly related to near-surface soil moisture content for both bare and grassland surfaces. (Roberts-ISWS)

2E. Streamflow and Runoff

FORECASTING SEASONAL SNOWMELT RUNOFF: A SUMMARY OF EXPERIENCE WITH TWO MODELS APPLIED TO THREE DRAINAGES IN THE CASCADE MOUNTAINS OF WASHINGTON,
Washington Univ., Seattle. Dept. of Civil Engineering.
D. P. Lettenmaier, and T. J. Waddle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 656, Price codes: A06 in paper copy, A01 in microfiche. Charles W. Harris Hydraulics Laboratory Technical Report No. 59, November 1978. 104 p, 27 fig, 8 tab, 29 ref. OWRT B-071-WASH(2). 14-34-0001-7199.

Descriptors: *Runoff forecasting, *Snowmelt, Stochastic hydrology, Optimization, Reservoir operation, Watersheds.

Two alternative approaches to forecasting seasonal runoff volumes from watersheds with substantial snow storage were investigated. In the first, a continuous simulation model developed by the National Weather Service River Forecast Center in Sacramento, California was applied to the Cedar River, Washington. Although the model had proved quite successful in forecasting runoff from several California Sierra Nevada streams, the model could not be successfully calibrated for use in forecasting Cedar River runoff. Problems were traced to the snowpack accumulation and ablation module of the model; adequate performance of the land module was observed as evidenced by successful simulation of runoff events during seasons of the year with minimum snow water storage. The principal difficulties with the snowpack module appeared to be (1) use of the saturated adiabatic lapse rate for temperature computation regardless of weather conditions, (2) an unrealistically low partition temperature for discrimination between precipitation falling as rain and snow, (3) the method of computation of cloud cover for modification of solar radiation reaching the snowpack, (4) unrealistically low wind movement required to calibrate the condensation melt portion of the snowpack module, and (5) possible underestimation of the free water retention in the snowpack. The second approach employed was a modification of Tangborn's (1977) basin storage accounting approach, in which parameters are estimated by regression. The model was applied to three Washington streams: the Cedar, American and Stehekin Rivers. Inclusion of the snow course data substantially improved the accuracy of the Cedar River forecasts, substantially decreased the accuracy of the Stehekin River forecasts, and made little difference to the American River forecasts. Forecasts had little value beyond about March 15 for all the basins and had negative value to the Stehekin River forecasts. Increased precipitation forecast worth was observed for early winter runoff forecasts.

INCORPORATION OF FORECASTED SEASONAL RUNOFF VOLUMES INTO RESERVOIR MANAGEMENT,
Washington Univ., Seattle. Dept. of Civil Engineering.
S. J. Burges, and K. Hoshi.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 655, Price codes: A05 in paper copy, A01 in microfiche. Charles W. Harris Hydraulics Laboratory Technical Report No. 58, November 1978. 92 p, 7 fig, 8 tab, 65 ref. OWRT B-071-WASH(1). 14-34-0001-7199.

Descriptors: *Snowmelt, Stochastic hydrology, Optimization, Reservoir operation, *Runoff forecasting, Regression analysis.

The forecasting approaches can be classified as regression methods, pseudo water balance methods, and water balance methods. The major effort of this report focused on disaggregating predicted total seasonal runoff volumes to yield conditional probability distributions of flow in each month of the total forecast period. These conditional distributions were used as principal input data to a reservoir operation model. Forecasts of total snowmelt seasonal runoff volumes were used to determine operating rules for hypothetical reservoirs to determine the relative advantage of using forecasted flow over the unconditional flow state. Comparisons were made using chance constrained linear programming (CCLP) formulations for the operation of a single multiple purpose reservoir with and without snowmelt runoff forecasts. Two reservoir sizes, one approximately 20% and the other 100% of the mean annual flow volume of a river, were examined. Flow data from the Cedar River, Washington, were used to reflect runoff patterns typical of much of the Pacific Northwest region. Conditional streamflow distributions for months March-August were developed for given total March-August runoff volume amounts. These conditional distributions were used to develop Linear Decision Rules (LDR's) for the release from the reservoir. Economic benefits were computed for maximum ignorance operating rules (Type A), Type A operating rules with conditional inflows (Type B) and LDR's and benefits based on the conditional flows (Type C). Generally, under Type C operation there was less uncertainty in the cumulative distributions of water supply and reservoir freeboard (surrogate for flood control) than when Type A operation was used.

AN OBJECTIVE CRITERION FOR THE SELECTION OF REPRESENTATIVE BASINS,
Ibadan Univ. (Nigeria). Dept. of Geography.

F. S. Ebisemiju.
Water Resources Research, Vol. 15, No. 1, p 148-158, February 1979. 6 fig, 5 tab, 28 ref.

Descriptors: *Watersheds(Basins), *Africa, *Basins, *Drainage patterns(Geologic), *Geomorphology, Rivers, River basins, Drainage, Geology, Channel morphology, Channels, Classification, Hydrology, *Nigeria.

The existence of a hydrologically uniform area is questionable. Therefore, it is unlikely that a drainage basin can truly represent the diverse environmental and terrain conditions in any given area. The widely documented strong association between basin morphometry and hydrological responses indicates the possibility of identifying hydrologically similar basins on the basis of similarity of their gross morphology. By using a multidimensional, morphological classification of drainage basins, a rational basis for the selection of representative basins was developed. The procedures for this classification and selection were outlined and illustrated with an example from southeastern Nigeria. (Sims-ISWS)

ENTROPY CONCEPTS IN FLUVIAL GEOMORPHOLOGY: A REEVALUATION,
Lincoln College, (New Zealand). Tussock Grasslands and Mountain Lands Inst.
B. W. Davy, and T. R. H. Davies.
Water Resources Research, Vol. 15, No. 1, p 103-106, February 1979. 1 fig, 25 ref.

Descriptors: *Geomorphology, *Entropy, *Analytical techniques, *Fluvial sediments, Meanders, Channels, Channel morphology, Thermodynamics, Data processing, Mathematical models, Hydrology, Fluvial geomorphology.

The thermodynamic basis of entropy concepts as applied in fluvial geomorphology was examined closely. It was shown that the principle of minimum entropy production rate and the principle that the most probable state of a system is that which corresponds to a maximum of entropy are not applicable in stream situations. It was concluded that the use of entropy as an approach to stream behavior and sediment transport is of dubious validity. (Sims-ISWS)

DISSOLVED IRON--AN INDICATOR OF THE GROUNDWATER COMPONENT OF SMALL STREAMS DRAINING A GRANITE TERRAIN, SOUTH CAROLINA,
South Carolina Univ., Columbia. Dept. of Geology.
I. Kheoruenromne, and L. R. Gardner.
Water Resources Research, Vol. 15, No. 1, p 15-20, February 1979. 5 fig, 1 tab, 19 ref.

Descriptors: *Dissolved solids, *Iron, *Streams, *Groundwater, *South Carolina, On-site data collections, Model studies, Mathematical models, Streamflow, Runoff, Groundwater movement, Forests, Vegetation, Vegetation effects, Flow, Temporal distribution, Water quality, Hydrology.

The flow and dissolved iron content of two small streams draining a woodland basin and a recently deforested basin on a granite pluton in Kershaw County, South Carolina, were measured biweekly from September 1974 through August 1975. During spring and summer, the flow of the stream draining the deforested basin was reduced relative to that of the woodland basin because of the higher transpiration associated with rapid biomass accumulation by the newly established vegetation in the deforested basin. The observed relative reduction in flow was accompanied by a relative increase in iron concentration in the flow from the deforested basin. Analysis of the data also indicated that the rate of export of dissolved iron from both basins is independent of stream discharge. These observations suggested that the dissolved iron content of these streams is controlled by the dilution of iron-rich groundwater by essentially iron-free surface runoff and shallow interflow. A simple mixing model based on this hypothesis was developed and was found to fit the data. (Sims-ISWS)

CONSTRUCTION OF MODELS FOR FORECASTING AND CONTROLLING WATER QUALITY IN A RIVER BASIN ON PRINCIPLES OF SELF-ORGANIZATION,
Akademiya Nauk URSR, Kiev. Inst. Kibernetiki.
A. G. Ivakhenko.
In: American Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Kharkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 127-152, September 1978. EPA-600/9-78-024. 4 fig, 11 tab, 32 ref.

Descriptors: *River basins, *Forecasting, *Water quality, *Mathematical models, *Self-organization, *River flow, Annual, Monthly, Regression analysis, Equations, Systems analysis, Chlorides, Dissolved oxygen, Management, Reservoirs, Optimization, Discharge(Water), Harmonic trend, Optimum complexity, Dnieper River(USSR), Lagrangian polynomial, Linear polynomial.

The purpose of the research reported herein is to create mathematical models which adequately describe the dynamics of river basins and which are applicable both for forecasting and for deliberately changing and controlling the basins. Self-organization methods are considered the most promising mathematical models for identifying and controlling such systems. Work in this field from 1971 to 1975 was conducted at the Institute of Cybernetics of the Academy of Sciences, of the Ukraine. Construction of forecasting models for river basins developed for management purposes was also obtained at the VNIIVO Institute of the USSR Ministry of Land Reclamation and Water Use. Considered herein are: synthesis of models of the principle of self-organization; mathematical models for forecasting river flow; long-term forecast of the average annual flow of the Dnieper River; mathematical models for forecasting the quality of river water; and methods of managing the discharge of power plant reservoirs. Examples of methodological application are given, including forecasting of river flow with accuracy around 20%. Synthesis of the dynamics equations of the hydroelectrical power station discharge water reservoirs and the loss functions are shown. The equations obtained were used for synthesis of two-criteria management of the hydroelectric power station discharge in accordance with the ideas of multicriteria optimization. APPLICATIONS OF RECURSIVE ESTIMATION TECHNIQUES TO TIME VARIABLE HYDROLOGICAL SYSTEMS,
Institute of Hydrology, Wallingford (England).
P. G. Whitehead.
Journal of Hydrology, Vol. 40, No. 1/2, p 1-16, January 1979. 5 fig, 1 tab, 16 ref.

Descriptors: *Time series analysis, *Methodology, *Model studies, *Hydrologic systems, Rainfall-runoff relationships, River systems, Hydrology, Optimization, Equations, Mathematical models, Rivers, Algorithms, *Recursive estimation techniques, Time variable hydrological system, Maximum likelihood algorithms.

A flexible methodology was illustrated. The methodology used the recursive instrumental variable approximate maximum likelihood algorithms of time-series analysis to identify parameter variations and to characterize time-varying hydrological systems. The approach was developed for a single-input--single-output rainfall--runoff process and was extended to the multivariable situation for a river water quality system. (Lee-ISWS)

EFFICIENT SIMULATION OF NONLINEAR STEADY FLOW,
Hawaii Univ., Honolulu. Dept. of Ocean Engineering.
G. Niemeyer.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY3, Proceedings Paper 14420, p 185-195, March 1979. 3 fig, 12 ref, 2 append. NSF DES74-23005.

Descriptors: *Steady flow, *Rivers, *Model studies, Mathematical models, Computer models, Computer programs, Simulation analysis, Numerical analysis, Hydrodynamics, Finite element analysis, Equations, Flow, Hydraulics.

Numerical simulation of steady flow can require considerable computation. However, unique features of finite element and finite difference methods can be exploited, which leads to an efficient solution procedure. Although the resulting technique is fundamentally a time-stepping method, it achieves convergence within only a few steps. The considerable computational advantages of the method were obtained, moreover, without sacrificing the rigor of the governing equations, which were solved in their full nonlinear form. The technique was developed specifically for the vertically integrated Navier-Stokes equations. It was applied to simulate steady river flow. (Sims-ISWS)

INSTANTANEOUS UNIT HYDROGRAPH WITH NEGATIVE ORDINATES--POSSIBLE,
Technion - Israel Inst. of Tech., Haifa. Faculty of Industrial and Management Engineering.
A. Boneh, and A. Golan.
Water Resources Research, Vol 15, No 1, p 121-130, February 1979. 7 fig, 21 ref.

Descriptors: *Unit hydrographs, *Runoff, *Hydrology, Hydrography analysis, Equations, Mathematical studies, Mathematics, Surface runoff, Flow, Time, Precipitation excess, Storm runoff.

The answer to the question posed in the title of this paper is yes, provided that some restrictions are imposed on the rainfall excess which is the input to the surface runoff system. Obviously, impulsive inputs are not admissible when the instantaneous unit hydrograph (IUH) has negative ordinates, since the IUH is the direct surface runoff response (known as the 'output') to an instantaneous rainfall burst of unit volume and such runoff, by definition, cannot be negative. Is an instantaneous unit hydrograph with negative ordinates (IUHWNO) desirable. Now the answer is no, because of the restrictions that have to be imposed on the input. The purpose of this paper was not to justify the assumption of linearity, an assumption which is open to serious doubts, but rather to point out that IUHWNO can be of value if and when linearity of surface runoff systems is assumed. Two problems were considered: (1) The first is the ability of an IUHWNO to represent a real-world surface runoff system. A 'degenerate IUH' does not have this ability, and hence the term 'nondegenerate IUH' was carefully defined in the paper. Several conditions were derived in the paper which enable decision as to the degeneracy of a given IUHWNO. (2) The second problem is the determination of the class of admissible inputs in a surface runoff system which is represented by a given nondegenerate IUHWNO. These two problems are relevant to whether or not one should explicitly introduce nonnegativity sign constraints into the IUH ordinates in the identification of a surface runoff system from input-output records. Possible extensions to nonlinear and time-varying systems were considered in the paper for continuous or discrete-time systems. (Lee-ISWS)

A GEOMORPHIC MODEL FOR USE IN STREAMFLOW ROUTING,
Tennessee Valley Authority, Knoxville.
R. P. Betson.
Water Resources Research, Vol. 15, No. 1, p 95-101, February 1979. 4 tab, 24 ref.

Descriptors: *Streamflow, *Routing, *Geomorphology, *Model studies, Mathematical models, Regression analysis, Watersheds(Basins), Discharge(Water), Channels, Channel flow, Flow, Sediments, Sediment transport, Hydrology, Hydraulics.

Regression equations were presented for predicting parameters in the geomorphic equations that relate streamflow discharge at a site to channel width and cross-sectional area (from which velocity and hydraulic depth can be determined). Two measures were used in these regression equations, drainage area and channel slope, both of which were obtained from topographic maps. Regeneration and simulation tests at stream gage sites located in the Cumberland Plateau Physiographic Province indicated that at higher flows, this system of equations can predict width and area within about 25% about 2/3 of the time. These results appear to be comparable with or better than results that would normally be obtained from the reconnaissance field surveys normally used in streamflow routing for planning-level applications. INITIAL EFFECTS OF CLEARCUT LOGGING ON SIZE AND TIMING OF PEAK FLOWS IN A SMALL WATERSHED IN WESTERN OREGON,
Pacific Northwest Forest and Range Experiment Station, Corvallis, OR. Forest Sciences Lab.
R. D. Harr, and F. M. McCorison.
Water Resources Research, Vol. 15, No. 1, p 90-94, February 1979. 4 fig, 3 tab, 13 ref. NSF DEB74-20744 A06.

Descriptors: *Peak discharge, *Oregon, *Watersheds(Basins), *Lumbering, Forest watersheds, Snowmelt, Hydrology, Storm runoff, Model studies, Flow, Snow, Trees, *Clearcut logging.

Size of annual peak flow in a small watershed in western Oregon was reduced 32%, and average delay of all peak flows was nearly 9 hours following clearcut logging. Size of annual peak flows caused by rain with snowmelt was reduced 36%, and peak flows resulting from rain with snowmelt were delayed an average of nearly 12 hours following logging. Changes were attributed mainly to differences in short-term accumulation and melting of snow. No significant changes were detected in size or timing of peak flows that resulted from rainfall alone. COMPUTATION AND FORECAST OF THE SPRINGTIME FLOOD VOLUME IN THE VYATKA RIVER,
O. I. Krestovskiy.
Soviet Hydrology: Selected Papers, Vol 16, No 2, p 87-92, 1977. 3 fig, 2 tab, 7 ref. Translated from Trudy Gosudarstvennogo Gidrologicheskogo Instituta, No 233, p 15-26, 1977.

Descriptors: *Runoff, *Floods, *Flood forecasting, *Model studies, Mathematical models, Snowmelt, Precipitation(Atmospheric), Spring, Melt water, Soil water, Rivers, Forecasting, Flow, Flood discharge, *USSR, *Vyatka River(USSR).

A method for computing and forecasting springtime water losses and runoff depth during the flood period and the second quarter for the Vyatka River basin was described. It was developed on the basis of network observations of the Hydrometeorological Service over the period of 1936-1974. The proposed method is effective and based on the use of the autumn-winter river runoff and the depth of soil freezing in the field as indicators of the water storage capacity of the basin in spring. However, use of normal precipitation instead of actual precipitation for runoff forecasting reduces the effectiveness of the proposed method, since precipitation during the snow melting period can be smaller or greater by a factor of 5 than normal precipitation and runs off the entire basin with a runoff coefficient of 0.8-1.0. Therefore, the further improvement of forecasts of the spring runoff volume of the Vyatka River must be directed toward improving the method of forecasting spring precipitation. (Sims-ISWS)

RUNOFF-REGULATING PROPERTIES OF DRAINED FORESTS IN LATVIA,
Latvial Scientific Research Inst. of Forest Management Problems (USSR).
A. A. Ayre.
Soviet Hydrology: Selected Papers, Vol 16, No 2, p 173-175, 1977. 3 fig, 1 tab, 6 ref. Translated from Lesovedeniye, No 5, p 67-71, 1977.

Descriptors: *Runoff, *Drainage, *Forests, Soils, Soil types, Peat, Ditches, Rainfall, Precipitation(Atmospheric), Surface drainage, Trees, Forestry, *USSR, *Latvia.

The results of investigations of the runoff regime in the drained forests of Latvia were examined. The data obtained in small wooded drainage basins indicated that the relatively thin network of shallow ditches used at the present time to drain the forests does not cause adverse changes in river runoff. As compared to drained forests on hydromorphic mineral soils, the flood runoff from drained forests on peat soils is smoother, higher during the low-flow period, and more sustained. (Sims-ISWS)

INDUCED CHANNEL INSTABILITY AND HYDRAULIC GEOMETRY OF THE MANGAWHARA STREAM, NEW ZEALAND,
Waikato Univ., Hamilton (New Zealand). Dept. of Earth Sciences.
J. R. Bennett, and M. J. Selby.
Journal of Hydrology (New Zealand), Vol 16, No 2, p 134-147, 1977. 4 fig, 5 tab, 24 ref.

Descriptors: *Channel morphology, *Watersheds(Basins), *Streams, *Streamflow, Rivers, Channels, Hydraulic gradient, Erosion, Sedimentation, Forests, Pastures, Grasslands, Banks, Stability, Slope, Width, Meanders, Hydraulics, Hydrology, *Mangawhara Stream(New Zealand), *New Zealand, Forest clearing effects.

Approximately 50% of the Mangawhara catchment has been converted from forest to pasture in the last 50 years. Streamflow is now more responsive to intense rainfalls, and the supply of bedload to the channel has increased as a result of landsliding on the slopes. It has been suggested that increases in bedload and water discharge will be accompanied by increases in channel width, meander wavelength, and width-depth ratio and by a decrease in sinuosity. Changes in gradient and depth may be in either direction. For the Mangawhara, all recorded changes are as suggested, while both gradient and depth changes are small and of uncertain direction. Measures of the hydraulic geometry both at-a-station and downstream obey the laws established for rivers elsewhere. (Sims-ISWS)

WATER TEMPERATURES OF THE NGARURORO RIVER AT THREE STATIONS,
Ministry of Works, Napier (New Zealand). Water and Soil Div.
P. J. Grant.
Journal of Hydrology (New Zealand), Vol. 16, No. 2, p 148-157, 1977. 7 fig, 3 tab, 1 ref, 1 append.

Descriptors: *Water temperature, *Rivers, *Streamflow, Sampling, Measurement, On-site investigations, On-site data collections, Data processing, Correlation analysis, Regression anlysis, Temperature, Air temperature, Monthly, Foreign countries, Foreign research, Climatology, Hydrology, *New Zealand, *Ngaruroro River(New Zealand), *Kuripapango(New Zealand), *Whanawhana(New Zealand), *Fernhill(New Zealand).

From 349 random measurements of water temperature during 1961-76 at Kuripapango, Whanawhana, and Fernhill on the Ngaruroro River, it was found that both mean monthly and mean maximum monthly water temperatures at each station followed an annual cycle with respective amplitudes of about 12 C and 15 C, and they correlated highly with mean monthly air temperature at Napier. The number of months during which stated water temperatures may be exceeded at each station increased in the downstream direction. A 5-month thermographic record of water temperature supplemented random measurements to define the high temperature limits at Fernhill in relation to flow rates. Highest water tempertures are likely to occur in the 10-20 cu m/s flow range, and the indication was that below 10 cu m/s, the water temperatures decrease rather than increase. This phenomenon is probably the effect of channel underflows and is reinforced during recession by base flow. A temperature duration pattern and models for the prediction of daily maximum and daily minimum water temperatures at Fernhill were given. (Sims-ISWS)

DATING GROUND WATER.
Ground Water Age, Vol. 12, No. 11, p 29-30, July, 1978.

Descriptors: *Radioactive dating, *Ground water, Radioisotopes, Australia, Groundwater movement, Groundwater recharge, Groundwater mining, Groundwater basins, Deep percolation, Artesian aquifers, Desertification, Water management(Applied).

Radioisotope dating of ground water in Australia's Great Artesian Basin indicates that ground water is moving southwest towards south Australia at the rate of about one meter per year. If water from artesian wells is thousands of years old it will not be replenished rapidly enough to compensate for its withdrawal and is, in effect, being mined. Thus, dating of ground water can be a tool in ground water management and can help avoid desertification in areas such as Australia. (Purdin-NWWA)

PROCEEDINGS OF THE FIRST WORKSHOP ON SAMPLING GEOTHERMAL EFFLUENTS.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 067, Price codes: A11 in paper copy, A01 in microfiche. Report EPA-600/9-76-011, May 1976. Proceedings of a Workshop held October 20-21, 1975, Las Vegas, Nevada. 244 p.

Descriptors: *Geothermal studies, *Monitoring, *Sampling, *Thermal water, Steam, Pollutants, Gases, Chemicals, Water chemistry, Water quality, On-site investigations, On-site data collections, Data processing, Effluents, Brines, Radioisotopes, Groundwater, Wells, Water wells, Springs, Equipment, Instrumentation, Analytical techniques, Methodology, *Geothermal energy.

This was a compilation of papers presented at the first in a series of workshops on environmental monitoring of geothermal energy development held on October 20 and 21, 1975, at the Environmental Protection Agency's Environmental Monitoring and Support Laboratory in Las Vegas, Nevada. The purpose of this workshop was to generate the exchange of ideas and knowledge needed to develop a set of standard geothermal sampling methods with assurance of quality in those methods. Representatives of industry, universities, and government presented 19 technical papers, 12 of which were published in this document. Their content and the discussions which followed the presentations provided guidance for developing a recognized Referenced Sampling Method Handbook. (See W79-06053 thru W79-06064) (Sims-ISWS)

P. Kruger.
In: Proceedings of the First Workshop On Sampling Geothermal Effluents; Workshop held October 20-21, 1975, Las Vegas, Nevada. Report EPA-600/9-76-011, p 1-35, May 1976. 7 tab, 12 ref.

Descriptors: *Thermal water, *Geothermal studies, *Energy, Projects, Research and development, Heat, Temperature, Heated water, Groundwater, Water quality, Reviews, Geothermal energy, Energy resources.

The Nation has embarked on an aggressive program to develop its indigenous resources of geothermal energy. For more than a decade, geothermal energy has been heralded as one of the more promising forms of energy alternate to oil and gas for electric power generation, but during the last 15 years, the total capacity in the U.S. has reached 502 MWe, about half the size of a single modern nuclear power plant. The upper 10 km of the earth's crust may contain more than 3 x 10 to the 26th power cal of heat, a resource base readily classified as vast. However, much of this energy is too diffuse to be exploitable as an energy source. Geothermal resources may be defined as localized deposits of geothermal heat concentrated at attainable depths, in adequate volumes, and at temperatures sufficient for commercial exploitation. The National Geothermal Program was described. (See also W79-06052) (Sims-ISWS)

THE SALINITY PROFILE OF THE EAST MESA FIELD AS DETERMINED FROM DUAL INDUCTION RESISTIVITY AND SP LOGS,
Bureau of Reclamation, Boulder City, NV. Region 3.
R. T. Littleton, and E. E. Burnett.
In: Proceedings of the First Workshop On Sampling Geothermal Effluents; Workshop held October 20-21, 1975, Las Vegas, Nevada. Report EPA-600/9-76-011, p 114-125, May 1976. 9 fig.

Descriptors: *Geothermal studies, *Thermal water, *Salinity, Wells, Water wells, Density, Brines, Salts, Electrical conductance, Water quality, Porosity, Groundwater, On-site investigations, Drill stem testing.

In a water-dominated geothermal reservoir such as the East Mesa Field, it is practical to obtain the general dimensions of dissolved mineral concentration by interpretation of dual induction resistivity logs and self-potential logs. Values so obtained may be substantially greater or less than those obtained by laboratory analyses of water samples from the same zones. Therefore, it is necessary to establish calibrating coefficients by borehole sampling and laboratory analyses. (See also W79-06052) (Sims-ISWS)

Descriptors: *Geothermal studies, *Thermal water, *Steam, *Sampling, *California, On-site investigations, On-site data collections, Radioisotopes, Radium radioisotopes, Powerplants, Water, Gases, Geysers, Hydrogen sulfide, Chemicals, Analytical techniques, Methodology, *The Geysers(CA), Fumaroles, Radon.

A sampling program for radioactive effluents from The Geysers geothermal power plant was described. Radon-222 was sampled both in the noncondensable fraction of geothermal steam and in the atmosphere. A variety of solid and liquid matrices, including steam condensate, cooling tower sludge, soil, and grass, were sampled and analyzed for 226Ra and 210Pb. The three radioactive isotopes 222Rn, 226Ra, and 210Pb are members of the naturally-occurring 238U radioactive decay chain. Stack sampling techniques were applied to the collection of steam, and a simple sampling train was constructed to separate and collect the condensable and non-condensable fractions. Collection techniques for selected solid and liquid matrices were described. Two complicating factors in the sampling and analysis program were addressed: the collection of atmospheric samples for radon from a local source in the presence of the natural background, and the long-term temporal variation in the emission rate of contaminants from a geothermal field. The sampling and analytical methods used were capable of detecting 222Rn, 226Ra, and 210Pb at environmental concentrations that are below the allowable maximums set in State of California regulations. ATMOSPHERIC DISCHARGE SAMPLING WHILE DRILLING GEOTHERMAL STEAM WELLS,
Frederiksen Engineering Co., Oakland, CA.
M. H. Hyman, and G. R. Fox.
In: Proceedings of the First Workshop On Sampling Geothermal Effluents; Workshop held October 20-21, 1975, Las Vegas, Nevada. Report EPA-600/9-76-011, p 175-180, May 1976. 2 fig.

Descriptors: *Geothermal studies, *Steam, *Sampling, Gases, Suspended solids, Separation techniques, Air pollution, Pollution abatement, Pollutants, Hydrogen sulfide, Mercury, Ammonia, Drilling, Wells, Noise, Scrubbers, Steam wells.

During the final phases of drilling live geothermal steam wells, considerable amounts of particulate (rock dust) and vapors are discharged. Abatement of particulates, gases, and noise was accomplished with water injection and utilization of centrifugal separators. A special method of sampling for particulates while drilling, even when active steam formations are encountered, was proved to be successful. The sampling train employed also was useful for source testing of hydrogen sulfide, mercury vapor, and ammonia. (See also W79-06052) (Sims-ISWS)

UNION OIL COMPANY OF CALIFORNIA'S GEOTHERMAL SAMPLING TECHNIQUES,
Union Oil Co. of California, Brea.
D. J. Christofferson, R. N. Wheatley, and J. A. Baur.
In: Proceedings of the First Workshop On Sampling Geothermal Effluents; Workshop held October 20-21, 1975, Las Vegas, Nevada. Report EPA-600/9-76-011, p 165-173, May 1976. 8 fig.

Descriptors: *Geothermal studies, *Sampling, *Chemical analysis, *Steam, Chemicals, Gases, Analytical techniques, Methodology, Ammonia, Methane, Nitrogen, Hydrogen sulfide, Carbon dioxide, Equipment, Instrumentation.

The purpose was to describe the procedures used by Union Oil Company to sample and analyze produced geothermal steam for total composition. As is the case in any analytical problem, representative, accurate sampling is essential to the problem solution. Sampling-produced geothermal steam is no exception to this rule. The sample matrix that was dealt with was mainly water; and an analysis was done for gaseous and other compounds, some of which are highly soluble in water and some of which are relatively insoluble. The sampling and analysis for these compounds were described. (See also W79-06052) (Sims-ISWS)

SAMPLING AND PRESERVATION TECHNIQUES FOR WATERS IN GEYSERS AND HOT SPRINGS,
Geological Survey, Menlo Park, CA.
J. W. Ball, E. A. Jenne, J. M. Burchard, and A. H. Truesdell.
In: Proceedings of the First Workshop on Sampling Geothermal Effluents; Workshop held October 20-21, 1975, Las Vegas, Nevada. Report EPA-600/9-76-011, p 218-234, May 1976. 7 fig, 10 ref.

Descriptors: *Geothermal studies, *Sampling, *Chemical analysis, Preservation, Geysers, Springs, Thermal waters, Gases, Chemicals, Hydrogen ion concentration, Oxidation-reduction potential, Temperature, Dissolved oxygen, Silica, Instrumentation, Equipment, Water chemistry, *Sample preservation.

Sampling of geothermal fluids presents unique challenges due to the instability and wide concentration range of many constituents. Unstable parameters, such as pH, Eh, temperature and dissolved oxygen, are determined on-site. Filtration of geothermal water is done with absolute minimum time-delay and exposure of the sample to air, by using a portable pump and non-contaminating, all-plastic or all-metal filter apparatus, for samples for inorganic or organic determinations, respectively. Sample preservatives and their safe, efficient transportation were discussed. Two techniques of geothermal gas collection were presented along with details of gas sampling apparatus. DETERMINATION OF THE MECHANISM OF RECHARGE IN THE LOS NARANJOS AREA IN MEXICO USING ENVIRONMENTAL ISOTOPE TECHNIQUES,
International Atomic Energy Agency, Vienna (Austria).
B. R. Payne, and I. S. Ortiz.
Water Resources Research, Vol. 15, No. 1, p 171-175, February 1979. 2 fig, 1 tab, 3 ref.

Descriptors: *Isotope studies, *Groundwater recharge, *Rivers, *Mexico, Recharge, Natural recharge, Discharge(Water), Evaporation, Precipitation(Atmospheric), Runoff, Infiltration, Groundwater, Oxygen isotopes, Deuterium, Sampling, Data processing, *Mexico, *Rio Blancio(Mexico).

The Rio Blanco crosses a coastal plain south of Veracruz in Mexico, and discharge measurements suggested that the river is recharging the groundwater system. The estimated evapotranspiration is very close to the mean annual precipitation, so estimates of effective recharge by infiltration of precipitation are imprecise. The variations in the stable isotopic composition (D and 18 O) of surface and groundwater samples were used to estimate the relative importance of the two sources of recharge to the groundwater system. The data indicated that recharge by infiltration of precipitation is the dominant source of recharge. This conclusion was based upon measurements from individual wells and also on the base flow of rivers originating in the plain, thus providing an estimate integrated over the area drained by the rivers. A generalized Darcy's law for nonuniform flows in which the pressure gradient depends on the velocity and its derivatives was adopted. The permeability coefficient, as well as a new coefficient, was investigated with the aid of the averaged dissipation equation. The additional coefficient appearing in the generalized law was estimated with the aid of a cell model, and the generalized law was employed in order to solve a few problems (Couette flow past a porous boundary, refraction at the boundary between two porous samples, and flow around a thin partition). Deviations from Darcy's law were found to be confined to thin layers near the medium boundaries. (Sims-ISWS)

GROUNDWATER RECHARGE AND PALEOCLIMATE IN THE SIRTE AND KUFRA BASINS, LIBYA,
Institute of Geological Sciences, Wallingford (England).
W. M. Edmunds, and E. P. Wright.
Journal of Hydrology, Vol 40, No 3/4, p 215-241, February 1979. 6 fig, 4 tab, 31 ref.

Descriptors: *Groundwater recharge, *Paleoclimatology, *Stable isotopes, *Radioisotopes, *Groundwater basins, *Radioactive dating, *Africa, Age, Aquifers, Groundwater, Rainfall, Monsoons, Evaporation, Deserts, Arid climates, Water quality, Sampling, Freshwater, Foreign countries, Foreign research, *Libya, *Sirte Basin(Libya), *Kufra Basin(Libya).

Stable and radio-isotope results (C, H, O) for groundwaters from the Sirte and northern Kufra basins were used to determine the recharge history during the Holocene and late Pleistocene. Radiocarbon ages were corrected on the basis of their stable carbon isotope ratios and on environmental samples from the areas. Two groups may be recognized, (1) low 14C activity groundwaters (13000-34000 yr BP) with delta 13C -5.6 to -11.7 parts per thousand; and (2) higher 14C activity groundwaters (5000-7800 yr BP) enriched in 13C up to delta 13C = -3.2 parts per thousand. A well-defined freshwater (less than 50 mg/l Cl(-)) channel can be traced within the aquifer for some 130 km through the region, which is considered to represent recharge from a former wadi. This water, with an age of + or - 7800 yr BP, is chemically and isotopically distinct from the regional groundwaters and provides direct evidence of a significant recharge event during the Holocene. The stable isotope (O and H) composition of groundwater from the Kufra and Sirte basins are all related by an evaporative line with slope delta D = 4.5 delta 180 - 35 with an intercept on the meteoric line of -11 parts per thousand. The spatial and temporal distribution of groundwaters in rela-

tion to the evaporative line suggests a progressive change in character of the recharge, which is controlled by a shift towards strongly convective rainfall during the Holocene. (Visocky-ISWS)

ESTIMATING SEEPAGE FROM A RESERVOIR FROM CHANGE IN HYDRAULIC HEAD,
Science and Education Administration, Chickasha, OK.
J. W. Naney, and T. B. Thompson.
Journal of Hydrology, Vol. 40, No. 3/4, p 201-213, February 1979. 8 fig, 1 tab, 12 ref.

Descriptors: *Seepage, *Reservoirs, *Oklahoma, On-site data collections, Groundwater movement, Floodwater, Groundwater, Water levels, Dams, Structures, Hydrologic budget, Hydrogeology, Evaporation, Observation wells, Flow nets, Geology, Hydraulic head.

An investigation of seepage below floodwater-retarding structures resulted in a method for estimating seepage from a reservoir based upon change in head. A typical structure was selected for the study, and physiographic and geologic features of the site were identified. Extensive hydrologic and hydrogeologic data were collected and analyzed for the site. A major inflow event was recorded in the reservoir in September 1965, and data from that event were used to develop an equation for estimating the amount of seepage lost from the structure in relation to the hydraulic head behind the structure. The method presented by the authors provides a physically based method for estimating the impact of a reservoir on the groundwater flow system assuming variable reservoir head conditions. BOUNDARY SOLUTIONS TO TWO PROBLEMS IN POROUS MEDIA,
Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
P. L-F. Liu, and J. A. Liggett.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 105, No HY3, Proceedings Paper 14419, p 171-183, March 1979. 12 fig, 1 tab, 10 ref, 2 append. NSF ENG77-01479.

Descriptors: *Groundwater movement, *Porous media, *Groundwater recharge, *Model studies, Mathematical models, Numerical analysis, Groundwater, Recharge, Saturated flow, Boundary processes, Equations, Dams, Dikes, Soil surfaces, Soil water, Soil water movement.

The boundary integral equation method (BIEM) was used to solve free surface groundwater problems. The formulation included those problems in which the domain of the solution is infinite. Two methods were presented which treat infinite domains efficiently using the BIEM. These methods were illustrated by a two-dimensional recharge problem and by the flow through a dike on a pervious foundation. The BIEM solutions were compared to experimental data. Excellent agreement was observed. (Sims-ISWS)

A NOTE ON ESTIMATING FINITE DIFFERENCE INTERBLOCK HYDRAULIC CONDUCTIVITY VALUES FOR TRANSIENT UNSATURATED FLOW PROBLEMS,
Universite Scientifique et Medicale de Grenoble (France). Inst. de Mecanique.
R. Haverkamp, and M. Vanclin.
Water Resources Research, Vol 15, No 1, p 181-187, February 1979. 3 fig, 1 tab, 19 ref.

Descriptors: *Hydraulic conductivity, *Unsaturated flow, *Groundwater, *Model studies, Mathematical models, Groundwater movement, Flow, Infiltration, Soils, Soil water, Soil water movement, Moisture content, Hydrology, Finite difference methods.

Nine different methods of weighting interblock hydraulic conductivity values used for modeling one-dimensional water transfer in homogeneous, unsaturated soil were tested for their influence upon the accuracy of the finite difference solution. On the basis of these results, the most suitable weighting relation was selected. In a first stage, the numerical results obtained by the models using the various conductivity weighting formulas were compared with the quasi-analytical solution developed by Philip for a clay soil. In a second stage, the models were used to simulate a laboratory experiment carried out on a sandy soil. In both cases, rather drastic boundary conditions were applied. It appears clearly from these tests that the weighting errors are of critical influence on the accuracy of solution. As proposed in this note, the geometric mean taken over two adjacent hydraulic conductivity values is the only weighting method that generates little weighting error. The latter weighting relation was found to be preferable in terms of flexibility, precision, and feasibility. (Sims-ISWS)

UNSTEADY GROUNDWATER FLOW ON SLOPING BEDROCK,
Thessaloniki Univ., Salonika (Greece). Faculty of Technology.
C. N. Frangakis, and C. Tzimopoulos.
Water Resources Research, Vol 15, No 1, p 176-180, February 1979. 4 fig, 11 ref.

Descriptors: *Groundwater, *Unsteady flow, *Bedrock, *Model studies, Mathematical models, Groundwater movement, Discharge(Water), Flow, Slopes, Equations, Numerical analysis, Analytical techniques, Galerkin's method.

A numerical model based on the equation describing the unsteady groundwater flow on impervious sloping bedrock was formulated. The case which was studied concerned the groundwater flow from one canal to another with a sudden rising of the canal level as an upstream boundary condition, while the downstream level remained constant. Initially, at time $t = 0$, both levels were equal. The numerical model used the finite element technique with Galerkin's method. The stability and accuracy of the method were proven by comparison of numerical results with the Crank-Nicolson scheme. The algorithm developed for the finite element technique gave the same results as the one for the finite difference scheme. The effect of inclination of lower impervious boundary on outflow rate was studied. (Sims-ISWS)

MODELS OF GROUNDWATER FLOW IN STATISTICALLY HOMOGENEOUS POROUS FORMATIONS,
Tel Aviv Univ. (Israel). School of Engineering.
G. Dagan.
Water Resources Research, Vol 15, No 1, p 47-63, February 1979. 7 fig, 13 ref, 1 append.

Descriptors: *Groundwater, *Groundwater movement, *Porous media, *Model studies, Mathematical models, Flow, Permeability, Storage, Soils, Soil water, Soil water movement, Hydraulic conductivity, Statistics, Statistical models, Stochastic processes, Steady flow, Unsteady flow, Pressure head, Soil science.

Most natural porous formations display significant variations in space of permeability, K, and storativity, S. Such formations are regarded as random structures characterized by the permeability frequency distribution and its autocorrelation. With the aid of three basic length scales (L sub 1, microscale; L sub 2, integral scale of K autocorrelation; and L sub 3, length scale of space change of average K) a classification of aquifers was suggested. A similar classification was proposed for the flow regimes. The study was limited to statistically homogeneous or slowly varying formations (L sub 2 much less than L sub 3) and to uniform or slowly varying (in space and time) flows. In the section dealing with steady flows, effective permeability, as well as variances of head gradient, specific discharge, and head, was computed for one-, two-, and three-dimensional flows. Bounds and an estimate of the effective permeability in terms of a log normal permeability distribution were given. The computations were based on physical, simplified models of formation structure. It was shown that the head variance is grossly overestimated for one-dimensional flow through blocks 'in series', and the same is true for specific discharge for layers 'in parallel'. The two- and three-dimensional variances are much lower and are close to each other. The unsteady flow was analyzed with the aid of the relaxation time needed for blocks of different K, S to adapt to the environment. For flows which change slowly and uniformly, the effective permeability is that derived for steady uniform flows, and the effective storativity is equal to the S arithmetic mean. The head gradient variance computed with the aid of some physical models was compared with that of steady uniform flow, and it was shown that for sufficiently slow time changes, the flow field can be considered momentarily uniform. Ground water in the upper Winooski River basin, Vermont, occurs in bedrock and in overlying unconsolidated deposits of glacial origin. Bedrock in the area is composed of a series of metamorphic and igneous rocks. Median yield for 126 wells in four different bedrock formations ranges from 5 to 6 gallons per minute, and median depth ranges from 130 to 200 feet. Lineaments, interpreted as fracture of breakage zones in bedrock, were mapped to identify zones where well yields are expected to be higher than average. Unconsolidated deposits in the upper Winooski River basin include unsorted till, water-sorted clay, silt, sand, and gravel. Properly constructed wells in saturated deposits of sand or gravel having high permeability can yield large quantities of water. Twenty-six domestic wells in these unconsolidated deposits have a median yield of 18 gallons per minute and a median depth of 58 feet. Chemical analysis of water from six wells indicate a median hardness of 120 milligrams per liter, (as CaCO3), which is moderately hard. Iron and manganese are common constituents of ground water in the area, and several analyses show concentrations of these elements which exceed recommended National Academy of Sciences and National Academy of Engineering (1973) limits for public drinking water supplies. FINITE-ELEMENT ANALYSIS OF THE TRANSPORT OF WATER AND SOLUTES IN TILE-DRAINED SOILS,
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
J. F. Pickens, R. W. Gillham, and D. R. Cameron.
Journal of Hydrology, Vol. 40, No. 3/4, p 243-264, February 1979. 12 fig, 1 tab, 25 ref.

Descriptors: *Finite element analysis, *Groundwater movement, *Ion transport, Numerical analysis, Mathematical models, Solutes, Porous media, Saturated flow, Unsaturated flow, Tiles, Drains, Soils, Theoretical analysis, Water pollution, Leaching, Model studies, Galerkin technique, Solute transport.

The finite-element method based on a Galerkin technique was used to formulate the problem of simulating the two-dimensional (cross-sectional) transient movement of water and solute in saturated or partially saturated nonuniform porous media. The numerical model utilizes linear triangular elements. Nonreactive as well as reactive solutes whose behavior can be described by a distribution coefficient or first-order reaction term were considered. The flow portion of the model was tested by comparison of the model results with experimental and finite-difference results for transient flow in an unsaturated sand column, and the solute transport portion of the model was tested by comparison with analytical solution results. The model was applied to a hypothetical case involving movement of water and solutes in tile-drained soils. The simulation results showed the development of distinct solute leaching patterns in the soil as drainage proceeded. Although applied to a tile drainage problem in this study, the model should be equally useful in the study of a wide range of two-dimensional water and solute migration problems. (Visocky-ISWS)

SEMINUMERICAL SIMULATION OF SINGLY DISPERSIVE CONVECTION IN GROUNDWATER,
Technion - Israel Inst. of Tech., Haifa. Dept. of Civil Engineering.
H. Rubin.
Journal of Hydrology, Vol 40, No 3/4, p 265-281, February 1979. 5 fig, 22 ref, 1 append.

Descriptors: *Numerical analysis, *Convection, *Dispersion, *Groundwater, *Thermal water, Geothermal studies, Currents(Water), Water circulation, Mathematical models, Equations, Aquifers, Groundwater movement, Temperature, Model studies, *Israel.

Geothermal activity may lead to convection currents in groundwater. Such currents considerably affect transport phenomena in the aquifer. In this study, the applicability of a seminumerical approach for the simulation of flow conditions in such an aquifer was presented. Flow field variables are expanded through truncated sets of eigenfunctions, which leads to a system of general first-order differential equations that can be solved by applying available subroutines. Criteria of flow field stability, parameters affecting flow conditions, and quantitative analysis of transport processes in the aquifer were studied. (Visocky-ISWS)

The applicability of the Theis-formula and the Jacob-Hantush leakage-formula as tools for the description of water-level variations due to pumping from artesian aquifers was shown to be rather limited, especially in long-term pumping situations. The limitations were discussed and illustrated through a review of some mathematical models with more reliable and physical realistic preconditions, and a general perception of the physics governing the drawdowns in pumping from leaky artesian aquifers was established. Data from 10 years of heavy pumping from a leaky artesian multi-aquifer at Egebjerg near Horsens, Denmark, were analyzed, and the result turned out to be in good agreement with the theoretical discussion. A WATER MANAGEMENT MODEL FOR SHALLOW WATER TABLE SOILS,
North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
R. W. Skaggs.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 641, Price codes: A10 in paper copy, A01 in microfiche. Water Resources Research Institute, University of North Carolina, Raleigh. Report No 134, November, 1978. 178 p, 57 fig, 29 tab. OWRT A-086-NC(4). 14-34-0001-7070.

Descriptors: *Water management, *Surface drainage, Subsurface drainage, Subsurface irrigation, *Computer models, Soil moisture, Water table, *Soil water movement.

A study was conducted to develop and test a water management model, DRAINMOD, for shallow water table soils. The objective was to develop a model for soils that normally require artificial drainage, either surface or subsurface, for efficient crop production. The model has the capability of simulating on a day-to-day, hour-by-hour basis the table position, soil water content, drainage ET and surface runoff in terms of climatological data, soil properties, crop parameters, and the water management system design. By simulating the performance of alternative system designs over several years of record, an optimum water management system can be designed. The basis of the model is a soil water balance in the soil profile. It is composed of a number of separate components, incorporated as subroutines to evaluate various mechanisms of water movement and storage in the soil profile. These components include methods to evaluate infiltration, subsurface drainage, surface drainage, potential evapotranspiration (ET), actual ET, subirrigation and soil-water distribution. Approximate methods were used for each component so that the required inputs would be simplified and consistent with available data. The model was constructed so that improved methods can easily be substituted for existing components as they become available. (Kiger-North Carolina)

DIRECT IN-FIELD MEASUREMENT OF NITROUS OXIDE FLUX FROM SOILS,
California Univ., Riverside. Dept. of Soil and Environmental Science.
J. C. Ryden, L. J. Lund, and D. D. Focht.
Soil Science Society of America Journal, Vol 42, No 5, p 731-737, September-October, 1978. 2 fig, 5 tab, 29 ref.

Descriptors: *Denitrification, *Nitrates, Gas chromatography, Measurement, Fertilization, Ozone, Methodology, Data collections.

A method was developed whereby nitrous oxide N2O effusing from a soil surface could be contained and selectively trapped for subsequent analysis. The methodology proposed provides a direct measurement of N2O flux which is integrated over the sampling period used. The methodology is sufficiently simple that it embodies a monitoring capability which can be used to measure N2O evolution in on-going agricultural practice. The method may also provide a basis for the direct measurement of total N loss as a result of denitrification, if the further reduction of N2O can be inhibited. (Skogerboe-Colorado State)

A RAPID METHOD FOR ESTIMATING THE NITROGEN-SUPPLYING CAPABILITY OF A SOIL,

Pennsylvania State Univ., University Park. Dept. of Agronomy.
R. H. Fox, and W. P. Piekielek.
Soil Science Society of America Journal, Vol 42, No 5, p 751-753, September-October, 1978. 2 fig, 1 tab, 8 ref.

Descriptors: *Nitrogen, Nutrient requirements, Fertilization, Nutrients, Crop response, Corn, Correlation analysis, *Soil tests.

Nitrogen fertilizer recommendations in humid regions have been primarily based on crop N requirements without regard for the variability in the N-supplying capability of the soil. The authors found that two previously proposed N availability indexes, 0.01M NaHCO3 and boiling 0.01M CaCl2 extractable N, were well correlated (r=0.77 and 0.86, respectively; $P < 0.01$ for both) with the capability of eight Pennsylvania soils to supply N to field grown corn, (Zea mays L.). However, the time and expense required for these analyses may preclude routine use by soil testing laboratories. In seeking ways to shorten and simplify the analyses, it was found that the ultraviolet (UV) absorption by the 0.01M NaHCO3 soil extract at 260 nm was as well correlated with the N-supplying capability of the test soils ($r = 0.865$ $P < 0.01$) as the best of the previously evaluated extractable N indexes. This new method is as rapid, simple, and inexpensive as the methods currently used to measure availability of other essential nutrients in the soil. It was also demonstrated how this method can be used to predict more accurately the fertilizer N needs for corn. (See also W79-06160) (Skogerboe-Colorado State)
W79-06159

FIELD TESTING OF SEVERAL NITROGEN AVAILABILITY INDEXES,
Pennsylvania State Univ., University Park. Dept. of Agronomy.
R. H. Fox, and W. P. Piekielek.
Soil Science Society of America Journal, Vol 42, No 5, p 747-750, September-October, 1978. 2 fig, 3 tab, 9 ref.

Descriptors: *Nitrogen, Fertilization, *Soil tests, Crop production, Chemical analysis, Crop response, Corn.

Eight N availability indexes were correlated with the capability of eight Pennsylvania soils to supply N to field-grown corn (Zea mays L.) in 1976 and 1977. Boiling 0.01M CaCl2 and 0.01M NaHCO3-extractable N were both significantly correlated at the 1% level ($r = 0.86$ and 0.77, respectively) with the N-supplying capability of the soils from the combined 1976 and 1977 experiments. Autoclave-extractable NH4-N and total soil N were significantly correlated with the soil supplying capability at the 5% confidence level ($r = 0.70$ and 0.68, respectively). Walkley-Black soil organic matter, soil NO3(-), and H2SO4-extractable and KCl-extractable N were not significantly correlated with N availability in the field. Though four of the indexes were well correlated with the N availability in the soil, time and expense necessary for these analyses may preclude routine use by soil testing laboratories. (Skogerboe-Colorado State)

SOIL WATER IN SOUTHWESTERN MINNESOTA: FOUR STAGES,
Minnesota Univ., St. Paul. Dept. of Soil Science.
D. G. Baker, and W. W. Nelson.
Journal of Soil and Water Conservation, Vol. 34, No. 1, p 28-30, January-February 1979. 2 fig, 2 tab, 8 ref.

Descriptors: *Soil water, *Recharge, *Consumptive use, *Minnesota, On-site investigations, On-site data collections, Data processing, Frozen soils, Crops, Corn, Soybeans, Evapotranspiration, Evaporation, Seasonal, Temperature, Precipitation(Atmospheric), Discharge(Water), Climatology.

A unique series of soil water records from a southwestern Minnesota watershed show how and with what efficiency precipitation is used. These records, now covering 17 years (1960-1976), include years of climatic extremes that range from periods of surplus precipitation to the drought of 1976. The watershed is in the western Corn Belt where soils seldom recharge completely with water. While unusual in most of the Corn Belt, this recharge condition is common over half the United States. In addition to the soil water records, associated data were available that permit investigation of the area's climatology and hydrology. (Sims-ISWS)

Water Resources Research, Vol 15, No 1, p 107-112, February 1979. 3 fig, 1 tab, 6 ref.

Descriptors: *Pores, *Soil moisture, *Moisture content, *Statistical models, Probability, Mathematical models, Distribution patterns, Curves, Air-water interfaces, Equations, Capillary action, Saturation, Retention, Theoretical analysis, Pore radius, Suction.

Most pF curves are shaped as cumulative distribution functions. From this observation, restricted to nonshrinking or swelling soils, a close relationship was established between the moisture characteristic and the pore size referred to as the effective pore radius. For many soils showing a moisture characteristic similar to a normal cumulative distribution function, the derived pore size distribution is log normal. In this case, a direct identification technique was developed which yields the parameters of the density function from the experimental pF theta relationship. Practical applications demonstrated the validity of this probabilistic model, which gives good agreement with morphometric pore size data available in the literature. The model also gives rise to an analytical expression for the pF curve in terms of two structural parameters of the porous system, the mean and the standard deviation of the effective pore radius. ESTIMATION OF THE ERROR IN THE DETERMINATION OF SOIL WATER STORAGE AT OBSERVATION POINTS,
N. Ye. Leonova.
Soviet Hydrology: Selected Papers, Vol. 16, No. 2, p 98-101, 1977. 3 fig, 3 tab, 3 ref. Translated from Trudy Gosudarstvennogo Gidrologicheskogo Instituta, No. 233, p 118-126, 1977.

Descriptors: *Soil water, *Water storage, *Flood forecasting, Floods, Runoff, Snowmelt, Melt water, Soils, Soil types, Crops, Agriculture, Rivers, Drainage, Storage, *USSR, Error estimation.

In forecasting and computing springtime flood runoff, the question arises as to the accuracy of determination of the major flood-forming factors, which are the water equivalent of snow and the wetting and freezing of the soil. The computed estimates of errors in the determination of the average water storage in soil using long-period observations of soil moisture in the Don River basin upstream of Kazanskaya village and of observations over 5 years by the expedition of the State Hydrological Institute in small drainage areas of this basin lead to the following conclusions: (1) Errors in the initial data on the water storage in soil, determined in the areas of agrometeorological stations under homogeneous crops, are close to the permissible limit (delta = 0.5) or exceed it, amounting to 8-18% (0- to 30-cm layer), 7-12% (0- to 50-cm layer), and 6-9% of the average (0- to 100-cm layer). (2) Errors in the initial data on water storage, averaged over several areas of agrometeorological stations, on average water storage determined on 3-km courses in small drainage areas of 2000-5000 sq km, and on water storage measured at individual points on these courses are within permissible limits. (3) Annual average water storage in soil under winter crops is determined least accurately in June in the upper soil horizons. This is associated with an increase in the variations in soil moisture as a result of uneven soil drying. (Sims-ISWS)

ROLE OF HYDROPHYSICAL SOIL PROPERTIES IN SPRING FLOOD RUNOFF LOSSES,
I. L. Kalyuzhnny, K. K. Pavlova, and N. V. Sokolova.
Soviet Hydrology: Selected Papers, Vol. 16, No. 2, p 102-107, 1977. 3 fig, 2 tab, 10 ref. Translated from Trudy Gosudarstvennogo Gidrologicheskogo Instituta, No. 233, p 127-136, 1977.

Descriptors: *Soil properties, *Soil water, *Water storage, *Floods, Flood forecasting, Soils, Soil types, Infiltration, Permeability, Porosity, Storage, Forest soils, Agriculture, Frozen soils, Runoff, Drainage, Melt water, Snowmelt, *USSR.

The volume and dynamics of meltwater losses by infiltration are determined by the infiltration capacity of soils in a drainage basin. Under certain soil temperature to soil moisture ratios, the infiltrating water can clog all the water-conducting pores and the soil becomes impermeable, forming a so-called barrier layer. The problem of the conditions under which the ice forming during the crystallization of infiltrating water is capable of clogging all the water-conducting pores has been solved thermo-physically and made practically usable. Forest soils are highly permeable and a barrier layer forms extremely rarely in them. Field soils are less permeable and a barrier layer forms fairly frequently in their upper layers during warm spells in winter and during the snow melting period in spring. The losses and coefficient of spring flood runoff in wooded basins are determined mainly by the soil moisture deficit in the pre-spring period and are virtually independent of soil freezing depth. The main factors determining the magnitude and dynamics of meltwater losses by infiltration in the field are the depth of freezing and degree of wetting of the soil and also its thermal properties. The water storage in the upper meter of soils in the field and forest during the pre-spring period are similar, but the soil moisture deficit is greater in the forest. Soil water storage varies in the course of the winter, and its greatest increase is observed in winters with warm spells. (Sims-ISWS)

TIME AND LENGTH SCALES FOR THE ONE-DIMENSIONAL ASSUMPTION AND ITS RELATION TO ECOLOGICAL MODELS,
Army Engineer Waterways Experiment Station, Vicksburg. Environmental Effects Lab.
D. E. Ford, and K. W. Thornton.
Water Resources Research, Vol. 15, No. 1, p 113-120, February 1979. 4 fig, 68 ref.

Descriptors: *Model studies, *Temporal distributions, *Spatial distributions, Ecology, Lakes, Reservoirs, Oceans, Waves(Water), Temperature, Water temperature, Biology, Chemistry, Hydrodynamics, Mathematical models, Statistical models.

The vertical one-dimensional assumption was examined with respect to its validity for mathematical ecological models of lakes or reservoirs. Analysis of the time and length scales characterizing the hydrodynamics, chemistry, and biology showed that the 2 scales are inexorably coupled, and their interaction dictated both upper and lower bounds for the lake size that can be characterized by a one-dimensional model. For an update frequency or forcing time scale of 1 day, the one-dimensional model was restricted to lakes characterized by length scales of 0.5-10 km. This range is preliminary and dependent on model formulation and update frequency. Inconsistencies between the model formulation scales for the hydrodynamics, chemistry, and biology may result in erroneous model predictions. (Sims-ISWS)

SALINITY TRANSPORT BETWEEN LAYERS OF A STRATIFIED SHEAR FLOW,
Utah State Univ., Logan. Dept. of Civil and Environmental Engineering.
J. Freitas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 652, Price codes: A04 in paper copy, A01 in microfiche. MS thesis, February 1979, 68 p, 7 tab, 2 append., 6 fig. OWRT B-139-UTAH(3), 14-34-0001-7191.

Descriptors: *Saline lakes, Saline water systems, *Stratified flow, Hydrodynamics, Parametric hydrology, Entrainment, Great Salt Lake, Pycnocline, Richardson number.

In order to effectively manage the Great Salt Lake and its tributaries, an advanced knowledge of the hydrodynamic processes occurring within this body of water must be available. A research project was undertaken to determine parameter relationships and the extent of entrainment occurring at the pycnocline within the southern arm of the Great Salt Lake. Dealing with the two-layer stratified system existing within the southern arm--an upper dilute brine layer over a lower dense brine layer--an attempt was made to model interfacial conditions of the southern arm within a laboratory flume. Using characteristic hydrodynamic, kinematic, and geometric parameters of the lake the southern arm of the lake was artificially created in the flume. Through the use of this experimental apparatus a determination was made of the relationships between dimensionless numbers representing upward mixing, relative density difference and the Richardson number. In addition, predictions of the magnitude of the entrainment rate per unit area, k, were established. Visual observations of the interface condition at various velocity steps were also made. Comparison of these results to those made by other entrainment researchers, allowed substantiation of this research. When compared to other salt lake research the flume model consistently predicted larger values of entrainment. It is felt that this research more accurately represented the conditions at the interface of the southern arm, while other researchers made necessary assumptions to expedite the theoretical development of the processes at the interface.

MODELING AND VERIFICATION: THE TWO INDISPENSABLE LEGS FOR PROGRESS TOWARD UNDERSTANDING AND MANAGEMENT OF AQUATIC SYSTEMS AS DEMONSTRATED BY A STUDY OF COASTAL CURRENTS IN LARGE LAKES,
Wisconsin Univ.-Milwaukee. Center for Great Lakes Studies.
C. H. Mortimer.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Karkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 316-338 (Discussion p 339), September 1978. 17 fig, 13 ref. EPA-600/9-78-024.

Descriptors: *Lakes, *Lake Michigan, *Model studies, *Coastal waters, *Currents(Water), *Thermocline dynamics, Computer models, Optimal development plans, Aquatic systems, Remote sensing, Wind velocity, Temperature, Lake Ontario, Basins, Channels, Waves(Water), Risks, Stratification, Physics, Prediction, Kelvin waves, Water intake, Milwaukee(Wis), Meter stations, Offshore depth, Wind direction, Systems analysis, Simulation analysis.

There are two risks associated with computerized mathematical modeling of aquatic systems: (1) limited research funds will not be spent in an optimum interactive balance between model development and field experimentation; and (2) when eventually it becomes apparent that the desired predictive capability has not lived up to expectation, adverse reaction will starve the development of better models. Addressed herein is the avoidance of the first risk, which if successfully accomplished, will diminish the second risk. Our best hope of progress lies in a proper balance between questions directed both to models and to lakes, often in an iterative two-legged sequence in which models assist the planning of optimized schemes of data acquisition. Soundly-conceived and adequately-based 'hard' sets of data, from experiments and lake surveys, are the only means through which models can be used to their full potential. Models are discussed as scientific tools to define the most revealing questions we can ask about lakes. Considered are the physics of large lakes, namely the responses of the stratified basin to wind impulses. Studied are models of thermocline dynamics; with these models, signals from large-basin coastal currents can be heard. The article concludes with some general remarks on lake ecosystem modeling. CONSTRUCTION OF A MODEL OF LAKE BAIKAL ON PRINCIPLES OF SELF-ORGANIZATION,
Akademiya Nauk URSR, Kiev. Inst. Kibernetiki.
A. G. Ibakhnenko.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Karkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 340-369 (Discussion p 370-371), September 1978. 10 fig, 4 tab, 40 ref. EPA-600/9-78-024.

Descriptors: Self-organization, *Model construction, *Lake Baikal(USSR), *Model studies, Algorithms, Equations, Water pollution, Dissolved solids, Suspended solids, Forecasting, Biomass yield, Phytoplankton, Zooplankton, Mixing zones, Systems analysis.

Lake Baikal contains 80% of the freshwater reserve in the USSR and 20% of the world source. Irkutsk University and the Institute of Cybernetics of Ukr. SSR Academy of Sciences have carried out joint research aimed at a better understanding of correlation links between phytoplankton and zooplankton in Lake Baikal. The results of this research are given in Appendix I. The main part of this report reflects the results of a joint investigation carried out by the Novocherkassk Hydrochemical Institute and the Institute of Cybernatics of Ukr. SSR Academy of Science (1973-1975). It is concerned with the construction of three mathematical models of Lake Baikal mixing zones on the basis of self-organization principles. CONCEPTUAL FRAMEWORK FOR COORDINATED GREAT LAKES MONITORING,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
S. V. Rastonis, J. W. Male, and H. E. Allen.
Journal of Great Lakes Research, Vol 4, No 2, p 117-126, June 1978. 2 tab, 30 ref.

Descriptors: *Great Lakes, *Monitoring, *Mathematical models, Sampling, Surveys, Remote sensing, Planning, Pollutants, Water pollution, Sediments, Biology, Fish, Aquatic plants, Chemicals, Methodology, Lakes, Limnology, Model studies.

The utility of conceptual models was discussed as a basis for effective development of coordinated monitoring efforts on the Great Lakes. The use of conceptual models was illustrated in two ways, (1) the development of a methodology for specifying monitoring objectives of the Great Lakes, based on a conceptual model, and (2) the presentation of a comprehensive method for defining resource needs to achieve monitoring objectives. LAKE ERIE IN MID-WINTER,
Canada Centre for Inland Waters, Burlington (Ontario).
N. M. Burns, F. Rosa, and A. Gedeon.
Journal of the Great Lakes Research, Vol 4, No 2, p 134-141, June 1978. 5 fig, 4 tab, 10 ref.

Descriptors: *Lake Erie, *Great Lakes, *Sampling, *Winter, Surveys, Lakes, Temperature, Water temperature, Nutrients, Oxygen, Dissolved oxygen, Phytoplankton, Biomass, Diatoms, Nitrogen compounds, Silica, Phosphorus, Ice, Ice cover, Lake ice, On-site investigations, Limnology.

The results of 4 surveys of Lake Erie during mid-winter were presented. The most recent survey, from February 15 to 17, 1977, was conducted during an exceptionally cold winter to determine whether 6 weeks of complete ice-cover had led to low levels of oxygen concentration in the lake. The results showed that all parts of the lake, even the shallow, normally highly productive areas, contained acceptable levels of oxygen. Apparently, production of oxygen by a small phytoplankton population counter-balanced a fairly low uptake of oxygen and maintained the level of oxygen concentration in most of the water above 90% saturation. The 1976-1977 winter phytoplankton biomass was low (0.1 to 1.0 gm biomass per cu m) and consisted mostly of diatoms. It appears that some of the phytoplankton were photosynthetically active under 70 cm of ice and 23 m of water. All surveys of the lake showed the water to be virtually isothermal at a temperature just above the freezing point of water. The maximum temperature differences observed were about 0.2 deg in magnitude and were found in the East Basin. Nevertheless, the slight temperature differences apparently caused density currents under the ice, which resulted in lowered oxygen concentrations in the deepest part of the East Basin. (Sims-ISWS)

2I. Water In Plants

IF YOU KNOW THE WEATHER YOU CAN PREDICT THE YIELD,
Clemson Univ., SC. Dept. of Horticulture.
J. R. Haun.
Crops and Soils Magazine, Vol. 31, No. 2, p 7-9, November, 1978. 3 fig.

Descriptors: Crop production, Crop response, Climatic data, Weather data, Plant growth.

This paper presents a new concept in the evaluation of plant-environment relations for developing yield prediction systems. This approach involves the daily measurement of plant response in the field under natural, uncontrolled variations in weather conditions. These plant growth data, with associated weather variables, are to be analyzed by computer to develop the yield prediction system. (Skogerboe-Colorado State)

SALT AND WATER STRESS INFLUENCES NITROGEN METABOLISM IN RED KIDNEY BEANS,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
J. N. E. Frota, and T. C. Tucker.
Soil Science Society of American Journal, Vol. 42, No. 5, p 743-746, September-October, 1978. 6 tab, 27 ref.

Descriptors: *Salinity, *Moisture deficit, Nitrogen, Metabolism, Beans, Crop production.

Both salinity and water deficit reduce yields of crop plants. This study was an attempt to provide a better understanding of these stress effects on N metabolism and the utilization of NH4-N and NO3-N. Red kidney bean plants (Phaseolus vulgaris L.) were grown under salt stress (NaCl), water stress (carbowax), and in a normal nutrient solution (control). The 15N in NO3(-), NH4(+), alpha amino acids, total soluble-N and protein-N in plant shoots were analyzed after the plants received 15(NH4)2SO4 and K15NO3 in nutrient solution for 6, 12, 24, and 48 hours. Sodium chloride and carbowax resulted in equal accumulations of NO3-N, NH4(+), and free alpha amino acids in bean shoots. Protein synthesis was significantly reduced in bean shoots when the plants were subjected to NaCl salinity and carbowax, with either source of N, and the inhibition was more severe under salt stress than water stress. (Skogerboe-Colorado State)

ABSORPTION RATES OF AMMONIUM AND NITRATE BY RED KIDNEY BEANS UNDER SALT AND WATER STRESS,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
J. N. E. Frota, and T. C. Tucker.
Soil Science Society of America Journal, Vol. 42, No. 5, p 753-756, September-October, 1978. 2 fig, 5 tab, 21 ref.

Descriptors: *Salinity, *Moisture stress, Absorption, Ammonium salts, Nitrates, Beans, Moisture deficit, Crop production, *Crop response, Nitrogen.

The purpose was to gain additional knowledge regarding the influence of salinity and water deficit on plant uptake of NH4(+) and NO3(-). The absorption patterns of NH4(+) and NO3(-) by red kidney beans (Phaseolus vulgaris L.) were determined under normal conditions (water stress) using an inverse isotope dilution technique with 15N. Salt and water stress inhibited the absorption of both NH4(+) and NO3(-). There was no difference between these two stress treatments in NH4(+) uptake, but carbowax restricted NO3(-) uptake more than did NaCl. Under NaCl salinity the plants absorbed the same amount of N independent of N source; under water stress more NH4(+) than NO3(-) was absorbed. Water absorption was reduced by both stress treatments; N and water uptake were highly correlated. Root permeability decreased in plants subjected to stress. Dry matter production and total N per plant decreased, but the N percentage increased in the stressed plants. (Skogerboe-Colorado State)

BASIC HYDROGEOLOGY - GLACIAL DEPOSITS AS AQUIFERS,
B. Whitehead.
Canadian Water Well, Vol. 5, No. 1, p 34-35, February, 1979. 1 fig.

Descriptors: *Glacial aquifers, *Well yield, Glacial drift, Deposition(Sediments), Hydrogeology, Till, Outwash, Lake sediments.

The classification of glacial deposits is explained in terms of their mode and environment of deposition. Four basic types of glacial deposits are described: till, outwash, lacustrine and marine, and ice-contacted. A typical glacial stratigraphic sequence and the resulting variety of aquifer types are shown in a generalized cross section. The well yields in the various aquifers increases with the thickness, degree of sorting, and grain size of the deposit and the degree of interconnection of the aquifer to recharge sources. DERIVATION OF THE PROBABILITY DENSITY FUNCTION OF CERTAIN BIASED SAMPLES OF COARSE RIVERBED MATERIAL,
Pennsylvania State Univ., University Park. Dept. of Geosciences.
K. W. Potter.
Water Resources Research, Vol. 15, No. 1, p 21-22, February 1979. 1 tab, 5 ref.

Descriptors: *Beds, *Bed load, *Sampling, *Data processing, Analytical techniques, Mathematics, Particle size, Streambeds, Statistics, Probability, Equations, Sediments, Rivers, Riverbed material, Weighting functions.

Several commonly used procedures for sampling coarse riverbed material result in samples that are biased toward the larger particles. Kellerhals and Bray recommend correcting the bias by scaling the sample frequency of each frequency interval by the inverse of the appropriate power of the mean grain size of the interval. If, however, grain size is assumed to be log-normally distributed, it is possible to determine the distribution of the biased sample. This provides explicit bias factors for the sample moments. COASTAL PROCESSES AND MORPHOLOG OF THE BERING SEA COAST OF ALASKA
Geological Survey, Menlo Park, CA.
A. J. Sallenger, Jr., J. R. Dingler, and R. Hunter.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XII Hazards, p 451-502, October 1978. 7 fig, 4 tab, 1 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Geomorphology, *Erosion, *Hazards, *Water pollution, *Structural engineering, Baseline studies, Resources development, Pipelines, Environmental effects, Alaska, *Outer Continental Shelf, *Coastal processes, Bering Sea, Petroleum development.

Storms pose major hazards to coastal developments along the Bering Sea coast of Alaska. During FY76, debris lines that resulted from the November, 1974 storm were found to be nearly 5 m above mean sea level in places along the northern Bering Sea of Alaska. Coastal change is not, however, restricted to storm conditions. Giant cusps were observed to migrate along the coast at 5-6 m/day during the period 6/23/51 - 7/30/51. This migration caused as much as 50 m accretion at a given location over a period of several weeks. One use of this kind of data is to establish a coastal development set-back line. That is, the appropriate government body would prohibit developments within areas subject to inundation by storm surge or undermining by coastal erosion. For structures that must cross the coastline (e.g. pipelines) the maximum scour depth must be established for both storms and over the long-term. The south coast of the Alaska Peninsula has numerous deep embayments which may one day be considered for deep water port facilities. These ports could service offshore petroleum exploitation in both the Bristol Bay area and areas offshore the Pacific coast of the Alaska Peninsula. In order to provide some baseline information, a reconnaissance of the physical coastal environment of Cold Bay and Pavlov Bay was undertaken. The results can be used for preliminary siting studies, qualitative assessment of coastal stability and the long-term directions of transport of particulate pollutants in the littoral system. SHORELINE HISTORY OF CHUKCHI AND BEAUFORT SEAS AS AN AID TO PREDICTING OFFSHORE PERMAFROST CONDITIONS,
Geological Survey, Menlo Park, CA.
D. M. Hopkins, and R. W. Hartz.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XII, Hazards, p 503-573, October 1978. 12 ref, 5 append, map infold. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Hazards, *Geomorphology, *Gravels, *Quarries, *Erosion, Permafrost, Water pollution, Coasts, Baseline studies, Resources development, Environmental effects, Alaska, *Outer Continental Shelf, Petroleum development, Chukchi Sea, Beaufort Sea, Coastal processes.

This report presents detailed data on stratigraphy, lithology, pollen rain, longshore sediment transport, coastal erosion, coastal morphology, and shoreline history. Exploration and production of offshore oil and gas reserves in the Beaufort Sea will require large amount of artificial fill for the construction of causeways, pipelines, artificial islands, and support facilities. Gravel is the primary material used for artificial fill in the arctic, and the location of potential quarry sites is essential to the development and production phases. The environmental impact of quarrying operations can be minimized by locating areas of thick gravel deposits or sites where gravel is now accumulating. Construction of onshore support facilities also requires

knowledge of potential flooding hazards during storm surges and the possible effects of coastal erosion. (Sinha-OEIS)

THE HYDRODYNAMICS AND SEDIMENTOLOGY OF A HIGH (TIDAL AND WAVE) ENERGY EMBAYMENT (SWANSEA BAY, NORTHERN BRISTOL CHANNEL),
University Coll. of Swansea (Wales). Dept. of Geology and Oceanography.
M. Collins, G. Ferentinos, and F. T. Banner.
Estuarine and Coastal Marine Science, Vol. 8, No. 1, p 49-74, January 1979. 14 fig, 1 tab, 47 ref.

Descriptors: *Sediments, *Currents(Water), *Bays, Tidal effects, Tides, Waves(Water), Circulation, Water circulation, On-site data collections, Current meters, Bathymetry, Sampling, Waves(Water), Sedimentation, Hydrodynamics, *Wales, *Swansea Bay(Wales).

Swansea Bay may be taken as an example of an embayment which has a complex and variable hydrodynamic regime resulting from the interaction of its bathymetry and configuration with an adjacent rectilinear, semi-diurnal tidal system and with super-imposed oceanic swell and more locally generated seas. Eulerian tidal current observations in Swansea Bay indicated a coastal tidal current pattern which has developed from the main currents along the northern Bristol Channel. The observed pattern consists of an anticlockwise eddy in the western part of the embayment and a zone of divergence on the eastern side, between the eddy and the main offshore flow. Wave data, as represented by refraction diagrams and the distribution of sea bed orbital velocities, have demonstrated that high energy wave conditions prevail over the area. Sediment distribution and transport in Swansea Bay are controlled by tidally and wave-induced current patterns, but also are related to bathymetry and the exposure of relict deposits. However, evidence was presented to suggest that local dredging activities influence the sedimention processes. (Sims-ISWS)

MODELING ALLUVIAL CHANNEL BED TRANSIENTS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
V. M. Ponce, J. L. Garcia, and D. B. Simons.
Journal of the Hydraulic Division, American Society of Civil Engineers, Vol. 105, No. HY3, Proceedings Paper 14456, p 245-256, March 1979. 6 fig, 10 ref, 2 append.

Descriptors: *Bed load, *Model studies, *Alluvial channels, Beds, Erosion, Aggradation, Fluvial sediments, Numerical analysis, Rivers, Sedimentation, Mathematical models, Sand waves, *Bed load movement, Fluvial hydraulics.

A mathematical model was developed to simulate bed transient formation and propagation in alluvial channels. The mode is of the known-discharge type, i.e., within one time step, the water discharge is considered steady. This technique allows for the implicit numerical modeling of bed transient propagation using longer time steps than would otherwise be possible using the conventional sequential routing method. Instability due to ill-posing of the sediment transport function is circumvented by using a power relation between bed material transport and mean flow velocity. Errors in mass conservation due to linearization at the boundary are eliminated by using a nonlinear formulation of the upstream boundary condition. (Lee-ISWS)

PARTICLE SIZE OF SEDIMENTS COLLECTED FROM THE BED OF THE AMAZON RIVER AND ITS TRIBUTARIES IN MAY AND JUNE 1977,
Geological Survey, Denver, CO. Water Resources Div.
C. F. Nordin, Jr., R. H. Meade, W. F. Curtis, N. J. Bosio, and B. M. Delaney.
Geological Survey open-file report 79-329, 1979. 23 p, 1 fig, 3 tab, 3 ref.

Descriptors: *Bottom sediments, *Rivers, *South America, *Sampling, *Particle size, Analytical techniques, Fluvial sediments, *Bed material, *Amazon River.

One-hundred-eight samples of bed material were collected from the Amazon River and its major tributaries between Belem, Brazil, and Iquitos, Peru. Samples were taken with a standard BM-54 sampler or with pipe dredges from May 18 to June 5, 1977. Most of the samples have median diameters in the size range of fine to medium sand and contain small percentages of fine gravel. Complete size distributions are tabulated. (Woodard-USGS)

TRENDS IN SEDIMENTATION,
Geological Survey, Reston, VA. Water Resources Div.; and Geological Survey, Towson, MD. Water Resources Div.
H. R. Feltz, and W. J. Herb.
In: The Freshwater Potomac: Proceedings of a Symposium in January 1977, College Park, Maryland. Published by the Interstate Commission on the Potomac River Basin, Rockville, Maryland, p 167-171, 1978. 3 fig, 13 ref.

Descriptors: *Sedimentation, *Potomac River, *Sediment transport, *Water quality, *Sediment yield, Bottom sediments, Sampling, Chemical analysis, Trace elements, Heavy metals, Nitrogen, Phosphorus, Pesticides, Polychlorinated biphenyls, Streamflow, Runoff, Storms, Hurricanes, Land use, Sediment control, *District of Columbia, *Maryland, *Potomac River basin, *Anacostia River.

The Potomac River, draining an area of 29,700 square kilometers above tidal influence, is known to have wide fluctuations in water and sediment discharge in rapid response to rainfall. Most of the suspended-sediment load is transported during storms, and loads vary from storm to storm and seasonally. Hurricanes such as Agnes in 1972 can also produce high runoff and sediment discharge. Cropland, construction sites, and stream channels undergoing realinement are major sources of suspended sediment. Available figures indicate that changes in land use over the whole basin were insignificant during 1961-76. About 95 percent of the basin consists of rural, forested, and open-water areas. On the basis of annual values of sediment discharge per unit volume of water discharge, the overall trend in the basin was a decrease in suspended-sediment discharges during the mid- to late 1960's followed by an increase in the early 1970's. The high suspended-sediment discharges associated with Hurricane Agnes in 1972 are partly responsible for this increase. In the mid-1970's the trend reversed, and decreases have reached the levels of the early and mid-1960's. A dramatic decrease in suspended-sediment discharge for the Anacostia River near Colesville, Md., is attributed primarily to an increased use of sediment controls on urban construction sites. Chemical analysis of bottom sediment samples collected throughout the basin show the distribution of heavy metals, nitrogen, phosphorus, and residues of pesticides and polychlorinated biphenyls. Trace quantities to relatively high concentrations were found at several sites. (Woodard-USGS)

UNIT STREAM POWER EQUATIONS FOR TOTAL LOAD,
Corps of Engineers, Chicago, IL. North Central Div.
C. T. Yang.
Journal of Hydrology, Vol. 40, No. 1/2, p 123-138, January 1979. 4 fig, 4 tab, 20 ref.

Descriptors: *Sediment load, *Bed load, *Methodology, *Data collections, *Dunes, *Streamflow, Regression analysis, Dimensional analysis, Sediment transport, Natural streams, *Unit stream power, *Sediment concentration, Incipient motion, Potential energy expenditure.

A dimensionless unit stream power equation for the computation and prediction of total sediment concentration was obtained without using any criterion for incipient motion. This equation was compared with a similar dimensionless unit stream power equation with the inclusion of criteria for incipient motion. Comparisons between the measured results from laboratory flumes and natural rivers and the computed results from these two unit stream power equations indicated that they are equally accurate in predicting the total sediment concentration in the sand size range. For the 1259 sets of data compared, the average computed result from these equations was only 3% higher than the measured result. (Singh-ISWS)

UNIT STEP AND FREQUENCY RESPONSE FUNCTIONS APPLIED TO THE WATERSHED FLUVIAL SYSTEM,

Govind Ballabh Pant Univ. of Agriculture and Technology, Pantnagar (Israel). Dept. of Agricultural Engineering.
T. C. Sharma, and W. T. Dickinson.
Journal of Hydrology, Vol 40, No 3/4, p 323-335, February 1979. 3 fig, 3 tab, 8 ref.

Descriptors: *Sediments, *Sediment yield, *Model studies, Mathematical models, Equations, Watersheds(Basins), Runoff, Erosion, Sediment transport, Streams, Rivers, Sedimentation, Sedimentology.

Unit step response and frequency response functions were shown to provide useful information to model and understand the watershed runoff-sediment yield process. One of the applications of the unit step response was to rank watersheds for their sediment production potentials. The frequency response function was used to indicate the memory content of the watershed runoff-sediment yield system. (Sims-ISWS)

DISTRIBUTION OF SUSPENDED SEDIMENTS IN THE SHALLOWS OF RESERVOIRS AND POSSIBILITY OF ESTIMATING THEM BY THE INTEGRATION METHOD,
V. M. Klaven.
Soviet Hydrology: Selected Papers, Vol. 16, No. 2, p 113-119, 1977. 4 fig, 3 tab, 10 ref. Translated from Trudy Gosudarstvennogo Gidrologicheskogo Instituta, No. 242, p 115-128, 1977.

Descriptors: *Sediments, *Suspended solids, *Reservoirs, *Shallow water, Sampling, Data processing, Waves(Water), Currents(Water), Sediment transport, Analytical techniques, Distribution patterns, Suspended particle concentrations.

The distribution of suspended-particle concentration in the shallows of bodies of water must be taken into account to solve engineering problems (planning water intakes, ships' channels, harbors, thermal electric power stations) and to improve methods for measuring and computing suspended-particle concentration. The following conclusions can be drawn from the analysis of measurements of suspended sediment transport in the shallows of the Kayrak-Kum, Kakhovka, and Kremenchug reservoirs, made in a broad range of variation of wave heights, velocities of longshore currents, rock composition of the shallows, and suspended-particle concentrations in the water: (1) The time-averaged suspended-particle concentrations on verticals in the surf zone increase approximately exponentially from the water surface to the bottom, and the nature of their distribution does not vary noticeably with a change in the rock composition of the shallows from fine- to medium-grained sand with admixtures of various amounts of silt particles. (2) The distribution of the suspended-particle concentration in the water (rho) and of elementary suspended-sediment transport (r) over the width of the surf zone is most frequently of two types: a distribution with a single maximum in the water-edge zone with rho and r values decreasing gradually toward the edge of the shallows; and a distribution with two maxima, one in the water-edge zone and the other in the zone of the outer-line of breakers, usually confined to the central part or the edge of the shallows. SEDIMENT YIELDS FROM SMALL FORESTED CATCHMENTS NORTH WESTLAND-NELSON, NEW ZEALAND,
Forest Research Inst., Christchurch (New Zealand). Protection Forestry Div.
C. L. O'Loughlin, L. K. Rowe, and A. J. Pearce.
Journal of Hydrology (New Zealand), Vol 17, No 1, p 1-15, 1978. 8 fig, 5 tab, 21 ref.

Descriptors: *Sediment yield, *Sediment transport, *Forest watersheds, *Sediments, Gravels, Sands, Forests, Drainage, Storms, Runoff, Storm runoff, Discharge(Water), Flow, Hydrographs, Sedimentation, Erosion, Sedimentology, *New Zealand.

Sediment yield rates from 6 small forest catchments in North Westland and from 4 small forest catchments in Nelson averaged 55 cu m/sq km p.a. and 5 cu m/sq km p.a., respectively. A total of 55% of sediment yield was produced from the North Westland catchments over 821 days during one large storm event with a return period of approximately 20 years. In the Nelson catchments, 90% of the sediment yield over 608 days occurred during a single storm event with a return period of 6 months to one year. It was hypothesized that the development of the forested gravel hill country landscapes in North Westland and Nelson have depended closely on infrequent high intensity storms which occur perhaps once every 10 years or less frequently. STATISTICAL ANALYSIS OF SEDIMENT MOTIONS OF DUNES,
Stone and Webster Engineering Corp., Boston, MA.
C. S. Hung, and H. W. Shen.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 105, No HY3, Proceedings Paper 14438, p 213-227, March 1979. 18 fig, 5 tab, 13 ref, 1 append.

Descriptors: *Bed load, *Colorado, *Channels, *Dunes, Rivers, Sedimentation, Cesium, Sedimentation rates, Statistical methods, Hydraulics, Sediment transport, Alluvial channels, *Statistical analysis, Alluvial bed forms, Cesium 137.

Statistical analyses were done on the movements of bed load particles over alluvial bed forms from data collected in a large laboratory flume at Colorado State University. The bed load particles were tagged by radioactive tracer--Cesium 137. Statistical properties of the random variables and the correlations between these variables were investigated. It was found that within the test range, the mean and variance of longitudinal step length, the mean wavelength and the mean wave height of bed forms, the particle speed, the variance of vertical step length, and the variance of lateral step length all increase with the increase of flow. However, the coefficients of variation for both wave height and wavelength remain approximately the same for all flow conditions tested. The ratio of average wave length to average wave height decreases with the increase of flow. (Lee-ISWS)

SEA-FLOOR INSTABILITY OF CONTINENTAL SHELF OFFSHORE CENTRAL AND NORTHERN CALIFORNIA,
BBN-Geomarine Services Co., Oxnard, CA.
A. Mahmood, and R. Son.
In: 'Recommendations for Baseline Research in Central and Northern California Relative to Offshore Resource Development', Proceedings of Conference/Workshop held in San Francisco, CA, October 22-24, 1976, p 99-105, January 1977. 4 fig, 1 ref.

Descriptors: *Stability, *Continental shelf, *Geology, Water quality, Sedimentation, Resources development, Hazards, *Outer Continental Shelf, Sea floor, Northern California, Central California.

The continental shelf along central and northern California coast is very narrow as compared to other coastal areas of United States. The narrow shelf width may force offshore exploration in some steep areas. The potential for sea-floor instability needs to be evaluated as it would influence offshore resource development facilities. From available data a sketchy assessment of slope instability potential can be made. A figure shows areas of moderate and steep slopes along the central and northern California coast. The areas are within the 600 feet water depth. In addition to slope steepness and nature of sediments, data on evidence of past or present instability can be gathered by identifying slumps, scarps, and other landslide topography features on high-resolution data. CATION-EXCHANGE CAPACITY OF CLAY-RICH SOILS IN RELATION TO ORGANIC MATTER, MINERAL COMPOSITION, AND SURFACE AREA,
Department of Agriculture, Sainte-Foy (Quebec).
Y. A. Martel, C. R. De Kimpe, and M. R. Laverdiere.
Soil Science Society of America Journal, Vol. 42, No. 5, p 764-767, September-October, 1978. 1 fig, 7 tab, 16 ref.

Descriptors: *Cation exchange, Clay minerals, *Organic matter, Mineralogy, Soil horizons, *Regression analysis, Soil texture.

Regression analyses were used to correlate organic matter, texture and surface area values to the cation-exchange capactiy (CEC) of clay-rich soils in the lowlands of Quebec. The Ap, Bg and Cg

horizons of 11 Gleysolic soils (Aqu-Suborders) were analyzed for CEC, exchangeable bases and acidity, total and fine clay contents, organic matter, surface area and mineralogical composition. The soils contained illite, chlorite, smectite, and vermiculite in addition to quartz and feldspars. In the Ap horizon, total clay and fine clay contents were better related to CEC than organic matter and surface area. In the Bg and Cg horizons, surface area gave the best correlation with CEC. As calculated by multiple regression equations, CEC values of organic matter increased with depth from 56.5 to 223 meq/100 g, while CEC values of total clay decreased from 37.7 to 22.5 meq/100 g and that of fine clay decreased from 57.5 to 50.7 meq/100 g. Variations in the mineralogical composition, although small, were sufficient to explain nearly 50% of the variations in the CEC. (Skogerboe-Colorado State)

ADSORPTION AND EXTRACTABILITY OF MOLYBDENUM IN RELATION TO SOME CHEMICAL PROPERTIES SOIL,
Pahlavi Univ., Shiraz (Iran). Dept. of Soil Science.
N. Karimian, and F. R. Cox.
Soil Science Society of America Journal, Vol. 42, No. 5, p 757-761, September-October, 1978. 3 fig, 4 tab, 32 ref.

Descriptors: *Molybdenum, *Adsorption, *Soil chemistry, Soil tests, Iron oxides, Organic matter, Hydrogen ion concentration, Phosphorus.

Adsorption of Mo from aqueous solutions was determined for eight soils from the Atlantic Coastal Plain and Piedmont regions. The data followed the Feundlich isotherm more consistently than the Langmuir. Adsorption increased as the organic matter and/or Fe oxide contents of the soils increased. Adsorption from an aqueous solution that was initially 0.3 mM Mo (AdMo) also was determined on 32 soils collected from the regions. The AdMo level was positively correlated with Fe oxide and organic matter contents and negatively correlated with pH and P levels. The level of Mo extracted with acid ammonium oxalate (Grigg Mo) and an anion exchange resin (resin Mo) were also determined and related to soil chemical properties and a lime treatment. Grigg Mo was positively correlated with amorphous and free fe oxide by oxalate. Resin Mo was positively correlated with pH but not with other soil properties. Incubating soils with CaCO3 increased the level of rsin Mo. (Skogerboe-Colorado State)

VARIATIONS IN THE ACID CONTENT OF RAIN WATER IN THE COURSE OF A SINGLE PRECIPITATION,
Arizona Univ., Tucson. Dept. of Chemistry.
M. D. Seymour, S. A. Schubert, J. W. Clayton, Jr., and Q. Fernando.
Water, Air, and Soil Pollution, Vol 10, No 2, p 147-161, August 1978. 5 fig, 2 tab, 18 ref.

Descriptors: *Rain water, *Acids, *Rainfall, Sampling, Chemical analysis, Analytical techniques, Chemicals, Acidic water, Hydrogen ion concentration, Volumetric analysis, Precipitation(Analysis), Data processing, Pollutants, Water pollution, Water pollution sources, Pollutant identification, Chemistry of precipitation.

The major acid components in the rainwater collected during 5 different rainfall events in July and August 1977 were found to be a strong acid, the weak acid NH4(+), and dissolved CO2 from the atmosphere. Variations in their concentrations were determined as a function of time in the course of each of the rainfall events. Two experimental methods were used in this investigation, a microtitrimetric method and a coulometric method. The data were analyzed by the use of modified Gran functions. Both methods gave the same results. The most significant observation was that the strong acid concentration increased from very low values to a maximum and then decreased in the course of a single rainfall event. (Sims-ISWS)

OCEANIC AND ATMOSPHERIC VELOCITY FIELDS AND WATER CHEMISTRY,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
D. Halpern.
In: 'Recommendations for Baseline Research in Central and Northern California Relative to Offshore Resource Development', Proceedings of Conference/Workshop held in San Francisco, CA, October 22-24, 1976, p 91-97, Jan 1977. 3 fig, 7 ref.

Descriptors: *Baseline studies, *Oceanography, *Meteorology, *Water composition, Chemistry, Resources development, Environmental effects, Path of pollutants, *Outer Continental Shelf, Northern California, Central California, Velocity fields.

Knowledge of the physical environment is an integral part of environmental baseline studies. The trajectory of oil introduced at the surface is determined to a large extent by the space and time variations of the wind and current fields. Accurate interpretation of biological and chemical measurements is dependent upon knowledge of the physical environment. The purpose of this presentation is to describe the richness of the space and time scales of the oceanic and atmospheric velocity fields and water chemistry to be expected in the outer continental region of central and northern California. Because of the scarcity of state-of-the-art physical oceanographic observations within this region, examples are illustrated with data obtained elsewhere. (See also W79-06464) (Sinha-OEIS)

THE DISTRIBUTION OF ORGANIC MATERIAL AND TRACE METALS IN SEDIMENTS FROM THE RIVER LIFFEY ESTUARY, DUBLIN,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
G. B. Jones, and M. B. Jordan.
Estuarine and Coastal Marine Science, Vol 8, No 1, p 37-47, January 1979. 4 fig, 1 tab, 30 ref.

Descriptors: *Estuaries, *Sediments, *Metals, *Organic matter, Sampling, Data processing, Chemical analysis, Carbon, Nitrogen, Humic acids, Fibers(Plants), Lignins, On-site data collections, Hydrography, Water circulation, Rivers, Sedimentation, *Ireland, *River Liffey Estuary(Ireland).

Sediments of the River Liffey Estuary have been analyzed for organic carbon, Kjeldahl nitrogen, humic acid, and crude fibre contents. Several trace metals also were analyzed. The hydrographic conditions which control the transport of this material also were studied over a tidal cycle. Results indicated that the upper reaches of the estuary are isolated from the incoming seawater and that trace metal enrichment is localized. This metal enrichment is accompanied by an increase in the organic carbon, nitrogen, and humic acid levels. (Sims-ISWS)

ORGANIC MATTER IN SURFICIAL SEDIMENTS OF THE MIRAMICHI ESTUARY, NEW BRUNSWICK, CANADA,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Environmental Marine Geology.
M. A. Rashid, and G. E. Reinson.
Estuarine and Coastal Marine Science, Vol 8, No 1, p 23-36, January 1979. 9 fig, 3 tab, 26 ref.

Descriptors: *Organic matter, *Sediments, *Estuaries, On-site investigations, On-site data collections, Circulation, Water circulation, Rivers, Coasts, Carbon, Nitrogen, Particle size, Sampling, Pollutants, Water pollution, Water pollution sources, Sedimentation, *New Brunswick(Canada), *Miramichi Estuary(New Brunswick).

The surficial sediments of the Miramichi estuary, New Brunswick, contain a much higher quantity of organic matter than would be expected to occur in an estuary of this type, shallow and well-mixed. The organic carbon distribution, in general, corresponds with the distribution of fine-grained sediment, although higher concentrations occur in sediments of the drowned river channel than in sediments of the bay portion of the estuary. The high quantity of organics in all the sediments and differences in concentrations between river channel and bay sediments are the direct result of the discharge of pulp-mill effluent into the upper reaches of the estuary. The organic carbon isotopic composition of sediments suggest that land-derived material is the predominant source of organics throughout the estuary. Marine organic material is restricted to the sediments near the estuarine mouth. Dispersal of the organic matter is achieved largely by transport in the upper freshwater effluent layer and by settling through the water column when transport energies are reduced. Settling of organic-matter is highest in areas where deposition of fine-grained inorganics prevails. (Sims-ISWS)

TRITIUM AND CARBON-14 DISTRIBUTIONS IN SEAWATER FROM UNDER THE ROSS ICE SHELF PROJECT ICE HOLE,
Scripps Institution of Oceanography, La Jolla, CA.
R. L. Michel, T. W. Linick, and P. M. Williams.
Science, Vol 203, No 4379, p 445-446, February 2, 1979. 2 tab, 15 ref. NSF DPP76-22134, DPP77-20579, OCE77-17567, EAR76-22623.

Descriptors: *Tritium, *Carbon radioisotopes, *Sea water, *Antarctic, Ice, Cold regions, Isotope studies, Pollutants, Pollutant identification, Circulation, Water circulation, Oceans, Oceanography, *Ross Ice Shelf, *Ross Sea.

The tritium and carbon-14 activities of seawater samples collected from 22 to 200 meters below the ice at the Ross Ice Shelf Project ice hole were reported. The tritium results showed that the waters below the ice have exchanged with Ross Sea water since the advent of nuclear testing. The carbon-14 results indicated that waters in the upper layer exchange in time periods of less than 6 years. Measurements of these isotopes in seawater under the Ross Ice Shelf in McMurdo Sound showed that this water has a different history. (Sims-ISWS)

OCEAN TIDE AND WAVES BENEATH THE ROSS ICE SHELF,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Geological Sciences.
R. T. Williams, and E. S. Robinson.
Science, Vol. 203, No. 4379, p 443-445, February 2, 1979. 2 fig, 1 tab, 12 ref. NSF GV-40434, DPP73-05873.

Descriptors: *Tides, *Waves(Water), *Antarctic, Ice, Ocean waves, Tidal waters, On-site investigations, On-site data collections, Data processing, Oceans, Oceanography, *Ross Ice Shelf, *Ross Sea.

The ocean tide in the southern Ross Sea is principally diurnal. The trophic tide range (double amplitude) is between 1 and 2 meters, depending on the location, and is closely related to the local water-layer thickness. The range of the tropic tide is more than 3 times the range of the equatorial tide. Cotidal and coamplitude charts were made for the largest diurnal constituents, K sub 1 and O sub 1, and a provisional cotidal map was made for the semidiurnal constituent M sub 2. The amplitudes of the diurnal tide constituents are larger in the Ross Sea than in the adjacent southern Pacific Ocean, indicating the existence of a diurnal resonance related to the shape and depth of the sea. Waves related to ocean swell propagate into the ice-covered region from the northern Ross Sea. These waves have amplitudes near 1 centimeter, and periods in the range 1 to 15 minutes. The speed at which these waves travel is successfully predicted by flexural wave theory. (Sims-ISWS)

Descriptors: *Water circulation, *Melting, *Water temperature, *Salinity, *Antarctic, Cold regions, Temperature, Circulation, Density, Ice, On-site data collections, Data processing, Oceans, Measurement, Oceanography, *Ross Ice Shelf.

Thermohaline observations in the water column beneath the Ross Ice Shelf and along its terminal face show significant vertical stratification, active horizontal circulation, and net melting at the ice shelf base. Heat is supplied by seawater that moves southward beneath the ice shelf from a central warm core and from a western region of high salinity. The near-freezing Ice Shelf Water produced flows northward into the Ross Sea. (Sims-ISWS)

MECHANISM AND PREVENTION OF REVERSE OSMOSIS MEMBRANE FOULING,
Midwest Research Inst., Minnetonka, MN. North Star Div
J. E. Cadotte, and R. J. Peterson.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A053 630, Price codes: A02 in paper copy, A01 in microfiche. September 30, 1977. 3 p. DAAG29-76-C-0053.

Descriptors: *Reverse osmosis, *Desalination, *Desalination processes, *Membrane fouling, *Desalination apparatus, *Membrane processes, *Pollutants, Colloids, Pollutant identification, Flocculation, Filtration, Clays, Chlorine, Organic compounds, Inorganic compounds, Water treatment, Water purification.

Information concerning the deposits which foul reverse osmosis membranes is abstracted from two unpublished papers. Testing revealed that colloidal and dissolved constituents of naturally occurring surface waters were the cause of membrane fouling. Although clays and inorganic colloids are easily removed from feedstreams by polymeric flocculation and sand filtration the organic colloids are more difficult to remove. The surface analysis techniques, electron spectroscopy, Auge electron spectroscopy, and scanning electron microscopy, were used to characterize membrane deposit from Potomac River water and sea water feeds. The three approaches selected to reduce membrane fouling were: (1) improvement in pretreating the feedwater; (2) complexing the organic colloids with the addition of cationic polymers to the feed water; and (3) modification of the membrane surface to decrease the adherence of the foulants. Effort was concentrated on the first method. The pretreatment process involves the addition of an organic polymer flocculating agent followed by sand filtration. Alum and ferric chloride, coagulating agents, were used in conjunction with organic polymer flocculants; ferric chloride appeared better for removing organic colloids from river water. A pretreatment process for river water was developed in which the raw water was pretreated with 10 ppm of chlorine and 10 to 50 ppm of chlorine and 10 to 50 ppm ferric chloride. The pH of the water was adjusted to 5.5 with sulfamic acid which complexed the chlorine so that it did not oxidize the membrane. (Davison-IPA)

RESEARCH ON AND DEVELOPMENT OF ION-SELECTIVE AND ION-SPECIFIC MEMBRANES FOR USE IN THE LARGE-SCALE, LOW-COST DEMINERALIZATION OF SALINE WATERS BY SELECTIVE ELECTRODIALYSIS.
Polytechnic Inst. of New York, Brooklyn.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-161 694, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 37, May 1960. 77 p, 6 fig, 11 tab, 35 ref. 14-01-001-62.

Descriptors: *Desalination, *Desalination apparatus, *Membranes, *Membrane processes, Permeability, Fabrication, Ion transport, Specific retention, Laboratory tests, Selectivity, Diffusion, Sulfates, Ions, Chlorides, Distillation, Electrodialysis, Separation techniques, Water treatment, Desalination processes, Water purification, Saline water, Brackish water.

An investigation of known membrane systems which might be more permeable to sulfate than to chloride, and the attempt to prepare membranes of improved specificity are reported. A membrane of improved specificity would be useful in removing sulfate from a chloride-sulfate solution in which the sulfate content is too high, or to fractionate a mixture of the ions into two solutions with each solution containing only one ion. The commercial membranes, Nalfilm 2 and Nalfilm 4 were investigated. Compounds presumed to be specific to sulfate were utilized in the preparation of membranes with improved specificity. Impregnated membranes made from o-phenylene-diamine and benzidine and polymerized on Polypor PVA formaldehyde were tested along with four hetrogeneous membranes prepared with anion exchange resins in a Dynel matrix. The tests to determine specificity included measurements of the bi-ionic potentials, conductance, selectivity ratios, diffusion coefficients, and direct measurement of the transport numbers in brackish water. The resulting data is tabulated. Although the tests indicated that membranes can be prepared from material specific to sulfate, the membranes showed no transport specificity. The technique of preparing a sulfate specific membrane by incorporating Benzidine-Formaldehyde in an inert matrix was insufficient because the resin bound the sulfate too strongly. (Davison-IPA)

DEVELOPMENT OF THE ZONE-PURIFICATION PROCESS FOR PREPARING POTABLE WATER FROM SEA WATER,
Battelle Memorial Inst., Columbus, OH.
W. H. Mink, G. F. Sachsel, and R. B. Filbert, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-161 766, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 39, June 1, 1960. 30 p, 10 fig, 2 tab, 4 append. 14-01-001-175.

Descriptors: *Desalination, *Desalination processes, *Desalination apparatus, *Zone-purification process, *Freezing, Economics, Estimated costs, Computer models, Sea water, Potable water, Analog models, Water purification, Water treatment, Separation techniques, Tubes, Refrigeration, Temperature control.

The vertical-tube zone-void refiner was selected as the apparatus in which the zone-purification process could operate in a continuous manner. In this unit a number of vertical tubes pass through closely spaced, horizontal plates. With the spaces between the plates connected by automatic values to either the heating or cooling part of a refrigeration system, it is possible for any space to be a melting or freezing zone. The freezing and melting zones move upward along the tube by selective operation of the valves. As the sea water introduced near the top of the tube passes down the tube, it is subjected to a zone purification as it passes a freezing zone. Purified water leaves the bottom of the tube, and salt is concentrated as brine at the top to be periodically removed by flushing with fresh sea water. Information obtained from an analog computer simulation of the unit and additional experimental freezing data show that the optimum vertical-tube would require four stages, freeze 13% of the feed, and require a temperature difference in the freezing zones of 3F. The estimated capital costs for plant producing 100,000 gallons of potable water/day were $2,600,000, with operating costs estimated at $9.60/1000 gallons of potable water. Capital and operating costs for a 10 million gpd plant were estimated at $115,000,000 and $4.21/1000 gallons, respectively. It is concluded that these costs are not likely to be reduced with major changes in the process. (Davison-IPA)
W79-06083

DEVELOPMENT, CONSTRUCTION, AND TESTING OF OSMIONIC DEMINERALIZERS,
Southern Research Inst., Birmingham, AL.
R. E. Lacey, E. W. Lang, and C. E. Feazel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-161 862, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 38, June 1960. 94 p, 26 fig, 11 tab, 8 ref. 14-01-001-88.

Descriptors: *Desalination, *Desalination processes, *Desalination apparatus, *Osmionic demineralizers, Testing, Laboratory tests, Equations, Membranes, Membrane processes, Physical properties, Physicochemical properties, Materials, Demineralization, Cost comparisons, Estimates costs, Separation techniques, Water treatment, Water purification, Brackish water.

Two bench-scale demineralizers based on the osmionic process were developed to determine whether these units could be built by methods amenable to mass production, and whether the demineralization rates obtainable in such units are rapid enough to be of practical interest. In Part A the important results of the project are summarized

and the current status of the osmionic process is reported. In Part B the work is discussed in detail. Alterations in the original Murphy Design equations are discussed and the electrochemical and physical properties of osmionic membranes are examined. The following special testing programs important to the design of osmionic units are discussed: (1) testing of bonds between membranes; (2) polarization or boundary-layer effect; (3) pressure drop and solution distribution within membrane compartments; (4) evaluation of gasket materials for the second bench-scale demineralizer; and (5) leakage of ions through membranes. Details of both bench-scale demineralizers are given. The estimated costs of demineralization based on the osmionic process appear to be competitive with those of other processes. (Davison-IPA)

EVALUATION OF THE ZONE-PURIFICATION PROCESS AS A METHOD OF PREPARATION OF POTABLE WATER FROM SEA WATER,
Battelle Memorial Inst., Columbus, OH.
R. C. Himes, S. E. Miller, W. H. Mink, and H. L. Goering.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-161 818, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 36, May 1960. 32 p, 8 fig, 5 tab. 14-01-0001-80.

Descriptors: *Desalination, *Desalination processes, *Zone-purification process, *Freezing, *Ice-water interfaces, Interfaces, Crystal growth, Crystallization, Demineralization, Equipment, Mechanical equipment, Saline water, Potable water, Evaluation, Separation techniques, Water purification, Water treatment.

Continuing work is reported in understanding the phenomena which occur during freezing to establish optimum conditions for segregation of salt and to determine the most suitable conditions for large scale utilization of the zone purification process. Studies on water-ice interface shape were concentrated on the investigation of mechanical stirrers and a continuous flow-type apparatus for providing fluid measurement near the interface. These studies have shown that the shape of the interface is important in determining the nature of the ice deposited. High segregation efficiency was obtainable by promoting the growth of ice crystals from the center of the freezing tube toward the periphery in place of the normal growth which is inward from the periphery. Experimental details are given for studies on interface shape, rate of crystallization of ice from salt solutions, microscopic examination of pulled ingots, constitutional super cooling, multiple-stage freezing, efficiencies of segregation in multiple-stage freezing and crystal-pulling experiments. Preliminary engineering evaluation and detailed engineering treatment are discussed. It is concluded that periodic salt entrapments are linked with breakdown of constitutional supercooling. The technical feasibility of multiple-stage zone-freezing conversion of sea water was demonstrated, and perhaps the vertical tube system of the several multiple-stage continuous freezing systems evaluated may be economically feasible. (Davison-IPA)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-161 403, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 32, July 1959. 78 p, 15 fig, 7 tab, 8 append. 14-01-001-86.

Descriptors: *Desalination, *Desalination processes, *Freezing, Laboratory tests, Equipment, Costs, Capital costs, Operating costs, Water costs, Separation techniques, Desalination apparatus, Design criteria, Water treatment, Water purity.

An experimental program is reported wherein the operational variables of a direct freezer and wash separation column are determined for the purpose of designing a pilot plant. Recent modifications to the experimental equipment resulted in an increased capacity of about 400 gpd with an acceptable amount of wasted wash water. Project activity is reported for September 1 to November 30, 1958 and activity for period October 15, 1957 to November 30, 1958 is summarized. Experimental freezing and separation results are presented. A pilot plant using an absorption refrigeration machine for water vapor removal was designed to produce 15,000 gpd of fresh water from sea water. Total estimated costs for fabrication, assembly and leak testing is $150,000. Estimated capital costs are presented for single effect plants with capacities of 15,000 gpd, 100,000 gpd, 500,000 gpd, and 10,000,000 gpd. The cost of water produced by these plants was estimated to be economical with steam available at $.25 or less/MBtu and $.55/MBtu, or electrical power available at $.007/kwhr. The single effect absorption machine is expected to produce less expensive water than the three effect machine if waste steam cost is less than $.15/MBtu. (Davison-IPA)

THIN FILM VAPOR COMPRESSION SALINE WATER CONVERSION SYSTEM,
Westinghouse Research and Development Center, Pittsburgh, PA.
A. Willenbrock, Jr., R. M. Chamberlin, D. R. Fraser, G. E. McGinnis, and J. A. Cyphers.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 582, Price codes: A15 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 85, February 1964. 323 p, 104 fig, 13 tab, 17 ref, 5 append. 14-01-0001-273.

Descriptors: *Desalination, *Desalination processes, *Desalination plants, *Thin film vapor compression, Evaporation, Thin films, Heat transfer, Technology, Economics, Cost comparisons, Materials, Separation techniques, Water treatment, Water purification, Saline water.

A research and development program is reported wherein the critical areas of a proposed thin film vapor compression system were examined and evaluated. The five tasks involved in the program included: (1) determining the characteristics of an adequate saline water evaporating film flowing on a vertical or nearly vertical flat surface; (2) developing the technology to create and maintain this film; (3) determining of minimum cost materials consistant with environment, life and manufacturing requirements; (4) developing improvements in heat transfer by specially formed surfaces; and (5) evaluating the manufacturing techniques in fabricating the heat transfer surface. The technical assumptions were verified experimentally; the required developments were accomplished; the economic assumptions were studied and reevaluated; and the technology was attained to design a pilot plant. It is concluded that a one million gpd thin film vapor compression sea water conversion system could be built which would produce water at comparable costs of current multi-stage flash plants. (Davison-IPA)

CONTINUATION OF MATERIALS EVALUATION PROGRAM,
Rice (Cyrus William) and Co., Pittsburgh, PA.
H. C. Bramer, W. E. Bell, R. E. Moore, D. R. Surdock, and D. R. Brenneman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-201 020, Price codes: A13 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 535, March 1970. 283 p, 34 fig, 32 tab, 14 ref, 1 append. 14-01-0001-1657.

Descriptors: *Desalination, *Materials Evaluation Report Form, *Desalination apparatus, *Materials testing, *Evaluation, *Information retrieval, Corrosion, Tubes, Steel pipes, Linings, Coatings, Plastic, Rubber, Laboratory tests, Water treatment, Separation techniques, Desalination plants.

The on-going testing of construction materials and equipment at test bed plants and other facilities operated by the Office of Saline Water Research is reported. In response to the need for a centralized and coordinated program for reporting corrosion information, the Materials Evaluation Report Form (MERF) was developed. This complete information handling and retrieval system for the information generated during field inspections, from nondestructive testing, from corrosion testing in the laboratory, from laboratory analyses, and other sources is described. Details of testing in the following areas are given: tubing materials in all test bed plants, corrosion specimens in side stream loops, corrosion deposition as a function of dissolved oxygen, and carbon steel erosion-corrosion. Selected tubing materials in all test bed plants were tested using the Probolog Instrument. In high maintenance areas requiring frequent repair and replacement carbon steel piping the use of fiberglass reinforced plastic piping and plastic lined light gauge steel or aluminum piping seems economically justified. Recommendations are made for further research in these areas and the area of waterside technology as related to saline water conversion equipment performance. (Davison-IPA)

FABRICATION OF SMOOTH TUBES FOR LARGE MULTISTAGE FLASH EVAPORATOR DESALINATION PLANTS,
Oak Ridge National Lab., TN.
F. J. Moran.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-201 024, Price codes: A09 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 540, March 1970. 176 p, 25 fig, 7 tab, 3 ref, 6 append. 14-01-0001-534.

Descriptors: *Desalination apparatus, *Tubes, *Fabrication, *Industrial production, *Copper alloys, Desalination processes, Multiple-stage flash evaporation, Titanium, Water treatment, Water purification, Separation techniques, Desalination.

A study with the following objectives is presented: (1) to ascertain the present state of the art of fabricating copper-nickel and titanium alloy condenser tubing and (2) to stimulate industry development of improved methods. The scope involved performing a continuous evaluation of the state of the art; developing specifications for fabricating reliable low-cost tubing; evaluating improved methods for fabricating seamless and welded tubes; and surveying eddy-current and ultrasonic types of tube testing instruments, and determining their suitability for high-speed, in-line testing of smooth tubes for desalination plants. The state of the art has remained static because the market for condenser tubes has not been large enough to justify the capital investment needed to produce copper-alloy tubes by the most advanced methods, and because the relatively short lengths required in heat exchanges could be produced on conventional draw benches keeping the more efficient production units occupied with supplying the growing demand for unalloyed copper tubing. The production methods, limitations and costs of copper-alloy tube production are summarized. The development of improved production of copper-nickel tubes, and its estimated costs are discussed. Welded tube fabrication, quality control, specifications for copper-nickel tubing for multi-stage flash (MSF) plants, splicing of tubes for use in MSF plants, improved production processes for titanium tubes, and welding of titanium tubes to titanium-clad steel tube sheets are examined. AN INVESTIGATION OF THE TRANSPORT PROPERTIES OF ION EXCHANGE MEMBRANES,
Little (Arthur D.) Inc., Cambridge, MA.
J. H. B. George.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-179 945, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 159, December 1965. 36 p, 2 fig, 13 tab, 10 ref. 14-01-0001-372.

Descriptors: *Desalination, *Membrane processes, *Cation exchange, *Conduction, Conductivity, Transfer, Water conveyance, Activation energy, Measurment, Temperature, Aqueous solutions, Testing, Testing procedures, Water treatment, Water purification, Separation techniques.

Experimental data on the specific conductance of a polystyrene-sulfonate cation exchange membranes and water transfer accompanying the passage of ions through the membrane are presented. The conductance measurements were carried out at 10, 25, and 40C; equivalent conductances and energies of activation were calculated for the conduction process. It was found that equivalent conductances of ions in the membranes are lower than the corresponding values in free aqueous solution; the effect is much greater for multivalent ions. Water transfer measurements were made under conditions corresponding to those used for conductance measurements. Although water transfer/equivalent varied correspondingly with charge type, the water transfer/mole of ion showed similar values for all ions studied, except the heavily hydrated lithium ion which showed larger values. Water transfer, independent of temperature for monovalent ions, decreased with temperature for divalent and trivalent ions. The data were combined with estimated values for ionic self-diffusion coefficients in the membrane to calculate friction coefficients for the interactions between membrane, counterion, and water. The usefulness of the numerical values is limited by assumptions which must be made in the derivation. (Davison-IPA)

REVERSE OSMOSIS MEMBRANE RESEARCH,
General Atomic Co., San Diego, CA.
V. Merten, H. K. Lonsdale, R. L. Riley, and K. D. Vos.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-180 322, Price codes: A09 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 265, August 1967. 197 p, 54 fig, 44 tab, 76 ref, 1 append. 14-01-001-767.

Descriptors: *Desalination, *Desalination apparatus, *Reverse osmosis, *Membranes, *Membrane processes, Thin films, Semipermeable membranes, Compaction, Cellulose acetate, Polymers, Ion transport, Water purification, Water treatment, Separation techniques, Brackish water, Plastics, Saline water.

Several areas of research on the properties and performance of cellulose acetate membranes in reverse osmosis desalination, and the development and evaluation of improved membranes are summarized. The two significant limitations of the use of modified cellulose acetate membranes, membrane compaction and lifetime, were studied. The study of the decline in water flux with time indicates that flux decline probably results from morphological changes in membrane substructure. Membrane life studies conducted on simulated brackish water and on San Diego tap water allow predictions of membrane life to be tested based on previous studies of the pH-dependence of the hydrolysis rate of cellulose acetate. In studies of the thin-film method for preparing high-flux cellulose acetate membranes, two membranes produced with no imperfections exhibited 99.8% sodium chloride rejection. Attention was concentrated on the interpolymer of ethyl cellulose and polyacrylic acid and ion exchange membranes in the study of alternate membrane materials. The study of models of transport phenomena in membranes includes coupled flow in solution-diffusion membranes and the finely-porous, fixed-charge membrane. Immersion, direct osmosis, and reverse osmosis experiments show that phenol and water are strongly coupled in flowing through cellulose acetate membranes. Negative rejection of phenol was observed in reverse osmosis. (Davison-IPA)

DISPOSAL OF THE EFFLUENTS FROM DESALINATION PLANTS: THE EFFECTS OF COPPER CONTENT, HEAT AND SALINITY,
Dow Chemical Co., Midland, MI.
M. A. Zeitoun, E. F. Mandelli, W. F. McIlhenny, and R. O. Reid.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-203 857, Price codes: A10 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 437, March 1969. 203 p, 40 fig, 56 tab, 110 ref, 5 append. 14-01-0001-1161.

Descriptors: *Desalination, *Effluents, *Desalination wastes, *Environmental effects, *Temperature, *Salinity, *Copper, Phytoplankton, Diatoms, Dinoflagellates, Heat, Water treatment, Separation techniques, Physical properties, Chemical properties, Sea water, Desalination plants.

In estimating the ranges in chemical and physical properties of the effluents from large dual-purpose plants, the copper concentration in the effluents, the dispersion of effluents in the marine environment, and the ecological effects of the effluents were studied. Through analysis of the process streams of three desalination plants it was found that copper was more soluble in sea water concentrates than in sea water, with a minimum solubility at pH 7.5. Since the mixed effluent from a desalination plant is more dense than the receiving water, it tends to sink to the ocean floor. The theoretical aspects of a vertical jet of dense fluid were studied numerically and analytically. Experimental results obtained through using a laboratory model indicate that a dissolved constituent of the jet fluid would spread more rapidly in the lateral direction inside the core of the jet than momentum, and the constituent would spread more slowly than momentum in the outer region. Increasing temperatures in coastal waters tend to produce a simplification of the phytoplankton structure of the environment. A continuous supply of copper concentrations of about 0.05 ppm at 20C was found to be toxic to diatoms and dinoflagellates. Increasing temperatures increased the toxicity of copper to marine phytoplankton, while increasing salinities were found to have an antagonistic action on the toxicity of copper to them. PILOT PLANT TESTS AND DESIGN STUDY OF A 2.5 MGD HORIZONTAL-TUBE MULTIPLE-EFFECT PLANT.
Universal Desalting Corp., New York.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-200 905, Price codes: A09 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 492, October 1969. 156 p, 35 fig, 6 tab, 15 ref, 3 append. 14-01-0001-1707.

Descriptors: *Desalination, *Desalination plants, *Desalination processes, Horizontal tube multiple effect distillation, Evaluation, Heat transfer, Feasibility, Costs, Operating costs, Capital costs, Water costs, Water treatment, Water purification, Separation techniques, Design criteria, Wrightsville Beach(North Carolina).

In a new concept of multiple effect distillation equipment, the heat transfer tubes are horizontal with steam condensing on the inside and brine boiling on the outside; the effects are arranged vertically. The extensive tests conducted at the Wrightsville Beach, North Carolina, pilot plant show that the smooth horizontal tubes yield heat transfer coefficients which are 50 to 100% higher than those of smooth vertical tubes; however, the vertical arrangement with gravity flows eliminates all intereffect pumps and associated equipment. Design parameters were determined using this concept, and a 2,500,000 gpd plant was designed in sufficient detail to prepare reliable cost estimates. The total installed capital cost is $1,625,500, capital cost/gallon stream day is $.65, and operating cost/1000 gal is $.537. Detailed drawings of the 2.5 MGD horizontal tube multiple effect plant are provided. (Davison-IPA)

DEVELOPMENT OF PRECIPITATION PROCESSES FOR REMOVAL OF SCALE FORMERS FROM SEA WATER.
Grace (W. R.) and Co., Clarksville, MD. Washington Research Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-185 171, Price codes: A21 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 192, May 1966. 487 p, 86 fig, 143 tab, 22 ref, 11 append. 14-01-0001-323.

Descriptors: *Desalination, *Desalination process, *Evaporation, *Precipitation(Chemical), *Pretreatment(Water), Scaling, Phosphates, Calcium carbonate, Lime, Calcium compounds, Fertilizers, Phosphorus compounds, Separation techniques, Water treatment, Water purification, Water quality, Water quality control, Desalination apparatus.

The Wrightsville Beach pilot plant equipment was used to verify the laboratory work which developed the phosphate precipitation for removing calcium from sea water and producing a phosphatic byproduct raw material for the manufacture of fertilizer. The lime-magnesium carbonate (LMC) process for removing calcium from sea water was also tested on this equipment. Each process is described and, the laboratory studies and pilot plant operations for both are examined; the byproduct of the phosphate precipitation process is evaluated. Capital and manufacturing costs for both processes are discussed, as well as for byproduct recovery. It was shown that it is technically feasible to precipitate out all the magnesium and up to 99% of the calcium present in sea water by phosphate precipitation on a continuous pilot plant basis. It was also shown by pilot plant operation that the addition of magnesium carbonate trihydrate in the presence of calcium carbonate seeds, followed by lime, will precipitate up to 65% of calcium from sea water. It is concluded that in a single effect, forced circulation evaporator operating at 275F and 7/1 brine concentration, water treated by phosphate precipitation produced absolutely no scale; negligible deposits of calcium carbonate occurred, but a light coating of Mg(OH)2 and CaSO4 anhydrite was deposited in the heater tubes when sea water treated with calcium was fed to a single effect, forced circulation evaporator for 500 hours at 270F and 1.9 concentrations. WET-END SHOWERS AND WHITE WATER SHOWER SYSTEM CONSIDERATIONS,
Albany Engineered Systems, Glens Falls, NY.
H. R. Bissell.
Tappi (Atlanta, GA) Seminar Notes on Wet-End Operations, New Orleans, May 14-19, 1978, p 97-103. 1 appendix, 3 fig, 5 ref.

Descriptors: *Water reuse, *White water(Paper machines), Water pollution sources, Pulp wastes, Recycling, Industrial water, Pulp and paper industry, Effluents, Water conservation, Operation and maintenance, Corrosion control, Scaling, Slime, Filters, Valves, Pipelines, Storage tanks, Paper machines, Showers, Closed systems.

An important aspect of closing the paper-machine water system is the increased use of recycled water in shower sprays. Operating problems of such showers involve plugging or clogging of nozzles. Showers specifically designed for minimizing such troubles (self-cleaning or purgeable nozzles) are described, along with other components of the white water recirculation system (gravity strainers, white water chests or tanks, piping, flush valves, in-line pressure filter, etc.) and maintenance considerations (for control of corrosion, scale, and slime deposits). (Brown-IPC)

SALINE WATER CONVERSION BY DIRECT FREEZING WITH BUTANE,
Blaw-Knox Co., Pittsburgh, PA.
G. Karnofsky, and P. F. Steinhoff.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-161 819, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 40, July 1, 1960. 67 p, 16 fig, 9 ref. 14-01-001-176.

Descriptors: *Desalination, *Desalination processes, *Desalination plants, *Freezing, *Cornell process, *Economics, Costs, Estimated costs, Engineers estimates, Capital costs, Water costs, Water treatment, Separation techniques, Water purification, Sea water.

Laboratory work is the basis for an engineering study of a 10,000,000 gpd plant to produce fresh water from sea water using a system known as the Cornell Process. In this process, direct freezing is brought about by evaporation of a hydrocarbon refrigerant, butane, in contact with sea water. The ice is washed free of saline liquor, and then melted to potable water by the condensation of butane vapor. The total estimated cost for a plant utilizing electric drive is $10,524,000; product water cost is $.555/1000 gallons. For a plant using gas engines for the compressors, the capital investment is $11,874,000; product water cost is $.507/1000 gallons. While brackish water was not considered it is estimated that the cost of converting it would be $.10 less/1000 than sea water conversion. The engineering design is based on laboratory work which closely imitated a large scale operation. A flow diagram includes every major equipment item necessary in a complete plant. (Davison-IPA)

SOLAR STILL CONSTRUCTION,
New York Univ., NY. Engineering Research Div.
M. Telkes.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-161 404, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 33, August 1959. 21 p, 4 fig, 1 tab. 14-01-001-68 and 14-01-001-102.

Descriptors: *Desalination, *Desalination apparatus, *Solar distillation, *Solar stills, *Evaporation, Equipment, Design criteria, Structural design, Fabrication, Water yield, Efficiencies, Separation techniques, Water treatment, Water purification, Saline water, Solar radiation.

Specification and designs of the glass covered flat, tilted solar still and a multiple effect solar still are presented. The structural components and operation of the stills are described. Tilted surfaces receive more solar radiation than horizontal surfaces. The optimum year around tilt is equal to the geographical latitude. At the Office of Saline Water test installation in Daytona Beach, Florida, a tilt of 25 degrees from the horizontal facing south is most favorable. Theoretically, the maximum water yield is computed by using the factor of 1070 Btu/lb of water and assuming a 100% efficiency of the total solar energy used for evaporation. This efficiency cannot be attained by single effect stills because of inherent losses in transmission and operational heat loss, and heating of excess feed water. The multiple effect still presented combines the collection of solar energy with a 10 effect still tilted at 25 degrees from the horizontal. It is estimated that the efficiency of the 10 effect still is six times greater than a single effect of equal solar energy intercepting area. Drawings of the flat tilted still and the multiple effect still are provided. (Davison-IPA)

REMOVAL OF SCALE-FORMING COMPOUNDS FROM SEA WATER,
Grace (W. R.) and Co., Clarksville, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 406, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 66, September 1962. 100 p, 19 fig, 44 tab, 36 ref. 14-01-001-202.

Descriptors: *Desalination, *Pre-treatment(Water), *Descaling, *Fertilizers, Ammonium compounds, Phosphates, Scaling, Economic feasibility, Sea water, Trace elements, Water analysis, Water chemistry, Water treatment, Desalination plants, Research and development, Water quality, Water quality control, Distillation.

An investigation was undertaken to determine the economic feasibility of preparing a high analysis fertilizer from the scale-forming elements removed in the pretreatment of raw sea water, and to determine the ore potential of sea water. Magnesium, calcium and the trace elements, iron, zinc, copper, manganese and cobalt were precipitated from sea water as metal ammonium phosphates and other phosphates with phosphoric acid and ammonia. The descaled sea water was ready to be used in a water conversion plant. The slurry of precipitated solids, i.e., fertilizer was dehydrated by heating, then filtered, washed, granulated and dried. This fertilizer has low solubility, is non-burning, non-leaching and long acting. Assuming a descaling of one mgpd capacity the fertilizer produced would have to command a price higher than that of conventional fertilizers unless a reduction in the cost of raw materials is achieved through technological improvements. It is anticipated that various other metals will eventually be separated from sea water or the waste evaporator brine. Future metal recovery processes may utilize the fertilizer produced by this process as a raw material. (Davison-IPA)

EFFECTS OF IMPRESSED ELECTROSTATIC FIELDS ON THE SALT WATER/AIR INTERFACE,
Tracor, Inc., Austin, TX.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 407, Price codes: A04 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 67, September 1962. 54 p, 18 fig, 2 tab, 20 ref. 14-01-001-200.

Descriptors: *Desalination, *Desalination processes, *Electrophoresis, Interfaces, Boundaries, Air-water interfaces, Separation techniques, Measurement, Surface tension, Drops, Electrodes, Desalination apparatus, Salinity, Saline water, Impressed electrostatic fields, Water treatment, Water purification.

Surface tension changes were measured after electrostatic fields of up to 6700 v/cm, positive and negative, were applied to air/NaCl-solution interfaces; salt concentration ranged from 0 to 3.5%. The surface tension of all solutions investigated was lowered by both field directions, with the positive air electrode lowering the surface tension of pure water less than a negative air electrode. It now appears that the field at the air-water interface is smaller than the 10 to the seventh vcm previously thought present, that the orientation of the water dipoles at the interface is slight, and that the predominant small orientation present is with the hydrogen atoms facing the air. Data from calculating the surface deficiency of NaCl solutions under applied electric fields with the Gibbs equation show that a positive air electrode increases the surface deficiency and a negative air electrode decreases it. An attempt to use a skimming apparatus to measure directly the surface concentration change revealed that its usefulness depended on the ability to analyze the skimmed and unskimmed position with accuracy. This was not possible for NaCl solutions up to 3.5%. It is concluded that surface concentration changes of NaCl solutions due to applied electrostatic fields are too small to be measured quantitatively and are unsuitable for practical desalination processes. (Davison-IPA)

TEMPERATURE DISTRIBUTION IN THE CRYSTALLIZATION OF UNDERCOOLED LIQUIDS IN CYLINDRICAL TUBES,
Massachusetts Inst. of Tech., Cambridge.
P. L. T. Brian, and P. R. Sperry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 673, Price codes: A04 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 98, May 1964. 50 p, 6 fig, 3 tab, 13 ref, 5 append. 14-01-0001-295.

Descriptors: *Desalination, *Crystallization, *Temperature, *ice-water interfaces, Boundaries(Surfaces), Boundary layer, Crystals, Growth rate, Nucleation, Supercooling, Separation techniques, Laboratory tests, Heat transfer, Equations, Numerical analysis, Water treatment, Water puification.

An analysis of the planar interface morphology observed in capillary crystallization experiments is discussed. One technique for determining crystallization kinetics of undercooled liquids consists of nucleating a seed crystal with the desired crystallographic orientation in one end of a capillary tube filled with the liquid under investigation. After nucleation the preparation is placed in a bath held at a constant temperature below the equillibrium freezing point of the liquid. The rate of crystal growth is determined by measuring the position of the solid-liquid interface as a function of time. When the temperature of the cooling bath is adjusted to correspond to various degrees of supercooling the curve showing the dependence of growth rate of the crystal face on undercooling can be obtained with one seed crystal. The temperature at the crystal-liquid interface is greater than the temperature of the cooling bath, because the latent heat of fusion is liberated at the interface during crystal growth. A planar interface for crystals growing normal to the hexagonal basal plane was observed. Numerical values of interface temperature rise as a function of the parameters of the capillary crystalization experiment are presented. (Davison-IPA)

RESEARCH ON SALINE WATER CONVERSION BY FREEZING,
Massachusetts Inst., of Tech., Cambridge.
T. K. Sherwood, and P. L. T. Brian.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 593, Price codes: A04 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 96, March 1964. 52 p, 14 fig, 20 ref. 14-01-0001-295.

Descriptors: *Desalination, *Desalination processes, *Freezing, *Laboratory tests, Laboratory equipment, Membranes, Crystallization, Mathematical studies, Ice-brine interfaces, Saline water, Salinity, Water treatment, Water purification, Separation techniques.

The progress of three investigations in the research related to freezing as a desalination process are reported: (1) a study of the effect of salt build-up at a phase boundary across which water only is removed from brine; (2) an experimental and theoretical study of counter-current washing to remove brine from ice-brine 'slush'; and (3) a basic study of the effect of additives on crystallization of supercooled water. In an experimental study of the salt buildup phenomena, a porous hollow rotating cylinder coated with an osmotic membrane is used to separate water from salt solution with pressure applied to the external salt solution. Two preliminary experiments made with cellulose acetate membranes showed that the equipment operated satisfactorily. The washing investigations carried out on glass and plastic beads and batch washing of brine from a mass of small ice crystals are described. A summary of mathematical analysis of experiments to determine the interface temperature in capillary crystallization experiments is presented. Background information in these areas from the literature is discussed. (Davison-IPA)

STUDY OF MULTI-PHASE EJECTORS FOR DISTILLATION DESALINATION SYSTEMS,

Kaye (Joseph) and Co., Inc., Cambridge, MA.
C. A. Kemper, G. F. Harper, S. W. Gouse, and J. H. Leigh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 594, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 97, January 1964. 80 p, 25 fig, 9 ref, 3 append. 14-01-0001-329.

Descriptors: *Desalination, *Desalination processes, *Evaporation, *Multi-phase ejectors, Physical properties, Temperature, Energy, Differential thermal analysis, Friction, Viscosity, Pumps, Performance, Vapor compression distillation, Water treatment, Water purification, Separation techniques.

The results of this detailed, theoretical study of single stage evaporation system incorporating a multi-phase ejector (MPE) to achieve the driving temperature difference, can be interpreted in terms of various vapor evaporation systems or various freezing systems. Evaporator temperatures of 150 to 350F and evaporator temperature differences of 5 and 10F were used, and the effects of pump efficiency, viscous friction, and mixing irreversibility in the MPE were considered. For given operating conditions pure work-input MPE desalination systems were the most attractive from an overall energy requirement basis when 25% efficiency was assumed for the heat engine producing the required work-input. Upon examining the possibility of staging various types of MPE desalination systems, it was found that pure work-input systems would most likely be operated as single stage systems. The results of comparing an ideal pure work-input MPE system and a reversible adiabatic vapor compression system indicate that the MPE system is more attractive on a work-input basis. Economically, it would be less costly to replace the liquid pump of the MPE system than to replace a vapor compressor. MPE desalination systems are described, and the analytical methods used, and discussions of the results are presented in the appendices. (Davison-IPA)

SALT CONCENTRATION AT PHASE BOUNDARIES IN DESALINATION PROCESSES,
Massachusetts Inst. of Tech., Cambridge.
T. K. Sherwood, P. L. T. Brian, and R. E. Fisher.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 592, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 95, March 1964. 51 p, 8 fig, 2 tab, 16 ref, 1 append. 14-01-0001-295.

Descriptors: *Desalination, *Desalination processes, *Salt build-up, Membranes, Membrane processes, Reverse osmosis, Osmosis, Osmotic pressure, Flow, Mass transfer, Boundary processes, Boundaries(Surfaces), Flow resistance, Flow separation, Laminar flow, Turbidity, Separation techniques, Water treatment, Water purification.

The theory of the salt build-up phenomena is examined. Salt build-up can be serious in water removal by freezing, solvent extraction and reverse osmosis. When occurring at the surface of an osmotic membrane, it causes the effective osmotic pressure to be greater than the osmotic pressure of bulk brine, and the operating total pressure must be increased by this increment to maintain the desired water withdrawal flux. The importance of salt build-up can be estimated using the existing theories of diffusion and mass transfer. Such estimates for turbulent and laminar flow of brine past the surface of an osmotic membrane are presented. An analysis of these suggests that the salt build-up phenomena can be a serious obstacle to the development of reverse osmosis desalination processes. An analysis for constant water flux in the case of flow in a two-dimensional duct develops the relations expressing the salt concentration as a function of membrane spacing, duct length, and brine flow velocity for all positions in the channel. Numerical examples show that salt build-up may not be serious for high brine velocities with modest water removal rates. However, salt build-up at the surface of reverse osmosis membranes is serious even with the modest water fluxes attainable with present-day membranes. With the development of better membranes which permit greater water production rates, the salt build-up phenomena will become increasingly important. (Davison-IPA)

RESEARCH AND DEVELOPMENT OF BADGER-HICKMAN CENTRIFUGAL DISTILLATION TECHNIQUES AND EQUIPMENTS.
Badger Co., Inc., Cambridge, MA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-161 387, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 12, November 1956. 84 p, 33 fig, 7 tab. 14-01-001-65.

Descriptors: *Desalination, *Desalination apparatus, *Desalination processes, *Destillation, *Evaporation, Heat transfer, Design criteria, Laboratory tests, Sea water, Water treatment, Separation techniques, Water purification.

The development and operation of the vapor-compression distillation apparatus for saline water, Number 3 and Number 4 machines, are discussed. These machines are based on the principle of high-velocity flow of thin films of water over the heating surfaces at temperatures below the limit of scale forming. Machine Number 3 was constructed with 18 inch rotors. Heat transfer efficiency was demonstrated on sea water in a test run of over 300 consecutive hours. Machine Number 4 using five foot diameter disks was constructed and operated on sea water and tap water to extend and confirm the information obtained on the smaller machines and to explore the effect of increasing size on the practicability and efficiency of centrifugal evaporator recompression stills. Data from the tests of both machines is presented in tabular form. Engineering designs for a 25,000 gpd unit were developed based on the investigations of the Number 3 and Number 4 machines. Sketches of the design and a description of the process are presented. The investigations demonstrated that heat transfer rates five to seven times as high as those of sea water evaporators can be maintained. This type of thermocompression equipment has the potential to distill water with about one half the fuel requirement of conventional vapor-compression equipment. (Davison-IPA)

NEW AGENTS FOR USE IN THE HYDRATE PROCESS FOR DEMINERALIZING SEA WATER,
Syracuse Univ., NY. Dept. of Chemical Engineering and Materials Science.
F. A. Briggs, Y. C. Hu, and A. J. Barduhn.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 143, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 59, March 1962. 44 p, 8 fig, 15 tab, 23 ref, 1 append. 14-01-001-177.

Descriptors: *Desalination processes, *Hydrate processes, Hydrates, Hydration, Crystals, Crystal growth, Equilibrium, Aqueous solution, Saline water, Heat exchangers, Separation techniques, Water treatment, Water purification, Temperature, Thermal properties, Energy.

The results of research conducted on the properties of gas hydrates from July 1960 to June 30, 1961 are reported. The process of screening compounds as possible hydrate formers has been completed, and phase relations for methyl bromide, F-21, F-31, and F-142b were determined in the presence of pure water and aqueous NaCl solutions with concentrations up to 10% NaCl. The following information was calculated for each hydrate: heat of formation, composition of the solid hydrate, and the depression of the formation temperature due to NaCl and sea salts. Calculations of energy and heat exchanger requirements for the hydrate process with six different hydrating agents are summarized. The heats of formation of methyl bromide, F-21, and F-31 were revised. The relative merits of various hydrating agents are discussed. The most economical agent for use in the hydrate process has not yet been selected. (Davison-IPA)

DEVELOPMENT OF AN IMPROVED SOLAR STILL,
Georgia Inst. of Tech., Atlanta. Engineering Experiment Station.
W. N. Grune, R. A. Collins, R. B. Hughes, and T. L. Thompson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 144, Price codes: A07 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 60, March 1962. 127 p, 44 fig, 5 tab, 23 ref, 2 append. 14-01-001-178.

Descriptors: *Desalination, *Desalination processes, *Solar distillation, *Desalination apparatus, *Solar stills, Solar radiation, Design criteria, Efficiencies, Coolants, Equipment, Separation techniques, Water treatment, Water purification, Water yield, Treatment, Condensation, Evaporation.

Nine major still designs were studied in an effort to increase the fresh water yield from solar distillers. Natural convection designs, used as controls, also provided information regarding the transfer of vapor between the brine surface and cover. It was observed that the resistance to mass transfer increased with the difference in temperature between the brine and cover raised to the two-thirds power. The overall performance of the designs suffered when multiple glazings were used to increase the operating temperatures, because the increased reflection and insulation losses offset the increase in internal operating efficiency. In the forced convection design, air is blown through the still between the brine and cover into an external water cooled condenser. The deep basin design, equipped with a brine dispersion tray to increase the mass transfer area, was the most efficient of those investigated. It exhibited an optimum air flow rate of 6 cfm and operated at 50 to 60% efficiency. Because of high reflux losses and the reflection of solar radiation by droplets of condensate on nonwettable covers, shallow basin units without brine dispersion were less successful. Experimentation with recirculating the condenser coolant to increase production indicated that the increase was insufficient to justify the additional equipment involved. The most effective design studied was a multiple-depth forced convection unit which produced over two gallons/sq yd. (Davison-IPA)

INVESTIGATION AND PREPARATION OF POLYMER FILMS FOR SALINE WATER CONVERSION,
Monsanto Research Corp., Everett, MA. Boston Labs.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 297, Price codes: A04 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 61, April 1962. 56 p, 18 fig, 11 tab, 6 ref, 3 append. 14-01-001-203.

Descriptors: *Desalination, *Membranes, *Membrane processes, *Reverse osmosis, Mass transfer, Permeability, Desalination apparatus, Porosity, Physical properties, Chemical properties, Separation techniques, Water treatment, Water purification, Saline water, Cellulose acetate.

In an evaluation of currently (1960-61) available film formers for use in the desalination of sea water the effects of glycol additives on cellulose acetate I and II were studied. Casting techniques and pre- and post-conditioning methods were examined, and the suitable films were tested in a permeation assembly at varying temperatures under varying conditions of water separation. The experimental measurements were used to calculate the permeation coefficient, the efficiency of desalination, and the solubility coefficient. Of the other polymers tested as desalination membranes only polyvinyl alcohol showed potential. The other films were too brittle and ruptured when pressure was applied.

Two theories of the mechanism of water transmission were considered to explain the desalination of sea wate by the reverse osmosis process. The micropore theory states that water transmission through a polymeric film occurs by the passage of water molecules through the pores in the film which are too small to permit the passage of salt. In the second theory permeation takes place in three independent steps: (1) solution of the permeating molecules in the upstream face of the film; (2) diffusion of permeant molecules through the film matrix; and (3) evaporation of the permeant from the downstream face of the film. The successful use of low molecular weight hydrophilic materials as polymeric film modifiers supports the hydrogen bonding theory of transmission through the film. (Davison-IPA)

SEAWATER SOFTENING BY ION EXCHANGE AS A SALINE WATER CONVERSION PRE-TREATMENT,
Dow Chemical U. S. A., Freeport, TX. Texas Div.
W. F. McIlhenny.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 298, Price codes: A07 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 62, May 1962. 141 p, 49 fig, 30 tab, 19 ref, 4 append. 14-01-001-205.

Descriptors: *Desalination, *Pre-treatment(Water), *Water softening, *Cation exchange, *Resins, Water chemistry, Costs, Capital costs, Sea water, Evaporation, Alkalinity, Scaling, Equilibrium, Water treatment, Water purification, Separation techniques, Calcium compounds, Magnesium compounds.

The partial softening of sea water for use as a feed for desalination plants is discussed. The incoming sea water was softened by fluidized flow with a cation exchange resin, and the concentrated evaporation blowdown liquor was used as the sole regenerant for the ion exchange resin. Data on the method of softening, cycle times and flows, and softening efficiencies obtained are reported. Variable effects on softening efficiencies were studied. A large scale cost estimate based on pilot plant data is given. Four phases of evaporator operation were studied: (1) no sea water softening or alkalinity control; (2) soft sea water and no alkalinity control; (3) soft sea water with alkalinity control; and (4) a softened groundwater from Roswell, New Mexico. For each phase evaporator scaling rate, diesel usage, and distillate production were determined; scales were analyzed. The physical characteristics of the ion exchange resins as affected by plant operation were studied. Equilibrium data for the sea water-resin system are provided with a method for calculating the ternary ion system. It is concluded that sea water is sufficiently softened by cation exchange, preventing CaSO4 precipitation when the soft sea water is evaporated to four times normal sea water; the total concentration of the raw sea water had the most significant effect on the ability of the cation exchange resin to remove calcium. Capital costs for a 10,000,000 gpd plant producing a brine concentration of four times normal sea water are 1961 $1,610,000, with sea water softening costs at $.094/1000 gallons. (Davison-IPA)

ANNUAL REPORT (FY 1969), ROSWELL TEST FACILITY ROSWELL, NEW MEXICO,
Westinghouse Electric Corp., Orange, CA. Water Province Dept.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-201 014, Price codes: A06 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 529, February 1969. 101 p, 21 fig, 22 tab, 1 append. 14-01-0001-1808.

Descriptors: *Desalination, *Desalination plants, *Roswell Test Facility, Vapor compression distillation, Evaporation, Scaling, Descaling, Calcium compounds, Brackish water, Water treatment, Water purification, Separation techniques, Research and development, Roswell(New Mexico).

The double-effect forced-circulation evaporator plant at Roswell, New Mexico, has been expanded to include an evaporator as an auxiliary test unit, membrane pilot plants, a pilot scale feed water treatment system, and a laboratory. During the past year the operation policy was changed from a demonstration plant to a development and test facility. The seed slurry method was modified and was successful in demonstrating the prevention of scale formation. The test bed plant equipment was 'moth balled' until a study was completed to determine the feasibility of repairing the compressor or replacing it with the High Temperature Water Jet Compressor. The three phases of the Auxiliary Test Unit (ATU) calcium solubility investigations are discussed, and a schematic of this system is provided in the appendix. A silica removal system manufactured by the Johns-Manville Corporation and installed in the ATU system was successfully operated in two 100-hour evaluation runs. Replacement of its exchange media was necessary due to calcium carbonate and calcium sulfate fouling which occurred during operation on raw brackish feed water. When the feed was presoftened brackish water silica removal was 100%. Lay-up of the large plant which began in July 1968 was completed before March 1969. (Davison - IPA)

FINAL REPORT ON FOAM FRACTIONATION OF INORGANIC SOLUTIONS,
Horizons, Inc., Cleveland, OH.
J. J. Bikerman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-200 922, Price codes: A04 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 510, January 1970. 54 p, 4 fig, 65 tab. 14-01-0001-2118.

Descriptors: *Desalination, *Pre-treatment(Water), *Calcium, *Iron, *Manganese, *Brackish water, *Foam fractionation, Aqueous solutions, Foam separation, Metals, Surfactants, Treatment, Water purification, Water treatment, Desalination processes, Laboratory equipment, Sulfates, Water quality, Water quality control.

An investigation was undertaken to develop a method of pre-treating brackish water to facilitate the main desalination step involved in membrane processes. Calcium, iron and manganese were partially removed from the aqueous solutions of their salts by adding a foaming agent to the solution and bubbling air through it. The resulting foam contained a higher concentration of the metal than the initial residue or the residual solution. Greater concentrations of iron and manganese were found than for calcium in comparable conditions. The long-chain sulfates and poly (oxyethylene) sulfates showed the most potential of the many commercial foaming agents tested. The non-ionic surfactants were unsatisfactory. It was found that the accumulation ratio, i.e., the ratio of metal concentration in the foam to that in the initial solution, generally increases when the drainage time of the foam and the weight ratio 'surfactant:metal' increase. The accumulation ratio for the surfactant increases with the duration of drainage. The experimental results for the removal of calcium, iron and manganese are tabulated. (Davison - IPA)

KINETICS OF ICE NUCLEATION FROM WATER AND ELECTROLYTE SOLUTIONS,
Case Western Reserve Univ., Cleveland, OH.
G. R. Wood, and A. G. Walton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-200 913, Price codes: A09 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 500, November 1969. 180 p, 25 fig, 9 tab, 90 ref, 4 append.

Descriptors: *Desalination, *Desalination processes, *Freezing, *Electrolytes, Aqueous solutions, Ice-water interfaces, Nucleation, Drops, Crystal growth, Kinetics, Energy, Physical properties, Oil-water interfaces, Environmental influences, Water treatment, Water purification, Separation techniques.

The homogeneous nucleation of ice was experimentally characterized and the applicability of nucleation theory was tested. Nucleation rates for the formation of ice from electrolyte solutions and water were calculated from observations of the frequency with which liquid droplets solidify. The stochastic nature of droplet freezings was considered and statistical methods were used for weighing observations and predicting experimental errors. Methods were found for incorporating the solidification dependencies in the rate calculations. The environmental influence on the water droplets, tested by varying the emulsion oils, droplet substrates and water purity, were found to be ineffective. Isothermal and continuous cooling experiments yielded nucleation rates which were in good agreement with each other; their temperature dependence was in accord with the functional relationship predicted by theory. The rate's temperature dependence indicated a transition to a homogeneous nucleation mechanism. Decreasing water activity and an increasing ice-solution interfacial energy were related to the increase in the isokinetic supercoolings for sodium chloride solutions. The surface energies and their temperature dependence indicate that the presence of an electrolyte disrupts the orientation of water molecules at the ice surface. It was not possible to differentiate the dependence of this effect on the specific nature of alkali halide electrolytes from experimental uncertainties. (Davison-IPA)

SECONDARY NUCLEATION OF ICE IN A SUSPENSION OF CRYSTALS IN TURBULENT CYLINDRICAL COUETTE FLOW,
Clarkson Coll. of Technology, Potsdam, NY.
J. Estrin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-200 907, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 494, January 1970. 77 p, 22 fig, 6 tab, 54 ref, 3 append. 14-01-0001-971

Descriptors: *Desalination, *Freezing, *Desalination apparatus, *Couette flow apparatus, *Nucleation, *Ice-brine systems, Boundaries(Surface), Crystallization, Crystal growth, Separation techniques, Water treatment, Saline water, Water purification, Water quality.

The use of a cylindrical Couette flow apparatus in an experimental investigation into the secondary nucleation characteristics of ice-brine slurries is discussed. This apparatus was selected because of its agitation characteristics and its large heat transfer surface to active volume ratio; it consists of two, vertical, concentric cylinders with the slurry of crystals contained in the annulus between them. The unit was employed with the ice-brine system to generate ice crystals with continuous and batch methods of operation. Stable deposition of ice upon the cooling surfaces, the major operational problem, was more severe in continuous operation experiments than in batch experiments. The combination of continuous and batch crystallization experiments is suggested as potentially providing the most meaningful results in the secondary nucleation process. The level of agitation appears to be an important variable determining nucleation kinetics. It is concluded that the Couette flow apparatus is a useful means for investigating the secondary nucleation characteristics of ice-brine slurries. (Davison-IPA)

DIFFUSION IN TERNARY AQUEOUS SALINE SOLUTIONS,
Loyola Univ., New Orleans, LA.
R. P. Wendt, and M. Shamim.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-200 917, Price codes: A04 in paper copy, A01 in microfiche. OSW Research and Development Progress Report

No. 504, December 1969. 72 p, 7 fig, 16 tab, 31 ref, 5 append. 14-01-0001-1303.

Descriptors: *Aqueous solutions, *Saline solutions, *Diffusion, *Saline water systems, *Electrolytes, Ions, Magnesium compounds, Sodium compounds, Sea water, Computer programs, Laboratory equipment, Desalination, Water analysis, Water chemistry.

An investigation of the electrolytic ternary system H20-MgC12-NaCl, containing divalent ions, was undertaken to help technologists working with systems similar to sea water. Various diffusion theories in ternary systems and theories for predicting diffusion coefficients are discussed. The experimental and theoretical procedures described include: preparation of solutions, cell calibration, and methodology. Physical methods of solution analysis were selected. It was found that to obtain maximum accuracy in determining some coefficients the solutions should be analyzed chemically or physically for each solute; this would involve a great number of lengthy analyses. The rotating diaphragm diffusion cell developed for the experimental work required no maintenance or recalibration. The solution concentrate it uses must be slightly greater than C=0.05M to avoid solute-porous glass disc interactions. This cell cannot be used with nonaqueous systems. In this study the large cross-term coefficients D12 and D21 measured for each of the H20-MgC12-NaCl systems indicated that errors may be introduced by assuming electrolyte solutes in multicomponent systems diffuse independently according to Fick's law. Computer printouts of the programs for calculating diffusion coefficients and activity coefficient derivatives are provided in the appendices. (Davison-IPA)

FEASIBILITY, RESEARCH AND ANALYSIS OF HEAT EXCHANGE SYSTEMS WITHOUT HEAT EXCHANGE SURFACES: LABORATORY STUDY OF SINGLE STAGE VAPOR REHEAT DISTILLATION,

FMC Corporation, Santa Clara, CA. FMC Machinery/Systems Group.
W. S. Thompson, T. Woodward, W. A. Shrode, E. D. Baird, and D. A. Oliver.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 299, Price codes: A13 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 63, April 1962. 272 p, 41 fig, 25 tab, 28 ref, 2 append. 14-01-001-163, -173-217.

Descriptors: *Desalination, Desalination apparatus, *Heat exchangers, *Distillation, Heat transfer, Organic compounds, Solubility, Drops(Fluid), Particle size, Flash distillation, Separation techniques, Water treatment, Water purification, Sea water.

The research is presented in two parts. In Phase One of Part A, the literature was reviewed with regard to free rise or fall of liquid drops in water, flooding velocities in spray columns, and heat transfer coefficients in spray columns. Of the three potential heat exchange liquids studied and tested, hydrocarbons of high molecular weight appeared most suitable as heat-exchange media. Calculations were made to determine the approximate size of equipment required for a 10,000,000 gpd sea water distillation plant. In Phase Two of Part A certain properties of hydrocarbons were discussed regarding shell fluids. Each of the following specific subject areas are treated independently: (1) the solubility of hydrocarbons in water and the solubility of water in hydrocarbons; (2) the effect of variable specific heat on the performance of a heat exchanger; and (3) the rate of rise of hydrocarbon drops in water and the effect of drop size on the dimensions of the heat exchanger. In Part B the construction and operation of experimental heat exchangers is discussed. The data obtained indicates that heat transfer is approximately a linear function of oil fluidity for top hot operation. Other variables affecting heat transfer include flow rate and direction of heat flow. It was found that heat transfer is practically independent of orifice diameter. (Davison-IPA)

DETERMINATION OF THE PRACTICALITY OF THE OSMIONIC PROCESS,

Southern Research Inst., Birmingham, AL.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 345, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 64, August 1962. 96 p, 25 fig, 11 tab, 4 append. 14-01-001-193.

Descriptors: *Desalination, *Desalination processes, *Osmionic process, *Demineralization, *Economic feasibility, *Project feasibility, Resistance, Membrane processes, Separation techniques, Water treatment, Water purity, Water purification, Costs, Estimated costs, Laboratory tests, Laboratory equipment.

An eight cell bench-scale osmionic demineralizer was developed in which the demineralization performance closely approached theoretical predictions. The final design, evaluated experimentally in short term runs, gave trouble-free operation during two weeks of intermittant operation. It is believed that changes in the physical design would not effect major improvements in demineralization performance. Experimental work validated the corrected theoretical expressions describing demineralization performance. It was found that the usual methods for measuring membrane resistance gave values that may not be representative of the actual resistance occurring during demineralization. A study was made to determine which methods of measuring resistance and transference in membranes would give values representing their actual occurrence during demineralization. Cost estimates show that demineralization by the osmionic process would be two to three times as much demineralization by electro-dialysis. (Davison-IPA)

INVESTIGATION OF THE USE OF ACOUSTIC VIBRATIONS TO IMPROVE HEAT TRANSFER RATES AND REDUCE SCALING IN DISTILLATION UNITS USED FOR SALINE WATER CONVERSION.

Southwest Research Inst., San Antonio, TX.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 346, Price codes: A08 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 65, August 1962. 158 p, 43 fig, 29 tab, 8 ref. 14-01-001-188.

Descriptors: *Desalination, *Heat transfer, *Boiling, *Vibrations, *Acoustics, *Reynolds number, Flow, Water analysis, Separation techniques, Water treatment, Desalination apparatus, Condensation, Steam, Resonance, Standing waves.

A boiling heat transfer study was undertaken to define the magnitude of heat transfer improvement and the limits of heat flux over which vibration of the heat transfer surface might improve nucleate boiling coefficients. The effect of vibration on heat transfer from the inner tube to water in forced axial flow through an annulus was investigated at Reynolds numbers of 5,000 to 28,000. Increased heat transfer rates were produced by transverse vibration of the inner tube, and improvement with annulus ratios was greater at low flow Reynolds numbers. However, the economic advantage increased with increasing Reynolds numbers. The use of resonant acoustic vibrations in water was studied. Considerably less improvement in forced convection heat transfer was produced than for vibration of the heat transfer surface. Increases in steam condensation rates up to 122% were observed in the study of the effect of vibration of the heat transfer surface on steam condensation. Vibration on nucleate boiling transfer was investigated over heat flux ranges of 2,300-15,200 and 50,000-250,000 Btu/hr-sq ft. Boiling heat transfer coefficients increased as high as 133% at a heat flux of 4,000 Btu/hr-sq ft with inner tube variation at its resonant frequency of 38 cps and an amplitude of 0.35 sec. It is concluded that the use of vibration of the heat transfer surface to improve heat transfer in desalination has potential economic advantage (Davison-IPA)

DIFFUSION STILL ANALYSIS,

General Electric Co., Burlington, VT. Advanced Science and Technology Lab.
P. Kroeger.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 672 Price codes: A13 in paper copy, A01 in microfiche OSW Research and Development Progress Report No 99, April 1964. 283 p, 93 fig, 55 tab, 25 ref. 14-01-0001-314.

Descriptors: *Desalination, *Desalination apparatus *Diffusion still, Evaluation, Feasibility, Heat transfer, Mass transfer, Computer programs, Equations Separation techniques, Water treatment, Water purification, Laboratory tests, Laboratory equipment Saline water, Scaling, Corrosion.

Experimental and analytical work was undertaken to determine the feasibility and performance capability of the diffusion still process. Single-stage and multi-stage performance models were developed to study the heat and mass transfer mechanism and to permit performance predictions beyond the range of the available test equipment. A system of equations describing the heat and mass transfer in a single-stage unit was developed, and solved in a computer program. In comparing the computed single-stage results with test data from the literature good agreement was found for reservoir-condenser temperature differences below 35F. The multi-stage system was treated as a series of single stages. The system of equations developed for describing a multi-stage diffusion still was also solved in a computer program, and the results were in satisfactory agreement with test data from the literature. The influence of various design and process parameters for both the single- and multi-stage performances were studied. The losses occurring in the multi-stage unit during testing were inherent in the design of the unit rather than the diffusion still process itself. The main loss was by direct evaporation of incoming reservoir water and condensation of this water within the condenser. An inspection after saline water tests revealed no scale formation occurred, but the use of the combination of a copper condenser and aluminum disks resulted in some aluminum corrosion. (Davison-IPA)

HIGH-TEMPERATURE TRANSFERENCE NUMBERS IN PURE AND MIXED AQUEOUS ELECTROLYTES,

Southern Research Inst. Birmingham, AL.
E. B. Dismukes.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 581, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 87, March 1964. 38 p, 9 fig. 14-01-0001-254.

Descriptors: *Electrolytes, *Aqueous solutions, *Moving boundary method, Electrochemistry, Anions, Cations, Water properties, Desalination, Desalination processes, Laboratory tests, Temperature separation techniques, Water treatment, Water purification.

A research program was undertaken to obtain fundamental information on the properties of aqueous electrolytes by measuring and interpreting transference number data under conditions where a paucity of data exists. Electrolytes containing sodium and magnesium cations and chloride and sulfate anions were studied. Transference measurements were made with the moving boundary method, and an electrometric technique was used to determine displacement rates. The results of the procedures were unsatisfactory in reproducibility. The range in results from duplicate experiments frequently differed from the desired accuracy of approximately 0.05% by 0.2% or more. The precision of data obtained from experiments with transference in NaCl solutions showed the effect of temperature variations at temperatures up to 125C. In other experiments the precision was unaccepta-

ble. It is thought that variations in the diffuseness of the moving boundary may be responsible for the poor reproducibility in transference data. (Davison-IPA)

SECOND ANNUAL REPORT, SALINE WATER DEMONSTRATION PLANT NO. 1, FREEPORT, TEXAS,
Stearns-Roger Corp., Denver, CO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 681, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 100, March 1964. 92 p. 20 fig, 5 tab. 14-01-001-218.

Descriptors: *Desalination, *Desalination plants, *Desalination processes, *Long-tube vertical multiple effect evaporation, Demonstration Plant No. 1, Freeport(Texas), Equipment, Materials, Analysis, Sea water, Water treatment, Water purification, Separation techniques, Evaporation, Scaling, Water yield, Research and development, Water costs.

Technical, economic, and logistical evaluations of the Long-Tube Vertical (LTV) multiple evaporation method of desalination employed by Demonstration Plant No. 1, Freeport, Texas, are reported for the period July 1, 1962 to June 30, 1963. Results of a microbiological survey indicated no corrosion and only very minor problems in other areas. An intensive deaerator performance investigation shows that 2000 lbs/hr of steam are required for maximum carbon dioxide and oxygen removal. The maximum production of the plant was determined to be 1,200,000 gpd. The factors limiting the equipment at this capacity were P-17 brine pump and maximum temperature (without scaling) to the first effect evaporator. No definite conclusions have been formulated from data compiled to determine the operating efficiency of the heat exchangers and the evaporators. Despite a 93 and one-half day shut down for maintenance total annual production and cost figures compare favorably with those of the previous year. Total production for the period was 250,183,830 gallons, and average total unit gross cost/1000 gallons was $1.68. The major technical facets, process, equipment, and materials analyses were evaluated based upon the experimental and operational data compiled during the period. (Davison-IPA)

RESEARCH AND DEVELOPMENT ON REVERSE OSMOSIS MEMBRANE MODULES,
General Atomic Co., San Diego, CA.
V. Merten.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-177 204, Price codes: A04 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 165, January 1966. 62 p, 21 fig, 6 tab, 2 append. 14-01-0001-426.

Descriptors: *Desalination, *Desalination processes, *Reverse osmosis, Membranes, Materials testing, Fabrication, Operations, Strength of materials, Compressive strength, Plastics, Separation techniques, Water treatment, Water purification.

Work on the spiral-wound reverse osmosis membrane module is reported from the time of its conception to July 1, 1965. Emphasis during the past year was (1) on finding suitable product water side backing materials which would support the membrane and at the same time allow the product water to be removed, and (2) on the fabrication method of the modules. Compression strength requirements and pressure drop were considered in selecting the product water side and brine side spacer design. The most promising materials selected include plastic materials for the brine side spacer in all systems and for the product water side space in low-pressure systems; and or glass bead materials were selected for the product water side spacer in high pressure systems. Two types of modules are being fabricated. The first type utilizing plastic backing material suitable for long-term use at pressures up to 200 psi, has been tested extensively and is considered reliable for use in commercial systems. The second type utilizes glass beads as the backing material and is suitable for system pressures of 1500 psi and above. The modules performed well as complete units at pressures up to 400 psi. Module performance test data are presented and the test loop is described. (Davison-IPA)

THE INFLUENCING OF HIGH MOLECULAR WEIGHT ADDITIVES ON THE FLASHING PROCESS (A SCREENING STUDY),
Houston Research Inc., TX.
A. E. Dukler, and R. F. Castle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-200 926, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 515, April 1967. 25 p, 10 fig, 1 tab. 14-01-0001-530.

Descriptors: *Desalination, *Desalination processes, *Multi-stage flash distillation, *Additives, *Polymers, Organic compounds, Plastics, Chemicals, Drag, Resistance, Weight, Equipment, Laboratory tests, Mass transfer, Equilibrium, Separation techniques, Water treatment, Water purification.

Three high molecular weight polyethylene oxide polymers were mixed with distilled water to form an additive solution in an evaluation of their significance in drag reduction in flash systems. The experimental equipment consisted of a Plexiglas single stage flash chamber with a liquid holding chamber, rectangular underflow orifice, a flash liquid splash plate, and a liquid baffle; other equipment consisted of a steam jet vacuum system, reservoir and pump. During the 14 test runs the additive rate was measured by volume change in the feed tank. The test runs were made with different additives at different rates, and with different conditions of vacuum, temperature, and flashing of liquid. Although the amount of drag reduction was not significant with these additives, they did cause more uniform bubble distribution downstream of the orifice. This is expected to cause improved mass transfer in the flash chamber, more rapid approach to equilibrium, and shorter metastable periods. (Davison-IPA)

Research conducted from January 20, 1958 to January 31, 1960 on direct solar distillation is reported. In this process saline water is evaporated from a basin or wick through solar radiation, and the vapor is condensed on some lower temperature surface of the still. A solar distillation research station was established in Northern Florida, where three basin-type solar stills were constructed and evaluated. Life tests of various plastic films were started during the research period. The research station and the stills are described. Performance data obtained during still operation is presented in detail. Results of these performance tests show that the productivity of the basin-type stills was nearly entirely dependent upon the intensity of the solar radiation, and it was not affected appreciably by weather conditions. Two Du Pont air-supported plastic stills of 500 and 2300 sq ft were also constructed; they were operated for about a year. It was found that there was very little difference in the performance of either type of still when both were in good operating condition. The greatest single heat loss in the basin still is radiation from the basin water to the cover. An improved design for the deep-basin still using an asphalt base, concrete support beams and a glass cover would reduce construction costs and increase its life. (Davison-IPA)

EXPANDED GLASSY POLYMERS AND POLYELECTROLYTE COMPLEXES AS REVERSE OSMOSIS AND ION-SELECTIVE MEMBRANES,
Massachusetts Inst., of Tech., Cambridge.
R. F. Baddour, W. R. Vieth, A. S. Douglas, and A. S. Hoffman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-191 232, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 274, October 1967. 81 p, 30 fig, 4 tab, 27 ref, 2 append.

Descriptors: *Desalination, *Membranes, *Fabrication, *Materials, *Polymers, *Evaluation, *Materials testing, *Plastics, Reverse osmosis, Thin films, Technology, Permeability, Desalination apparatus, Electrolytes.

The development of methods for synthesizing new hydrophilic membrane materials such as, polyelectrolyte complexes, polyurethanes, and hydroxyethyl methacrylate (HEMA) membrane systems is discussed. The research goal was to develop new materials with higher water permeabilities and longer useable lifetimes than cellulose acetate (CA), while keeping the salt rejection capacities of CA. In an effort to improve the performance of cellulose nitrate and other existing membranes modifications were made in the template inclusion technique with and without selective post-annealing. The experimental procedure involved the preparation and evaluation of hyperfiltration systems; characterization techniques are discussed. Experimental results show that the permeability of a film to dissolved salts can be controlled by varying the membrane preparation conditions. Reduction of the salt permeability usually coincides with reduction of water flux through the membrane. Cellulose nitrate and HEMA showed salt rejections of 90% at low rates, with polyurethanes having only a slightly lower value. New techniques were developed to control the water flux and salt rejections for these three materials; technology to control the properties of a number of hydrophilic polymers is now available. Polyurethanes and HEMA, prepared as ultrathin films, are the most promising materials for use in reverse osmosis. (Davison-IPA)

THE POTENTIAL CONTRIBUTION OF DESALTING TO FUTURE WATER SUPPLY IN NEW MEXICO,
Southwest Research Inst., San Antonio, TX.
D. E. Morris, and W. L. Prehn, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-208 787, Price codes: A08 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 767, Int-OSW-RDPR-71-767, September 1971. 174 p, 29 fig, 100 tab, 79 ref, 7 append. 14-01-0001-2580.

Descriptors: *Desalination, *Desalination processes, *Water supply, *Water treatment, *Cities, *Feasibility, *Economics, *Desalination plants,

Distillation, Electrodialysis, Flash distillation, Freezing, Reverse osmosis, Vapor compression distillation, Longtube vertical distillation, Water quality, Water quality control, Desalination wastes, New Mexico.

In a statewide study of the technical and economic feasibility of desalting the five New Mexico communities, Artesia, Gallup, Moriarity, Tularosa, and Zuni Pueblo, were selected on the basis of deteriorating water quality in their present water supplies. All local conditions, topography, climate, water demand, sewage production, and existing plant, were considered in determining whether or not desalting could improve water quality under acceptable economic conditions. The various desalting processes were calculated with regard to the individual community characteristics, and the most applicable process was selected for each. Calculations were made for electrodialysis, reverse osmosis, vapor compression-vertical tube evaporator-multistage flash distillation, vacuum-freezing vapor compression, and ion exchange in several combinations. Complete system costs are reported on the basis of product water which includes feedwater production, the plant and appropriate pretreatment, brine disposal, and pipelines. The final product water quality parameters include: 500 ppm TDS maximum; 250 ppm sulfates maximum; and 100 ppm CaCO3 hardness maximum. It was assumed that part of the brine from the desalt plant would be mixed with the effluent discharged from existing sewage treatment plants. All criteria were used only for developing the costs which are presented. (Davison-IPA)

Continued work in the design of and experimentation with flat, tilted single effect and multiple effect solar stills is reported. Improvements in single effect solar stills were obtained by using the heat carried away in the overflow brine and regulating the flow rate of the feed water. Attempts to reuse the heat of condensation failed to increase the distillate yield. A 10 to 15% increase in water yield on sunny days resulted from the use of a heat exchanger tube to recover the heat carried away by the outflowing brine; larger increases occurred on cloudy or partly cloudy days. The use of solar radiation to operate a capillary flow rate governor led to automatic regulation at the feed water. It was found that an increase in temperature changes the fluidity of the feed water, and thus the feeding rate increases in proportion to solar radiation intensity. Electrical heating was used during the sunless colder months in tests of new large multiple effect stills. The results obtained with the use of aluminum sheets were comparable to those previously obtained with Mylar films. This new still was constructed with 7.9 sq ft evaporating plates. The construction and materials of construction for both types of stills are discussed, and diagrams of the stills are provided. (Davison-IPA)

AVAILABILITY OF GEOTHERMAL ENERGY FOR THE DEMINERALIZATION OF SALINE WATER,
Battelle Memorial Inst., Columbus, OH.
J. C. Bell, R. C. Crooks, W. T. Holser, G. F. Sachsel, and J. R. Williams.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-161 400, Price codes: A04 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 27, July 1959. 62 p, 5 fig, 17 tab, 51 ref, 5 append. 14-01-001-89.

Descriptors: *Desalination, *Geothermal studies, *Demineralization, *Estimated costs, Engineers estimates, Thermal conductivity, Thermal properties, Heat flow, Thermodynamics, Equilibrium, Electric power production, Evaporation, Separation techniques, Water treatment, Water purification, Saline water.

A literature survey, a theoretical analysis of heat flow into different hole configurations in the earth, and an engineering appraisal of the utilization of geothermal energy were used to evaluate the potential use of geothermal energy for the demineralization of saline water. The selected 'best' determinations of equilibrium heat flow in various regions, estimates of equilibrium heat flow, temperature gradients, and thermal conductivities of rocks, all determined from the literature, are tabulated. The geological factors contributing to increased heat flow in the earth include recent igneous activity, regional increases in radioactivity of the earth's crust, presence of mountain roots, and simultaneous uplift and erosion. Four basic hole configurations were studied: (1) a plane, (2) a sphere, (3) a horizontal hole, and (4) a vertical hole. The literature provided mathematical solutions for the first three, and an original solution for the vertical hole was derived in this study. A water loop which conveyed heat from the source to an expansion turbine for electric power generation or a multiple-effect evaporator comprised the system considered. Cost estimates for a salt water evaporation plant using geothermal energy with an average thermal gradient in a 20,000 ft vertical shaft in granite, 1 ft in diameter, were over $28/1000 gallons of fresh water. The cost of the hole represented about 75% of the total estimated investment. (Davison-IPA)

PRODUCING PERMANENTLY HYDROPHYLIC SURFACES ON PLASTIC FILMS FOR SOLAR STILLS,
Franklin Research Center, Philadelphia, PA.
R. A. Erb.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-161 064, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 29, September 1959. 30 p, 4 fig, 2 tab. 14-01-001-168.

Descriptors: *Solar stills, *Films, *Coatings, *Plastics, *Titanium, Testing, Evaluation, Condensation, Surfaces, Silicon, Wettability, Hydrolysis, Submergence, Research and development, Water treatment, Desalination, Desalination processes, Desalination apparatus, Separation techniques.

Two approaches were investigated in the effort to produce a permanent transplant hydrophilic surface on a variety of plastic films for solar still condensing surfaces. The first method involved the vacuum deposition of silicon monoxide on the surfaces; the second involved the chemical deposition of titanium dioxide on the surface by means of the hydrolysis of tetraalkyl orthortitanates. Both methods proved to be technically feasible, but due to its lower cost and its ready adaptability to large scale operation, titanium dioxide was the process of choice. In a study of the parameters of the titanium dioxide process with optimum alkyl titanate, solvent, relative humidity, and other variables were determined. The immersion durability of titanium dioxide coated polymers was studied, and after seven months immersion in distilled water no coating failure was apparent. A continuous dip-coating technique was performed satisfactorily on cellulose acetate 9.5 in wide and 100 ft long, and a large test was made on weatherable Mylar, 54 in wide. Cloudy areas formed because of high humidity. (Davison-IPA)

CONCENTRATION POLARIZATION IN REVERSE OSMOSIS DESALINATION WITH VARIABLE FLUX AND INCOMPLETE SALT REJECTION,
Massachusetts Inst. of Tech., Cambridge.
P. L. T. Brian.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-179 436, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 145, September 1965. 41 p, 7 fig, 4 ref, 1 append. 14-01-0001-295.

Descriptors: *Desalination, *Desalination processes, *Reverse osmosis, *Membrane processes, Equations, Computer programs, Permeability, Water treatment, Water analysis, Separation techniques, Water purification, Research and development.

The concentration polarization in a saline solution flowing in a two-dimensional channel between flat

arallel osmotic membranes is analyzed. A Fortran rogram is developed to solve the finite-difference quations derived from theoretical analysis. The ermeation flux falling off as the salt builds up at he membrane surface and the effect of incomplete alt rejection are examined. The results indicate hat comparison of these solutions with the solu- ions for a constant flux membrane operating at the ame average permeation flux show that the con- entration polarization is greater for the variable lux case near the channel entrance, and is lower ear the channel exit. A simple design procedure is ormed in which the constant flux solution can be sed to predict the effects of concentration polar- zation on the required pressure drop and on the roduct water salinity for a variable flux mem- ranes. THE MECHANISM OF DESALINATION BY REVERSE OSMOSIS,
Aerojet - General Corp., Azusa, CA.
B. Keilin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-166 395, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 117, 1964. 86 p, 17 fig, 22 tab, 22 ref. 14-01-0001-338.

Descriptors: *Desalination, *Desalination process- es, *Reverse osmosis, *Membrane processes, Mem- branes, Physical properties, Chemical properties, Fabrication, Mass transport, Bound water, Thin films, Plastics, Heat treatment, Moisture content, Research and development, Permeability, Perme- able membranes, Permselective membranes, Hy- dration, Ions, Additives, Separation techniques, Water treatment.

Certain aspects of the swelling of secondary cellu- ose acetate by membrane salts have been clarified n continuing research on the mechanism (s) of material transport across a reverse osmosis mem- brane. The completed membrane salt studies have yielded new data regarding various membrane fab- rication parameters. The depth of the active layer has been redetermined by gradual hydrolysis of the active layer to a non-salt-retaining cellulose struc- ture. The water contents of thin films, determined gravimetrically, prove that these films are less highly swollen than the bulk membranes. The bound water content of desalination membranes before and after heat and pressurization treatments vary in a similar manner to that of the total water content. That permeabilities of many inorganic salts vary inversely with the extent of hydration of the component ions has been interpreted in terms of the bound water requirement for solution of the various ions in the membrane. It was found that the permeabilities of many sterically similar com- pounds with different functional groups vary with the hydrogen-bonding capacities of the solute spe- cies. Salt-retention capacity of the desalination membrane was improved by the addition of small amounts of additives to the feed solution. Feed additive effectiveness appears to be related to the surfactant capacity of the solute species. After investigation it was determined that microbial de- composition was responsible for the decrease in membrane desalination properties occurring upon storage in saline solution, rather than hydrolysis due to the brine. SALT CONCENTRATION AT THE SURFACE OF TUBULAR REVERSE OSMOSIS MEMBRANES,
Massachusetts Inst. of Tech., Cambridge.
R. E. Fisher, T. K. Sherwood, and P. L. T. Brian.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-177 203, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 141, September 1965. 38 p, 7 fig, 3 tab, 9 ref. 14-01-0001-295.

Descriptors: *Desalination, *Desalination apparatus, *Membranes, *Salt build-up, *Reverse osmosis, *Membrane processes, Permselective membranes, Semipermeable membranes, Equations, Digital computers, Diffusion, Velocity, Flow, Separation techniques, Water treatment, Water purification.

In a preliminary analysis of salt build-up, the saline solution was assumed to contain a single salt with a diffusion coefficient independent of salt concentration. The system considered was assumed to be isothermal, the water flux was assumed constant over the entire surface of the cylindrical membrane, and free convection was neglected. The velocity field equations are combined with the salt diffusion equations to express the salt concentration field as a function of the tube diameter, tube length, axial saline water flow velocity and water flux through the membrane. The equations were solved in two phases with a digital computer. Phase I generated the eigenvalues; Phase II generated the radial eigenfunctions, the series constants, and the concentration field from the eigenvalues. It was found that the effect of the salt build-up on the water flux depends on the operating conditions, and to keep less than a two-fold build-up of the salt concentration at the membrane surface over the initial feed concentration, very small diameter tubes, very short channel lengths, or multiple pass operations are required at higher water fluxes. REVERSE OSMOSIS FOR WATER DESALINATION,
General Atomic Co., San Diego, CA.
H. K. Lonsdale, U. Merten, R. L. Riley, K. D. Vos, and J. C. Westmoreland.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 696, Price codes: A07 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 111, May 22, 1964. 149 p, 49 fig, 17 tab, 96 ref. 14-01-0001-250.

Descriptors: *Desalination, *Desalination process- es, *Reverse osmosis, *Membranes, *Fabrication, Laboratory testing, Materials testing, Plastics, Physical properties, Estimated costs, Water costs, Desalination plants, Desalination apparatus, Separation techniques, Water treatment, Water purification, Sea water, Brackish water, Boundary layers, Mass transfer.

The properties of semipermeable membranes were studied and phenomenological descriptions were derived of flow through such membranes and the liquid phases in contact with them. Preliminary considerations of some of the engineering problems related to the reverse osmosis process, and an initial attempt at developing optimization techniques for reverse osmosis plant design are also included. Experimental work on the boundary-layer effects in reverse osmosis, transport properties of cellulose acetate (CA) membranes, polyvinyl alcohol (PVA) membranes, the transport properties of cellophane and other alternative membrane materials is discussed. Results of experimental work to determine lifetime properties of cellulose acetate membranes indicate that these membranes, as they are now prepared, can be expected to have a life of several months in brackish waters, but their useful lifetime in concentrated sea water may be shorter. The theoretical treatment of boundary-layer effects gave a reasonable representation of the experimental data obtained with CA membranes. The results of an economic study made of the energy requirements and capital costs of proposed sea water conversion systems using reverse osmosis show that 30 to 50% of the cost of product water is accounted for by capitalization charges on the membrane separator. The estimated product water cost figure of $1.00/1000 gallons indicates that the development of more efficient membranes is not a prerequisite to the establishment of reverse osmosis as a desalination process competitive with existing systems. CHAMBER GEOMETRY IN MULTI-STAGE FLASH EVAPORATORS.
Weir Westgarth Ltd., London (England).
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 682, Price codes: A06 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 108, July 1964. 91 p, 34 fig, 3 tab, 4 ref, 5 append. 14-01-0001-262.

Descriptors: *Desalination, *Desalination process- es, *Desalination apparatus, *Flash distillation, Design data, Specifications, Equations, Volume, Shape, Temperature, Separation techniques, Water treatment, Water purification, Sea water, Reynolds number.

The importance of various parameters on the length of a typical stage in a multi-stage flash evaporator for sea water conversion was studied on a simulated flash chamber with an adjustable wall. Using a set of standard conditions chamber efficiency was found at different chamber lengths, and an optimum length for complete vaporization was established. Data obtained from the examination of each parameter over a range of variables were expressed in the form of efficiency curves vs chamber length; constant efficiency curves were plotted for a given parameter. An empirical equation, derived from the test data for a specified range of conditions, enables an estimate to be made of the minimum chamber length required for complete flash-off. Of all the variables studied, the brine flow had the greatest effect on the chamber length. It is concluded that: if flash chamber length is reduced for constant flashing conditions, the chamber efficiency remains constant at 100% until a critical point is reached; further length reductions result in a rapid drop in efficiency for small decreases in length; chamber length is directly proportional to stage temperature drop; the chamber length - temperature characteristic is a function of specific volume, inversely proportional to temperature; and the geometry of the interstage brine transfer and splash plate arrangement is of great importance when designing a flash chamber. FURTHER PROPERTIES OF HYDRATES AND HYDRATING AGENTS,
Syracuse Univ. Research Inst., NY.
A. J. Barduhn, N. Klausutis, R. W. Collette, and J. R. Kass.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 583, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 88, March 1964. 75 p, 10 fig, 19 tab, 26 ref. 14-01-001-177.

Descriptors: *Desalination, *Hydrates, *Hydrate processes, *Hydration, *Solubility, *Crystal growth, *Crystallization, Laboratory equipment, Calibration, Instrumentation, Measurement, Physical properties, Chemical properties, Physicochemical properties, Freezing.

New data on the solubilities of hydrating agents in water and salt solutions, two new phase diagrams on hydrate systems, and a description of work on crystal growth rates are presented. New data and calculations for the solubility of F-31 (CH2ClF) in salt solutions, F-31 in pure water, new solubility data on F-142b, and revised solubility data for F-21 are discussed. Detailed calculations on the effects of solubility on the heats of formation and composition of three hydrates are presented. The apparatus used to obtain data for the chlorine-water and chlorine-water NaCl systems was completed and tested by determining several points on the phase diagram for F-152a (CH3CHF2) and methyl chloride. Ice crystal growth research during the period was primarily directed toward refining the apparatus and its operation. The experimental work involved various methods for growing and positioning seed crystals in flowing sub-cooled water. (Davison-IPA)

THE INFLUENCE OF ACOUSTICAL VIBRATIONS ON CONVECTIVE HEAT TRANSFER TO LIQUIDS,
Bolt Beranek and Newman, Inc., Cambridge, MA.
R. M. Fand.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 584, Price codes: A04 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 89, March 1964. 49 p, 9 fig. 14-01-0001-246.

Descriptors: *Desalination, *Acoustics, *Vibrations, *Equipment, *Laboratory equipment, Frequency, Heat transfer, Convection, Cavitation, Sound waves, Pumps, Heat exchangers.

Research to determine the effectiveness of acoustical vibrations as a means to increase heat transfer across a solid-liquid interface is reported. An experimental apparatus was developed in the form of a closed loop of piping through which water is pumped, and into which instrumented test specimens in the form of circular cylinders can be inserted. Controlled and measured acoustical vibrations must be created at the location where the test cyclinders are inserted. Calculations estimating the required intensity of the acoustical vibrations are presented. The function and operation of each of the 14 experimental apparatuses are discussed. Experimental heat transfer data were obtained under the following conditions: (1) natural convection without sound; (2) natural convection with sound, in the absence of and in the presence of cavitation; (3) forced convection without sound; and (4) forced convection with sound, in the absence of and in the presence of cavitation. The data show that acoustically induced cavitation significantly increases the rate of heat transfer across a solid-liquid interface, and that acoustical vibrations in the absence of cavitation do not appreciably affect the rate of heat transfer from a heated surface to a liquid for sound intensities up to 0.3 watts/sq cm. EXPANDED GLASSY POLYMERS AS REVERSE OSMOSIS MEMBRANES,
Massachusetts Inst. of Tech., Cambridge.
R. F. Baddour, W. R. Vieth, and A. S. Douglas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-189 421, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 144, September 1965. 88 p, 14 fig, 6 tab, 78 ref, 7 append. 14-01-0001-316.

Descriptors: *Desalination, *Desalination processes, *Desalination apparatus, *Reverse osmosis, *Membranes, *Fabrication, Permselective membranes, Semipermeable membranes, Plastics, Water treatment, Separation techniques, Water purification, Research and development, Materials testing.

Completed research on water and ion flux through modified poly(ethylene glycol monomethacrylate), and research in progress on the salt inclusion method of membrane preparation and membrane preparation by solvent control are reported. An evaluation of existing theories on the mechanism of water transport in reverse osmosis membranes led to the hypothesis that the degree of cross linking and the hydroxyl group content of a polymer were of major importance in determining its semipermeability. A series of crosslinked reinforced membranes was prepared to test this hypothesis. These membranes, copolymers of ethylene glycol monomethacrylate (EGM), ethylmethacrylate (EM) and ethylene glycol dimethacrylate (EGD), were tested under high reverse osmosis pressure with a sodium chloride solution; water sorption tests were also conducted. The degree of salt rejection exhibited by these membranes rose as the membrane was more tightly crosslinked, then dropped off sharply. It is concluded that crosslinking has a great effect on water sorpition. One membrane, one mill thick, prepared by the salt inclusion method provided 97.8% salt rejection with a flux rate of 0.5 gal/sq ft-day. An increase in the water permeability is expected with films cast using non-solvents in the casting solution. The effects of composition and properties of the solvent mixture on the desalination and flow properties of these membranes are being studied. (Davison-IPA)

SURVEY OF MATERIALS BEHAVIOR IN MULTI-STAGE FLASH DISTILLATION PLANTS,
Little (Arthur D.), Inc., Cambridge, MA.
E. H. Newton, and J. D. Birkett.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-200 924, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 512, December 1969. 95 p, 10 fig, 9 tab, 23 ref, 2 append. 14-01-0001-956.

Descriptors: *Desalination, *Desalination plants, *Desalination processes, *Flash distillation, *Construction materials, *Evaluation, Tubes, Heat exchangers, Pumps, Structural members, Corrosion, Descaling, Repairing, Maintenance, Separation techniques, Water purification, Water purity, Water treatment.

The performance of all structural, heat transfer, and equipment materials utilized in 55 large multistage flash distillation plants is surveyed. Data on the frequency of repairs, repair techniques, causes for component failures, the effectiveness of ensuing remedial action, and details of feed water treatment are presented for the heat exchanger tubes, tube sheets and demisters, water boxes, pump casings and impellers, and flash chambers. To determine the relative corrosion resistance of tube alloys and the corrosivity of inlet waters, a corrosion measuring instrument, the Corrater, was used. Insufficient time spent at any one of the installations for thorough checking of the technique may have been responsible for the lack of correlation between the measurements obtained and the experience with the materials. The many and varied reasons for plant shut-down or decreased production included: scale removal-acid cleaning, general maintenance, intake structure maintenance, water box repair, tube plugging and replacement, temperature imbalance, imbalance in steam distribution between power plant and evaporator in dual purpose plants, and steam boiler problems in single purpose plants. The plants in the survey represented nearly every variety of large multi-stage flash distillation plants currently in operation around the world. (Davison-IPA)

RESEARCH AND DEVELOPMENT OF NEW POLYMER SYSTEMS FOR REVERSE OSMOSIS MEMBRANES,
Aerojet-General Corp., Azusa, CA.
C. W. Saltonstall, Jr., W. S. Higley, and R. E. Kesting.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-176 354, Price codes: A04 in paper copy, A01 in microfiche. OSW Research and Deveopment Progress Report No. 167, February 1966. 43 p, 10 fig, 6 tab. 14-01-0001-435.

Descriptors: *Desalination, *Desalination apparatus, *Membranes, *Reverse osmosis, *Desalination processes, *Plastics permeability, Permselective membranes, Semipermeable membranes, Mass transfer, Fabrication, Films, Chemical properties, Physical properties, Water treatment, Separation techniques, Water purification.

Polyacrylonitrile (PAN), polymethacrylonitrile, and poly (vinylene carbonate) were selected in a program for developing reverse osmosis membranes with osmotic and mechanical properties and chemical stability superior to those of cellulose acetate membranes. These polymers were synthesized, and the membranes prepared from each exhibited semipermeable properties in reverse osmosis tests. PAN, selected because of its crystallinity and the high polarity of the nitrile group, was prepared with dimethylformanide (DMF) as the casting solution and heat treated in water. The membranes had fluxes of 16.5 to 21.0 gal/sq ft-day and salt retentions of 10 to 29% at 1500 psi when tested with a 3.5% sodium solution. The application of polymethacrylonitrile to the preparation membranes was carried out because of its solubili in low-boiling solvents and its chemical similari to polyacrylonitrile. Membranes prepared from very-high-molecular-weight polymer had an ave age flux of 21.5 gfd and average salt retention 10%. The poly (vinylene carbonate) membran obtained exhibited salt retentions as high as 83% low flux rates when tested at 1500 psi with 3.5 sodium chloride solution. Decreased salt retentio resulted when preparation conditions were alter to provide high fluxes. A comparison and evalu tion of poly (vinylene carbonate) membranes wi cellulose acetate membranes showed that salt r tention expected from poly (vinylene carbonat was one-third of that achieved with cellulose ac tate at equivalent fluxes. (Davison-IPA)

REVERSE OSMOSIS FOR WATER DESALINA TION,
General Atomic Co., San Diego, CA.
H. K. Lonsdale, U. Merten, R. L. Riley, and K. D. Vos.
Available from the National Technical Informatio Service, Springfield, VA 22161 as PB-177 079 Price codes: A05 in paper copy, A01 in microfiche OSW Research and Development Progress Repor No 150, October 1965. 88 p, 37 fig, 16 tab, 43 ref 14-01-0001-250.

Descriptors: *Desalination, *Desalination apparatus, *Membranes, *Reverse osmosis, *Fabrication, Laboratory testing, Plastics, Polymers, Deterioration, Mass transport, Transport depletion, Hydrolysis, Separation techniques, Water treatment, Water purification.

Research emphasizing lifetime studies of cellulose acetate membranes, and investigations of alternative membrane materials are reported. Although lifetime studies of cellulose acetate membranes show that the deterioration in salt rejection commonly observed in reverse osmosis systems can be controlled, the problems of marginal salt rejection and marginal flow rates after extended periods of use remain. Life test results performed on cellulose acetate membranes and evidence relating some of the observed time-dependent effects to hydrolysis of the acetate are presented. A study of the hydrolysis reaction is reported, and the quantitative relationship between hydrolysis and membrane deterioration rate is examined. The theoretical approach to membrane permeability emphasizes those aspects important in the preliminary evaluation of membrane materials. Results obtained from transport studies of cellulose acetate membranes

are presented. Studies crosslinking polyvinylpyrrolidone (PVP) are discussed. It was found that crosslinking with MDI was an effective method of insolubilizing PVP and obtaining membranes with desired water content. The potential new membrane materials investigated included nylon, polyvinyl butyral, cellulose acetates with higher acetyl content, cellulose butyrates, oxidized cellulose acetate, and other hydrophilic materials. Although nylon looks promising in terms of permeability and salt rejection, it looses its favorable physical properties as it becomes more hydrophilic. (Davison-IPA)

POLYELECTROLYTE COMPLEXES AS REVERSE OSMOSIS AND ION-SELECTIVE MEMBRANES,
Massachusetts Inst. of Tech., Cambridge.
A. S. Michaels, H. J. Bixler, R. W. Hausslein, and S. M. Fleming.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-177 078, Price codes: A05 in paper copy, A01 in microfiche OSW Research and Development Progress Report No 149, December 1965. 90 p, 30 fig, 3 tab, 28 ref. 14-01-0001-315.

Descriptors: *Desalination, *Desalination processes, *Reverse osmosis, *Membranes, *Fabrication, Desalination apparatus, Polymers, Plastics, Mass transfer, Aqueous solutions, Solvents, Separation techniques, Water treatment, Water purification.

A brief discussion of research completed on polysalt complex membranes and transport mechanisms in cellulose acetate membranes is followed by a report of the detailed investigation being carried out on polysalt complex membranes. A preliminary investigation revealed that polysalt complexes are potentially superior desalination membrane materials, but the lack of very efficienct consolidation techniques is a major obstacle in their development. Results of the investigation of transport mechanisms in cellulose acetate reverse osmosis membranes indicate that the high desalination efficiency of these membranes is mostly due to the high concentration and high diffusivity of water in the polymer, and the low concentration and low diffusivity of ionic solutes. Polysalt complex membranes prepared by casting from polysalt complex-ternary water solutions, a water-miscible organic solvent, and a strong electrolyte were tested with 4% aqueous sodium chloride solutions at 1500 psi. The most successful membrane preparation procedures involved casting a 10 mil thickness of 18% polysalt in water, dioxane, HCl ternary, gelling in an oven at 50C for 25 minutes, and washing in water at room temperature. These membranes exhibit salt rejections of 50% and water fluxes of 2 gal-mil/sq ft-day. Other preparation methods such as the use of the hydrobromic acid-methyl cellusolve solvent system are being studied. Correlation of the reverse osmosis data with the water content of the membrane was made. (Davison-IPA)

INVENTORY OF PUBLISHED AND UNPUBLISHED DATA ON THE CHARACTERISTICS OF SALINE SURFACE AND GROUND WATERS OF SOUTH DAKOTA,
South Dakota School of Mines and Technology, Rapid City. Engineering and Mining Experiment Station.
E. H. Tullis, J. P. Gries, and J. H. Cope.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-161 381, Price codes: A08 in paper copy, A01 in microfiche. Final Report, June 1954. 154 p, 8 fig, 2 tab, 19 ref. 14-01-001-56.

Descriptors: *Data collections, *Saline water, *South Dakota, Surface waters, Groundwater, Watersheds(Basins), Publications, Drilling, Testing.

A compilation of data collected from literature on saline water analysis in South Dakota is presented. After a geological discussion of the groundwater of this area data on the analysis of both surface and groundwater are tabulated, and referenced with the appropriate bibliographic reference number. All analyses are sequentially numbered and locations for them are given on record sheets. An index of the analyses pertaining to the drainage basins of surface waters is included. Available information on 31 drill stem tests run on deep oil and water is tabulated. The extensive bibliography includes both published and unpublished sources. (Davison-IPA)

COST STUDIES OF LARGE MULTI-STAGE FLASH SALINE WATER CONVERSION PLANTS.
Bechtel Corp., San Francisco, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-166 254, Price codes: A17 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 116, October 1964. 279 p, 43 fig, 25 tab, 13 ref, 2 append. 14-01-0001-313.

Descriptors: *Desalination, *Desalination plants, *Desalination processes, *Multi-stage flash evaporation, *Design criteria, *Estimated costs, Capital costs, Water costs, Construction, Construction materials, Concretes, Cost analysis, Heat balance, Temperature, Saline water, Separation techniques, Water treatment, Water purification.

A study was undertaken to determine the cost reductions of converting sea water to fresh water resulting from increasing the scale of operations, and using exhaust steam from a gas-fueled power generating station as a heat supply for the conversion plant. Seven specific cases of the multi-stage flash evaporation process were selected, and the entire study was based on a common set of site and design criteria. Results of a preliminary study indicate that coated concrete could be used for construction of evaporators for temperatures up to 250F. After work was under way, optimized evaporator designs and capital estimates of water conversion facilities were developed for 16 cases with the following ranges of steam costs and brine and sea water temperatures: steam costs of 5, 15, 25, and 35 cents/M lbs; brine temperatures of 250F and 300F; and sea water temperatures of 65F and 85F. A computer program was developed to solve the heat and material balances of the process scheme. Capital cost estimates were developed and tabulated so that the cost of water could be computed for each of these cases. Optimum plant configurations and the capital cost estimates are tabulated. A general description of the water plant and power plant are presented, and the discussion of specific plants includes equipment lists, data on the heat and material balances, and the opimum computer run. Drawings of the specific plants are provided. (Davison-IPA)

WEYERHAEUSER'S RAISING SALMON -- USES MILL COOLING WATER AT HATCHERY,
P. I. Meadors.
Pulp and Paper, Vol. 42, No. 12, p 148-149, November, 1978. 1 fig, 3 illus.

Descriptors: *Cooling water, *Pulp and paper industry, *Water reuse, *Fish hatcheries, Wastes, Industrial wastes, Water pollution sources, Effluents, Oregon, Salmon, Chinook salmon, Coho salmon, Chum salmon, Fisheries, Fish, Aquatic animals.

Hot water (7,000,000 gal/day) from the cooling system at Weyerhaeuser Co.'s linerboard mill (Springfield, Oregon) is piped 2.25 miles to the $7,000,000 salmon hatchery. This water is combined with river water to maintain a temperature of 55F, thus reducing the rearing time for chinook, chum, and coho salmon from 18 to 6 months. (Swichtenburg-IPC)

A method for processing paper mill white water involves adding sulfuric acid to reduce the pH below 4, mixing thoroughly, adding calcium hydroxide to raise the pH to above 10, and separating the coagulated solids so formed. The clarified water can be recycled (after neutralizing) as a major source of water for the papermaking process; the coagulated solids can be used as landfill, as a low-grade pulp source, or as fuel. 3E. Conservation In Industry

SOME ASPECTS OF PROPER WATER MANAGEMENT IN PAPER MILLS (NIEKTORE ASPEKTY RACJONALNEGO KSZTALTOWANIA WODNO-MASOWYCH OBIEKTOW PAPIERNI),
Instytut Celulozowo-Papierniczy, Lodz (Poland).
A. Kowalczyk.
Przeglad Papierniczy, Vol. 34, No. 8, p 301-305, August, 1978. 7 fig, 18 ref, 1 tab.

Descriptors: *Water conservation, *Pulp and paper industry, Industrial water, Recycling, Water pollution sources, Pulp wastes, Water reuse, Closed systems, White water(Paper machines), Effluents, Capital costs, Costs, Water pollution control, Paper machines, Savealls.

Ways to reduce fresh water consumption in paper mills are discussed, including increasing the consistency of the stock supplied to the mill, reducing the amount of fresh water supplied directly to the paper machine (for showers, seal water, etc.), sepa-

rating white water from other wastes before treatment, proper selection and mounting of savealls, coordinating water circuits on the paper machine and the mill as a whole, and controlling water circuits on the machine with flow meters and consistency meters. The first step in a water management program should be reduction of fresh water consumption to 25-40 cu m/ton of paper through modernization and modification of the paper machine water circuit, including partial water recycling. Such reduction is relatively easy to achieve at low investment costs and is free of problems experienced in mills with a closed water cycle. (Stapinski-IPC)

CONSIDERATIONS IN PROCESS WATER REUSE IN NON-INTEGRATED PAPER MANUFACTURING,
Miami Univ., Oxford, OH.
A. M. Springer.
Paperi ja Puu, Vol. 60, No. 11, p 705-706, 709-712, 715-716, November, 1978. 7 fig, 11 ref, 3 tab.

Descriptors: *Paper mills, *Water conservation, *Water pollution control, Model studies, Pulp and paper industry, Effluents, Water pollution sources, Water reuse, Economics, Costs, Recycling, Industrial water, Suspended solids, Dissolved solids, Closed systems, Fine papers, White water(Paper machines).

A model fine-paper mill is analyzed for possible elimination of effluent discharge. Potential economic benefits from water, fiber, filler, and energy savings amount to $7.70/1000/kg (or $7.00/U.S. ton) for this model, and these savings must offset the cost of process modifications. A set of possible modifications to achieve total water recirculation is presented. Problems which may arise from water-conservation efforts include felt and wire plugging, corrosion, scale deposits, foaming, slime and odor formation, nonuniform sizing degree and paper color, and other difficulties affiliated with buildups of suspended solids and/or dissolved solids in the closed water circuit. These problems may prevent total system closure in practice. A steady-state mass balance calculation indicates a rapid acceleration of dissolved-solids accumulation in the white water at effluent levels below 12.5 cu m/1000 kg (3000 gal/ton) of paper produced. (Brown-IPC)

A REVIEW OF INDUSTRY EXPERIENCE WITH SELECTED INTERNAL PROCESS SOLIDS SEPARATION DEVICES,
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
J. E. McCourt.
NCASI Stream Improvement Technical Bulletin, No. 314, 57 p, August, 1978. 2 appendices, 73 ref, 5 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *White water(Paper machines), Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Water pollution sources, Pulp and paper industry, Effluents, Water reuse, Separation techniques, Recycling, Industrial water, Equipment, Savealls, Filters, Screens, Water conservation.

A survey is presented of the capabilities of equipment used in white water reuse schemes, namely, pre-saveall devices, savealls (drum, disk, or flotation), and in-line strainers/filters. This review focuses on the use, role, and importance of post-saveall devices in providing white water of uniform quality, hence enhancing the possibility for continuity of operation and more extensive water reuse in the papermaking process. Reported experiences with post-saveall solids removal devices are described, namely, fine-screen fractionators (A. B. Floatwash and Celleco microsorter), sidehill screen derivatives (DSM screen), centrifugal fine screens (SWECO, CSC), and microstrainer units (North filter, Sinclair rotary filter). More detailed knowledge is needed of the capability and feed water quality. This information may be obtained in well designed field studies at existing installations by incorporating continuous flow measurements and on-line continuous suspended solids measurements at currently successful solids removal systems preceding machine showers. Such a study also lends itself to pilot trials of an array of available devices. (Swichtenberg-IPC)

EFFECTS OF MECHANICAL AGITATION ON DRYING RATE OF FINE-GRAINED DREDGED MATERIAL,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Environmental Effects Lab.
T. A. Haliburton, G. N. Durham, K. W. Brown, R. E. Peters, and T. B. Delaney, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A044 843, Price codes: A07 in paper copy, A01 in microfiche. Technical Report D-77-10. September 1977. 121 p, 54 fig, 13 tab, 74 ref, 3 append.

Descriptors: *Dredging, *Slurries, *Dewatering, *Mixing, *Evaporation, Evaporation control, Evaporation pans, Sludge treatment, Surface drainage, Landfills, Waste disposal.

An evaluation of methods for the evaporative dewatering of fine-grained dredged material slurry compared continuous agitation at controlled sites during periods of high and low evaporative demand and periodic agitation to desiccate the crust. A theoretical analysis of the factors controlling evaporation of soil slurries was performed prior to field tests. Fine-grained dredged slurries were treated: in a small-scale controlled agitation experiment under conditions of low evaporative demand; in a large-scale controlled agitation experiment under high evaporative demand conditions; and in a six-month field demonstration of periodically mixing the surface desiccation crust and underlying highly moist dredged materials. Results of the study indicated that agitation of highly plastic clay slurries does not significantly influence the rate of evaporative water loss or slurry volume reduction compared to unagitated samples. The surface area of the shrinkage cracks provided additional evaporation which offset any decrease in the rate of evaporative drying. The standard Class A Pan Evaporation procedure can approximate the maximum rate of evaporation in highly plastic clay slurries; the duration of these rates are dependent upon soil properties, initial water content, water table location, and climatic conditions. Periodic mixing can improve material subsidence, but improving surface drainage and removing water rapidly were considered better alternatives in confined disposal areas. (Lisk-FIRL)

P. J. Lorens.
Pacific Groundwater Digest, Vol 2, No 2, p 8-12, February, 1979. 3 fig, 1 tab, 4 ref.

Descriptors: *Ground water basins, *Geohydrologic units, Irrigation wells, Withdrawal, Conjunctive use, Storage, Specific yield, Drillers logs, Water level, California, Sacramento Valley.

The ground water basin underlying the Sacramento Valley is second largest in California. It stores as much water as all the surface reservoirs in the state combined. There is a wide variation in ground water quantity and quality both between and within the geologic formations composing the basin. The use of ground water for irrigation in the valley has been steadily increasing since the early 1900's. By 1950 a pumping depression developed in Solana County due to increased ground water withdrawals. However, in recent years, ground water levels have been rising due to greater use of imported surface water. The largest pumping depression is in Sacramento County, the result of many years of pumping. With conjunctive-use management, ground water would be used during dry periods, and during the wet season, the basin would be recharged by percolation of streamflow, infiltration of unused irrigation water, and precipitation. The total volume of ground water in storage in the Sacramento Valley was estimated at 113,700,000 acre-feet for 1965 water level conditions in a depth zone ranging from 20 to 600 feet from the ground surface. This estimate was based on assigning specific yield values to materials described in driller's logs. (Purdin-NWWA)

NUMERICAL MODELLING OF AN AQUIFER SYSTEM WITH INTERMITTENT RECHARGE,
James Cook Univ., North Queensland (Australia). Dept. of Civil Engineering.
R. E. Volker.
Australian Water Resources Council Technical Paper No 25, 1977, 64 p, 26 fig, 47 ref.

Descriptors: *Digital computers, *Model studies, *Aquifers, Coasts, Groundwater recharge, Artificial recharge, Discharge(Water), Water levels, Saline water intrusion, Water management(Applied).

A digital model is presented which will evaluate the quantity and quality of groundwater from the Burdekin Delta on the North Queensland coast. The model takes into account both natural and artificial recharge conditions and the saline water-freshwater interface near the cost in predicting water levels at any particular time under the influence of given recharge or pumping rates. Results from the model indicate that average water levels in the last ten years would have been considerably lower if artificial recharge had not been carried out. One requirement of the model is a reliable method for determining recharge or discharge under assumed or actual climatic conditions. Also, needed are accurate field data from which recharge and discharge can be estimated. Models which determine seawater intrusion are also described and some results obtained from them are presented. Short term lowering of water levels will not result in significant intrusion. Descriptors: *Groundwater resources, *Evaluation, *Regional analysis, *Gulf Coastal Plain, Groundwater availability, Water quality, Water wells, Water yield, Aquifers, Water utilization, Water supply, Water demand, Water level fluctuations, Groundwater recharge, Surface-groundwater relationships, Saline water intrusion, Desalination, Aquifer management, Water conservation, Groundwater potential, *Lower Mississippi River basin.

The Lower Mississippi Region, and area of 102,400 square miles, lies mostly in the Gulf Coastal Plain physiographic province. Three small areas on the northwest boundary are in the Interior Highlands. An abundance of fresh ground water is available in the region--about 844 billion cubic feet annually. Only about one-third of this available supply is being used. The largest use of ground water in the region is for irrigation. Saltwater occurs throughout the region in the lower limits of the aquifers. The quantity of saltwater available is several times that of freshwater. As desalination techniques are perfected, and as more uses are found for saltwater, it will become an increasingly valuable resource. Water-resource development and related activities should include adequate consideration of ground water. Also, activities such as large-scale construction and mining excavations should be well planned and their impact upon the groundwater regime carefully evaluated. (Woodard-USGS)

Descriptors: *Urban hydrology, *Storm runoff, *Rainfall-runoff relationships, *Flood profiles, *Hydrologic data, Urban runoff, Streamflow, Hydrographs, Mass curves, Texas, *Dallas area.

This report contains rainfall and runoff data collected during the 1976 water year for drainage basins of Joes Creek, Bachman Branch, Turtle Creek, Coombs Creek, Cedar Creek, White Rock Creek, Elam Creek, Fivemile Creek, Newton Creek, Whites Branch, Prairie Creek, Tenmile Creek, Duck Creek, and South Mesquite Creek in the Dallas metropolitan area. The information will be useful in determining the extent to which progressive urbanization will affect the yield and mode of occurrence of storm runoff. Detailed rainfall-runoff computations, including hydrographs and mass curves, are presented for six storm periods during the 1976 water year. During the 1976 water year, one continuous stream-gaging station and two flood-hydrograph partial-record stations were added to the study area. These stations are located in the Prairie Creek basin. Descriptors: *Watersheds(Basins), *Watershed management, *Fort Carson(CO), *Military reservations, *Soil erosion, *Watershed Erosion Index, *Environmental effects, *Military training areas, *Small watersheds, Baseline studies, Colorado, Resource management, Topsoil, Soil types, Rocky Mountain Region, Rainfall, Topography, Methodology, Analytical techniques, Sediments, Sedimentation, Land use, Universal Soil Loss Equation, Mathematical studies, Equations, Forecasting, Soil conservation, Mapping, Slopes.

The Watershed Erosion Index (WEI) was developed to predict average annual sediment yield for watersheds on Fort Carson military reservation, Colorado, two-thirds of which is intensively used for mechanical army infantry training. Training activities have seriously damaged trees and grass cover in this semiarid, fragile ecosystem. WEI, a modified version of the Universal Soil-Loss Equation, provides reliable engineering data in designing soil conservation measures. Soil losses in the six study watersheds were not significantly different from those of other small watersheds in the Rocky Mountain foothills region, but over most of Fort Carson the annual topsoil formation rate is probably less than the annual soil-loss rate because of: (1) the relatively slow rate of natural revegetation and vegetative growth due to low annual precipitation, (2) exposure of large training areas to wind erosion, and (3) the frequency and intensity of troop training. Recommendations: (1) further validate the methodology, (2) develop a computer program to calculate average annual sediment yield, (3) estimate effective life of other basins at Fort Carson that are silting in at a rapid rate, and (4) determine basin capacity required for sediment retention in all future engineering design studies for new construction at Fort Carson. Data requirements for WEI use include rainfall, soil erodibility, slope-length and gradient, and composite land use factors, and the percent of the watershed occupied by the field mapping unit. METHODS TO CONTROL FINE-GRAINED SEDIMENTS RESULTING FROM CONSTRUCTION ACTIVITY,
Hittman Associates, Inc., Columbia, MD.
M. A. Nawrocki, and J. M. Pietrzak.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 092, Price codes: A05 in paper copy, A01 in microfiche. Report No. EPA 440/9-76-026, December 1976. 83 p, 11 fig, 11 tab, 39 ref, 1 append. 68-01-3260.

Descriptors: *Sediment control, *Construction, *Pollution abatement, Water pollution control, Erosion control, Particle size, Technology, Sediment transport, Suspended solids, Retention, Storage.

The most promising control alternatives for increasing the amount of fine-grained sediment retained at a construction site are summarized from current technology as described in literature. Use of a specific technique or combination of techniques depends upon the degree of fine-grained sediment control required and the characteristics of the soils at the site. The four general categories for the control of fine-grained sediment closely follow the implementation of a standard erosion and sediment control plan. The first category consists of standard techniques used on construction sites which tend to reduce the production of sediment at the site. The second category involves the use of adequate control measures including sediment traps, sediment filters and baffles, and sediment ponds to retain the fine-grained sediment on site. The third category involves the installation of mechanical separation devices capable of removing fine-grained particles from water at the overflow structure of the retention ponds. The last technology includes the removal, dewatering, drying, and perhaps, the use of the sedimentary materials. It is concluded that: overall control of fine-grained sediments can be achieved by modification and expansion of a standard erosion and sediment control plan; fences constructed of plastic filter cloth

appear to be one of the most effective control devices; and modifications of detention ponds including the installation of baffles and the provision of a more effective length to width ratio will achieve more removal of these sediments. (Davison-IPA)

PLANTING GUIDELINES FOR MARSH DEVELOPMENT AND BANK STABILIZATION,
Coastal Engineering Research Center, Fort Belvoir, VA.
P. L. Knutson.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A046 547, Price codes: A02 in paper copy, A01 in microfiche. Report CETA-77-3, 1977. 21 p, 3 fig, 2 tab, 9 ref, 3 append.

Descriptors: Erosion control, *Bank stability, Soil stabilization, *Marsh management, *Vegetation establishment, Marshes, *Marsh plants, Labor, *Planting management, Seeds, Fertilization.

Guidelines are presented for the use of marsh plants in stabilizing eroding banks and for marsh development. The selection of plants and planting methods and the determination of seed application rate and plant spacing are discussed. Determination of fertilization requirements and estimation of labor for planting on a project-by-project basis, are also discussed. Four types of cordgrass are considered including Smooth, Gulf Coast, California, and Saltmeadow. This report supplements Chapter 6 of the Shore Protection Manual of the US Army Corps of Engineers (1975). (Small-FIRL)

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

NITRATE ANALYZER MONITORS AILING WELL,
Garden City Park Water District, NY.
M. R. Sheinker, and R. Krumholz.
Water and Wastes Engineering, Vol 16, No 2, p 37-38, February, 1979, 2 fig.

Descriptors: *Nitrates, *Water quality control, *Monitoring, Ion exchange, Ground water, Denitrification, Human diseases.

Because of the strong correlation between high nitrate content in drinking water and the disease, methemoglobinemia, government regulations require continuous monitoring to see that the nitrate level does not exceed the 10 mg/l limit established as safe. The water treatment plant for Garden City Park, New York, uses a closed-loop ion exchange system to remove nitrates and an on-line Series 8138 S.I.E. analyzer to automatically and continuously measure the nitrate concentration of the denitrified product. The analyzer automatically shuts the system down if a level of 9.9 mg/l nitrate as nitrogen is detected or if a zero reading is recorded due to a reagent or analyzer failure. (Purdin-NWWA)

QUALITY ASSURANCE PROGRAM FOR TRACE HYDROCARBON ANALYSIS,
National Bureau of Standards, Washington, DC. Analytical Chemistry Div.
S. N. Chesler, H. S. Hertz, W. E. Wise, and S. A. Wise.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol VIII, Contaminant Baselines, p 1-10, October 1978. 3 tab, 6 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 01-6-022-11469.

Descriptors: *Laboratory tests, *Pollutant identification, *Oil pollution, Water pollution sources, Path of pollutants, Baseline studies, Environmental effects, Resources development, Water quality, Alaska, *Outer Continental Shelf, *Hydrocarbons, Quality control.

During the past year the National Bureau of Standards (NBS) has conducted an interlaboratory comparison study on samples of Mytilus homogenized by NBS and has acted as a consultant laboratory to other NOAA Principal Investigators involved in hydrocarbon analysis of marine waters, sediments and tissues. Results to date have shown that there is an urgent need for a strong quality assurance program within the Outer Continental Shelf plan. Since the chemical data reported to NOAA originates from several different laboratories, it is imperative that these data be uniform in quality so that there is a basis for comparability of the data. The experimental results of a sediment comparison study are summarized in tables and the methods used by each laboratory are also summarized in tabular form. (Sinha-OEIS)

IDENTIFICATION OF NATURAL AND ANTHROPOGENIC PETROLEUM SOURCES IN THE ALASKAN SHELF AREAS UTILIZING LOW MOLECULAR WEIGHT HYDROCARBONS,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
J. Cline, R. Feely, and A. Young.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol VIII, Contaminant Baselines, p 73-198, October 1978. 49 fig, 6 tab, 6 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Baseline studies, *Oil spills, *Pollutant identification, Path of pollutants, Water pollution sources, Resources development, Water pollution effects, Environmental effects, Alaska, *Outer Continental Shelf, *Hydrocarbons, Petrogenic hydrocarbons, Biogenic hydrocarbons.

The development of petroleum resources in the Alaskan OCS may result in the release of toxic hydrocarbons to the marine environment. Increases in the natural levels of petroleum-derived hydrocarbons are likely to occur from the normal activities associated with exploration, production and transportation of crude and refined products within the region. Thus, it is of environmental significance that baseline levels of both naturally occurring and petroleum-derived hydrocarbons be established prior to the development of fossil fuel resources in the area, and that attention be focused in the sources and residence times of these components. The principal concern surrounding the distributions, sources, and sinks of low molecular weight hydrocarbons (LMWH) is not their direct impact on biota, but rather their role as tracers of more toxic hydrocarbon fractions commonly found in crude oils. Of particular value is the use of LMWH to identify probably trajectories of the toxic dissolved fractions during a spill, well blowout, or pipeline rupture. Because some of the hydrocarbons common to petroleum are also manufactured by marine organisms, it becomes necessary to evaluate the normal background levels of hydrocarbons before an accurate assessment of anthropogenic input can be made. The overall objective is to provide the criteria for an early warning detection of petroleum-derived hydrocarbons and to establish the feasibility of using LMWH as dispersion tracers, particularly in reference to near-bottom and resuspension processes. ASSESSING NITROGEN CONTAMINATION BY USE OF DIFFERENTIAL TEMPERATURE CALCULATIONS,
Whiteley-Jacobsen and Associates, Seattle, WA.
A. H. Benedict, and A. LeSouf.
Water Research, Vol 12, No 12, p 1107-1112, 1978. 8 fig, 2 tab, 13 ref.

Descriptors: *Nitrogen, *Aisne River(France), *Water pollution effects, *Equations, *Nitrogenous oxygen demand, *Biochemical oxygen demand, Carbon, Oxygen, Anaerobic conditions, Oxygen depletion, Rivers, France, Methodology, Analytical techniques, Mathematical studies, Industrial wastes, Municipal wastes, Water pollution sources, Pulp wastes, Ammonia, Ammonium, Oxygen requirements.

Nitrogenous oxidation accounts for about 38% of total oxygen demand requirements in the lower Aisne River, a subtributary of the Seine River in northern France, according to a methodology which defines the relative influences of nitrogenous and carbonaceous oxygen requirements. The methodology is based on definition of relative differences between BOD and nitrogenous oxygen requirements under warm (19-23C) and cold (2-6C) temperature regimes in the Aisne. The Aisne in the study area received point load contaminants from four industries (including a large ammonia-based pulping operation), the town os Soissons, and the Vesle River which receives wastes from the city of Reims. Mean monthly ammonia loadings to the Aisne were similar in winter and summer. Differential net nitrogen conversion resulting from the combined effects of ammonification and nitrogenous oxidation decreased with increasing flow rate (decreasing hydraulic residence time). At a flow of five cu m/sec there was a differential net conversion of 4.49 mg ammonium/l, while at a flow rate of 60 cu m/sec differential net conversion was 0.64 mg ammonium/l. Available data did not permit evaluation of the direct effect of ammonification. Anaerobic conditions could be expected in the Aisne if reaeration and photosynthetic oxygenation did not offset the requirements calculated. The relative influence of nitrogenous and carbonaceous oxidation would vary if other temperature regimes were used. (Lynch-Wisconsin)

SOME PROBLEMS INVOLVED WITH SAMPLING GEOTHERMAL SOURCES,
Los Alamos Scientific Lab., NM.
A. K. Stoker, and W. D. Purtymun.
In: Proceedings of the First Workshop On Sampling Geothermal Effluents; Workshop held October 20-21, 1975, Las Vegas, Nevada. Report EPA-600/9-76-011, p 67-95, May 1976. 7 fig, 1 tab, 12 ref. ERDA W-7405-ENG36.

Descriptors: *Geothermal studies, *Thermal water, *Sampling, *Data collections, Methodology, Variability, Water vapor, Steam, Condensation, Analytical techniques, Chemicals, Carbon dioxide, Chlorides, Laboratory tests, Flow, Flow rates, Radioisotopes, Wells, Water wells, Groundwater.

Geothermal wells must be sampled for a variety of purposes, including geologic and geological interpretation, engineering design of facilities, environmental release evaluation, and documentation of baseline conditions. Basic factors influencing the choice and application of sampling methods were reviewed, including the type of the geothermal resource, the analyses of interest, well production parameters, utilization processes, and possible sample contamination or instability. Three basic methods of sampling were described: condensation, phase separation, and use of evacuated containers. Several practical problems experienced by various workers were discussed. The problems discussed included the natural variability of fluid composition with time, effects of well-bore heat losses, effects of well flow rate and production time, sampling locations, laboratory simulation studies, contamination by corrosion reactions, and documentation of hydrologic systems possibly connected to the geothermal resource. DRILL STEM TESTING AND SAMPLING OF GEO-PRESSURED BRINES,
Halliburton Services, Duncan, OK.
A. G. Edwards, and J. M. Montgomery.
In: Proceedings of the First Workshop On Sampling Geothermal Effluents; Workshop held October 20-21, 1975, Las Vegas, Nevada. Report EPA-600/9-76-011, p 97-113, May 1976. 5 fig, 6 ref.

Descriptors: *Geothermal studies, *Thermal water, *Drilling samples, *Pressure, Drilling, Wells, Sampling, Geology, Transmissivity, Groundwater, Brines, Equipment, On-site investigations, On-site data collections, Drill stem testing.

Technology and equipment are available today for obtaining samples and reservoir data on geo-pressured and most geothermal wells. The ultra-deep search for hydrocarbons has fostered development of subsurface equipment capable of withstanding pressure differentials of 10,000 psi at 500 F. This equipment has been used successfully in a limited number of geothermal wells, but the equipment has seen wide uses in the oil field. In addition to obtaining samples of the formation effluents, the following formation characteristics can be calculated: static reservoir pressure, indicated flow capacity, transmissibility, average effective permeability, damage ratio theoretical potential with damage removed, and the approximate radius of investigation. APPROACHES TO INTERPRETING ENVIRONMENTAL DATA,
Aerojet Nuclear Co., Idaho Falls, ID.
D. E. Michels.
In: Proceedings of the First Workshop On Sampling Geothermal Effluents; Workshop held October 20-21, 1975, Las Vegas, Nevada. Report EPA-600/9-76-011, p 204-217, May 1976. 2 fig, 7 ref.

Descriptors: *Sampling, *Monitoring, *Environment, *Pollutants, Thermal water, Geothermal studies, Spatial distribution, Temporal distribution, Distribution patterns, Path of pollutants, Water pollution, Air pollution, Variability, Analytical techniques, Data collections, Data processing.

In order to establish standard or reference procedures aimed at regulation of geothermal sources, it is necessary first to study the patterns involved. In this way, the standardized parts of a procedure can be well-aimed at particular features which geothermal sources have in common in their own patterns of behavior or patterns of dispersion of their effluents. Comparability must be one of the motives behind setting up standardized procedures. Not all components of individual patterns are equally useful in comparing one geothermal source with another. It is necessary to learn which features are important to the purpose, either academic or regulatory, and then to focus the standardization of sampling toward those features. The interpretation of geothermal data must begin before the samples are taken. (See also W79-06052) (Sims-ISWS)

RADIATIVE PROPERTY MEASUREMENTS FOR SELECTED WATER SUSPENSIONS,
Purdue Univ., Lafayette, IN. Heat Transfer Lab.
F. P. Incropera, and K. G. Privoznik.
Water Resources Research, Vol. 15, No. 1, p 85-89, February 1979. 8 fig, 20 ref. NSF ENG75-17370.

Descriptors: *Light, *Light penetration, *Bodies of water, *Optical properties, Radiation, Waste water, Algae, Opacity, Laboratory tests, Absorption, Suspended solids, Particle size, Water pollution, Water pollution effects, *Radiative properties, Light scattering, Light extinction.

Although transport of the visible component of solar radiation in a water body strongly influences thermal structure and the growth of photosynthetic organisms, little is known about the inherent radiative properties which govern this transport. These properties include the extinction, scattering, and absorption cross sections, as well as the scattering phase function. In this study, systematic property measurements were made for two special cases: the wastewater suspension and the symbiotic algal culture. In both cases, extinction is dominated by scattering processes (rather than by absorption), but cross sections associated with the symbiotic cultures are typically a factor of 6 larger than those associated with the wastewater. In both cases, the scattering phase function is strongly peaked in the forward direction. (Sims-ISWS)

SENSITIVE, SPECIFIC FLUORESCENCE IMMUNOASSAY METHODS FOR DETECTING PESTICIDES AND OTHER ORGANIC ENVIRONMENTAL CONTAMINANTS ARISING FROM BIOLOGICAL OR CHEMICAL SOURCES,
IRT Corp., San Diego, CA.
H. R. Lukens, C. B. Williams, S. A. Levison, and W. B. Dandliker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 031, Price codes: A05 in paper copy, A01 in microfiche. Final Report No. NSF/RA-770472, November 21, 1977. 94 p, 28 fig, 12 tab, 23 ref, 4 append. AEN 74-09725A01.

Descriptors: *Pesticides, *Pollutant identification, *Immunoassay, *Organic pesticides, Organic compounds, Diquat, Hexachlorophene, Diethylstilbesterol, Fluorescence, Analytical techniques, Environmental effects.

An immunoassay is described which has been successfully applied in detecting three contaminants of current concern: diquat, hexachlorophene, and diethylstilbesterol. The early stages of the development of a portable fluorescence polarimeter are described. The basic technique in the immunoassay involves the use of an antibody to the specific contaminant, followed by contaminant detection with fluorescence polarization or intensity measurements. The use of ionizing radiation for developing complex conjugate antigens is examined. Not previously reported, this technique significantly reduces the cost of producing these complex conjugates compared to conventional chemical synthesis techniques. (Davison-IPA)

BIOCHEMICAL OXYGEN DEMAND MEASURING DEVICE,
A. R. F. Products Inc., Raton, NM.
L. G. Stolarczyk.
United States Patent No. 4,105,523. Issued August 8, 1978, 9 p. 7 claims. 3 fig.

Descriptors: *Patents, *Biochemical oxygen demand, *Instrumentation, *Water analysis, Testing, Sampling, Water properties, Water pollution, Oxygen, Electrolysis.

The sample to be tested is placed in a sealed reaction chamber large enough to provide an air space above the sample. An oxygen generator including an electrolytic cell is placed in communication with the reaction chamber. The pressure in the air space in the chamber is sensed and the sensing is used to actuate a switch to supply electric current to the electrolytic cell. Operation of the cell supplies oxygen to the air space to replace that consumed by the sample, and the resultant rise in pressure deactivates the switch. The current is supplied in the form of uniform pulses; hence the number of pulses supplied to the cell is a measure of the oxygen produced by the cell as well as a measure of the BOD of the sample. (Lynch-IPC)

BOD TEST VARIABLES,
New Brunswick Dept. of Fisheries and Environment, Fredericton. Environment Div.
D. G. Morrissette, and D. S. Mavinic.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 104, No. EE6, p 1213-1222, December, 1978. 3 fig, 12 ref, 4 tab.

Descriptors: *Biochemical oxygen demand, *Water analysis, *Water pollution, Turbulence, Turbidity, Light, Mixing, Testing, On-site tests, Laboratory tests, Water pollution sources, Streams, Natural streams, Surface waters.

It has been reported that the oxidation rate in a natural stream is higher than the rate obtained from the corresponding laboratory BOD test. This study was undertaken to observe the effect of stream conditions, such as turbulence, light, and turbidity, separately and in combinations, on the BOD test, using raw domestic sewage. Mixing was found to increase the 5-day BOD by an average of 15%, while light increased the BOD by only 4%. Turbidity demonstrated an average reduction of about 24% on BOD values. Mixing and turbidity, in combination, reduced the BOD by 28%, turbidity and light by less than 6%, light and turbidity and mixing by 26%, while mixing and light increased the BOD by about 15%. Thus, extrapolation from laboratory to field conditions, from the existing standard BOD test, yields questionable results. Inclusion of the physical characteristics of the stream in the BOD test is a possible approach to obtaining more meaningful results. (Witt-IPC)

DIRECT AND INDIRECT IMMUNOFLUORESCENCE STAINING OF FECAL STREPTOCOCCI FOR RAPID ASSESSMENT OF WATER QUALITY,
Brookhaven National Lab., Upton, NY.
M. T. Pavlova, E. Beauvais, F. T. Brezenski, and

W. Litsky.
Available from the National Technical Information Service, Springfield, VA 22161 as BNL-23328, Price codes: A02 in paper copy, A01 in microfiche. Presented in part at the Third Conference of the Society of Applied Microbiology, Cairo, Egypt, November 4-9, 1975. 22 p, 6 tab, 13 ref.

Descriptors: *Analytical techniques, *Sewage bacteria, *Streptococcus, *Fluorescence, Water pollution, Waste water, Sewage, Laboratory tests, *Water quality.

An attempt was made to develop a rapid test for the identification of fecal streptococci using immunofluorescence (IF) techniques. Using direct and indirect staining methods with pooled conjugates, it was possible to obtain 81% and 96% positive IF reactions, respectively. All IF cross-reactions observed with non-fecal streptococci and staphylococci were eliminated by trypsinization of the smears prior to direct staining. Trypsinization of the smears did not eliminate all IF cross-reactions when indirect staining methods were used. The direct staining method was not as sensitive as the indirect staining method, but it was specific, rapid, simple, economical, and applicable for rapid identification of fecal streptococci. Using IF techniques, fecal streptococci was identified in water and sewage samples within 20 hr. Conventional biochemical and serological tests may take as long as 7 to 14 days. Thus, IF techniques could possibly be automated for use in continuous monitoring systems. (Small-FIRL)

CHRYSOTILE ASBESTOS DILUTION STUDIES,
Ontario Ministry of the Environment, Toronto.
R. B. Hunsinger, and K. J. Roberts.
Technical Report 66. 1977. 10 p, 2 tab, 3 ref. 1 append.

Descriptors: *Asbestos, *Suspended solids, Turbidity, *Polyelectrolytes, Measurement, *Analytical techniques.

The simple dilution of concentrated asbestos suspensions in various distilled water-river water mixtures was studied. Consistently accurate quantitative analysis of chrystotile asbestos particles in the water mixtures was not possible. Generally the counts made after dilution of the concentrated particles ranged from the anticipated concentration to one or two orders of magnitude below that concentration. No correlation was found between the turbidity of the dilution water used and the resultant asbestos counts. The addition of polyelectrolytes to effect peptization prior to dilution led to more consistent asbestos counts after dilution. The use of peptization for the preservation of samples stored for asbestos analysis should be explored. (Small-Firl)

MODELING WATER QUALITY IN RIVER BASINS,
Kharkov Vodokanalniiproekt Inst. (USSR).
Ye. V. Yeremenko.
In: American Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Kharkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 55-89, September 1978. EPA-600/9-78-024. 11 fig, 17 ref.

Descriptors: *Water quality, *River basins, *Mathematical models, *Pollutants, *Evaluation, *Management, Channels, Algorithms, Hydraulics, Equations, Systems analysis, Diffusion zone, Three-dimensional problems, One-dimensional problems.

The appropriateness of specific waters for particular uses is determined by the combination of physical, chemical, and biologic criteria. However, current mathematical models of water quality use mainly physical criteria. The bases for mathematical models are hydrodynamic or hydraulic equations, and the turbulent diffusion equations for calculating pollutant concentrations with some allowance for nonconservative properties. Depending on whether the size of a river basin section or the whole river basin is considered, different data needs on pollutant concentration in the river are required. If a long stretch of watercourse is considered, it is expedient to use one-dimensional solutions; otherwise a two- or three-dimensional solution should be utilized. The zone within which the pollutant concentration is not completely mixed in the cross-section is called the three-dimensional diffusion zone. Considered is the calculation of the pollutant concentration in this zone. Discussed also are the evaluation of pollution concentration in one-dimensional problems and the solution of some problems of water quality management. (See also W79-06166) (Bell-Graf--Cornell)

MANAGEMENT DECISIONS FOR LAKE SYSTEMS BASED ON A SURVEY OF TROPHIC STATUS, LIMITING NUTRIENTS, AND NUTRIENT LOADINGS,
Corvallis Environmental Research Lab., OR.
A. F. Bartsch, and J. H. Gakstatter.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Karkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 372-394 (Discussion p 395-396), September 1978. 9 fig, 3 tab, 20 ref. EPA-600/9-78-024.

Descriptors: *Lakes, *Management, *Trophic level, *Model studies, *Nutrients, Decision making, Surveys, Eutrophication, Water quality, Reservoirs, Phosphorus, Northeast US, Watersheds(Basins), Algal assay, Vollenweider model, Ontario(Can).

The broad objectives of the National Eutrophication Survey, started in 1972 by EPA, were to identify lakes and reservoirs which receive effluents from municipal sewage treatment facilities and to determine the significance of these point-source nutrient inputs through field investigation. These goals have since been modified to include the relationships between drainage area characteristics and nutrient runoff to develop water quality criteria for nutrients. 812 water bodies distributed across the country were selected for a continuing study. For each lake, information has been sought for making management decisions for control of point and nonpoint sources of phosphorus and other nutrients. The existing trophic conditions were evaluated by sampling and an algal assay was performed to determine whether or not phosphorus, nitrogen, or other elements limited the productivity of the system; used where UH-1H Bell helicopters. Herein, three general models from the literature have been presented which relate total phosphorus to lake response. (See also W79-06166) (Bell Graf-Cornell)

DESCRIPTIVE SIMULATION MODEL FOR FORECASTING THE CONDITION OF A WATER ECOSYSTEM,
Scientific Research Institute of Engineering and Applied Mathematics, Rostov-na-Donu (USSR).
A. B. Gorstko.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Karkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 433--439 (Discussion p 440-441), September 1978. 2 fig. EPA-600/9-78-024.

Descriptors: *Ecosystems, *Water quality, *Simulation analysis, *Model studies, *Azov Sea(USSR), Effects, Computers, Biomass, Algorithms, Forecasting, Equations, Systems analysis.

Sophisticated computers are needed to forecast effects of human activity on aqueous ecological systems. Development of a mathematical model depends upon information available on processes occurring within the ecosystem being studied; model selection is based on the volume of accumulated information. For unique water bodies where the ecosystem has been studied for dozens of years the best model is the so-called descriptive simulation system. Any acceptable model for forecasting must fulfill five requirements. As an example, the simulation model of the Azov Sea, developed at the Scientific Research Institute of Mechanics and Applied Mathematics, is described herein. The Azov Sea is subdivided into seven segments; the ecosystem in each segment is described by a state vector, the components of which are concentrations of different substances in water and the biomass of specific animals and plants. The most acceptable verification and model refinement can be achieved by testing the algorithm with real data. The basic concepts herein will be used to simulate Lake Baikal. (See also W79-06166) (Bell-Graf-Cornell)

MATHEMATICAL ECOSYSTEM MODELS AND DESCRIPTION OF THE WATER QUALITY IN WATER BODIES,
R. A. Poluektov.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Karkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 442-450, September 1978. 4 fig, 8 ref. EPA-600/9-78-024.

Descriptors: *Water bodies, *Water quality, *Ecosystems, *Model studies, Effects, Behavior, Equations, Simulation analysis, Systems analysis, Methodology, Water biogenosis.

It is essential to construct quantitative models to reflect the behavior of existing natural systems and to forecast the impact of man's controlling actions on these systems. So far in ecosystem modeling, the problem of the specific processes of interactions among different biological species and environmental factors has not been considered. In the work reported herein, the possible outputs from specially constructed systems of differential equations were studied on a comparatively abstract level. The biological interpretation of results reflects subjective views of the investigator rather than the existing situation. Summarized is the general outline of a needed common-point-of-view approach for describing ecosystems. Discussed are principles of ecosystem modeling and modeling methods. Considered are models of interseasonal dynamics of water ecosystems, a model of seasonal dynamics of water ecosystems, and a model of diurnal activity. These dynamic models of water biogenosis can be examined as a hierarchical system of models. (See also W79-06166) (Bell Graf-Cornell)

MODE OF ELEMENTAL DISSIPATION FROM ASH BASIN EFFLUENT,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental Studies.
D. S. Cherry, and R. K. Guthrie.
Water, Air, and Soil Pollution, Vol 9, No 4, p 403-412, May 1978. 3 fig, 4 tab, 11 ref. AEC AT(38-1)-824.

Descriptors: *Fly ash, *Chemicals, *Water pollution, On-site investigations, On-site data collec-

tions, Chemical analysis, Neutron activation analysis, Elements(Chemicals), Pollutants, Pollutant identification, Path of pollutants, Effluents, Biology, Biota, Benthos, Sediments, Water quality, Pollutant dissipation.

The dissipation of chemical elements from ash basin effluent was determined by use of neutron activation analysis of sediment, water, plant, invertebrate, and vertebrate samples taken from successive sites through the drainage system. Samples were tested for concentrations of 40 elements for a 12 month period. Three different modes of dissipation were found. The major mechanism for removal of chemical elements from effluent was sedimentation into the benthic sediment. All biota had greater concentrations of chemicals than did water, with invertebrates having slightly higher levels than did plants and vertebrates. Ten elements were more concentrated in at least one biotic group than in the sediment. Concentrations of 6 elements in the drainage system exceeded the EPA recommended limits for surface waters. The observed modes of dissipation in this aquatic system emphasize the necessity for stable biotic communities present to permit cycling of chemical elements. (Sims-ISWS)

IMPACT OF A SKI BASIN ON A MOUNTAIN WATERSHED, I. BACTERIOLOGICAL WATER QUALITY,
New Mexico Univ., Albuquerque. Dept. of Biology.
C. S. White, J. R. Gosz, and D. I. Moore.
Water, Air, and Soil Pollution, Vol 10, No 1, p 71-79, July 1978. 2 fig, 5 tab, 8 ref.

Descriptors: *Water quality, *New Mexico, *Watersheds(Basins), *Mountains, *Skiing, Coliforms, Streptococcus, Bacteria, Water pollution, Water pollution sources, Land use, Sewage treatment, Septic tanks, Salts, Recreation, Recreation facilities, Recreation wastes, Effects, Potable water, Sampling, Analysis, *Santa Fe(NM), Ski basin impact.

Stream samples were taken at 1 control area above and 2 areas below the Santa Fe Ski Basin. Samples were analyzed for total coliform, fecal coliform, and fecal streptococci. The average ratio of fecal coliform to fecal streptococci below the ski basin was actually lower than the average ratio at the control site. The lower ratio indicates no further contamination from human sources below the ski basin. The coliform colonies isolated were probably from mammals other than human or from human sources other than the sewage disposal system at the ski basin. The few colonies isolated from the stream indicate that the water is not potable during certain seasons. (See also W79-06391) (Sims-ISWS)

IMPACT OF A SKI BASIN ON A MOUNTAIN WATERSHED, II. HEAVY METALS,
New Mexico Univ., Albuquerque. Dept. of Biology.
D. I. Moore, J. R. Gosz, and C. S. White.
Water, Air, and Soil Pollution, Vol 10, No 1, p 81-93, July 1978. 7 tab, 16 ref.

Descriptors: *Water quality, *Watersheds(Basins), *Mountains, *Heavy metals, Skiing, Recreation facilities, Streams, Snowpacks, Lichens, Sampling, Chemical analysis, Pollutant identification, Chemicals, Metals, Pollutants, Water pollution, Water pollution sources, Path of pollutants, Ski basin impacts, Automobile exhaust.

The input of heavy metals by automobile exhaust pollution associated with the ski basin activities was the primary concern of this paper. Stream, snowpack, and lichen samples were collected and analyzed for Pb, Zn, and Cu. Some lichen samples were also analyzed for Ca, Mg, Na, K, Fe, and Mn, as well as Pb, Zn, and Cu. Snowpack samples from roadside areas demonstrated increased levels of Pb and Cu in comparison to areas up to 180 m from the road, but heavy metal levels at more remote areas were comparable to roadside levels. In all snow samples, the heavy metals associated with the particulate matter were the major form of all inputs. Heavy metals in streams were also highly correlated with the particulate matter content. Heavy metal inputs to the watershed were greater than stream export, indicating an accumulation of heavy metals by the system. The forest canopy appears to be the major factor in the accumulation of heavy metals, probably due to better interception and impaction of the particulate matter by the canopy. POLLUTION PROFILE OF A RIVER,
Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.
A. C. Paul, and K. C. Pillai.
Water, Air, and Soil Pollution, Vol 10, No 2, p 133-146, August 1978. 6 fig, 7 tab, 9 ref.

Descriptors: *Water pollution, *Pollutants, *On-site investigations, *Pollutant identification, Rivers, Sediments, Sediment transport, Path of pollutants, Water pollution sources, Industries, Effluents, Chemicals, Metals, Chlorides, Fertilizers, Nutrients, Radioactive wastes, Chemical analysis, Sampling, *Periyar River(India), *India.

A host of chemical industries subject the Periyar River, India, to pollutants such as acids, alkalies, and their salts and trace metals and radionuclides belonging to the Th and U chains. Proximity of different outfalls and poor lateral mixing in the river are responsible for high local aquatic concentrations. Scavenging reactions, in situ, and sedimentation of suspended matter result in the accumulation of radionuclides near the outfall area. Monsoons 'flush out' the river into the backwater area, and translocation of sediments is the major factor in the transport of pollutants. (Sims-ISWS)

Descriptors: *Water quality, *Monitoring, *Sampling, *Water quality standards, *Utah, Rivers, Sediments, Suspended solids, Turbidity, Water chemistry, Chemicals, Pollutants, Pollutant identification, Water pollution, Water pollution sources, Biology, Biological properties, Benthos, Benthic fauna, Water temperature, Streamflow, Hydrogen ion concentration, *Virgin River(Utah).

The Technical Investigations Branch of the Environmental Protection Agency, Region VIII, conducted an intensive water quality study in the Virgin River and Kanab Creek drainages in southwestern Utah in March, 1976. The study was requested by the Five County Association of Governments, the local '208' water quality management planning agency. Water, sediment, and benthic samples were collected at selected locations throughout a total stream reach of 174 km. Study results indicated a gradual degradation of water quality downstream from Zion National Park. Violations of recommended criteria/standard levels were most common for the salinity parameters, but concentrations of arsenic, iron, manganese, and mercury also exceeded recommended levels. In addition, high concentrations of suspended solids impaired the quality of water throughout much of the study area. (Sims-ISWS)

A SUMMARY OF KNOWLEDGE OF THE SOUTHERN CALIFORNIA COASTAL ZONE AND OFFSHORE AREAS. VOL. I - PHYSICAL ENVIRONMENT: VOL II - BIOLOGICAL ENVIRONMENT; VOL III - SOCIAL AND ECONOMIC ELEMENTS.
Southern California Ocean Studies Consortium, California State University and Colleges Long Beach, California. Dailey, M.D.; Hill, B.; and Lansing, N. (Eds.). September, 1974. BLM-08550-CT4-1.

Descriptors: *Baseline studies, *Resources development, *Environmental effects, *Water pollution sources, *Water pollution effects, Geology, Climatology, Oceanography, Oil pollution, Heavy metals, Thermal pollution, Biota, Economics, Social aspects, *Outer Continental Shelf, *Environmental impact, Southern California Bight.

A report which offers a description of the economic and physical forces, and biological and social resources existing in the Southern California Continental Borderland Area provides the basis for analyzing the feasibility of offering some of the Area for future mineral development, and assessing the environmental impacts that might result from a proposed leasing action. The subject matter has been grouped into three volumes which reflect the major disciplines as examined: I. Physical Environment; II. Biological Environment; III. Social and Economic Elements. Each volume includes a master bibliography for its contents. Each of the twenty-two separate chapters is essentially self-contained and intended to stand alone as a summary of the available knowledge in that subject. (See W79-06450 thru W79-06463) (Sinha-OEIS)

5B. Sources Of Pollution

NATURAL DISTRIBUTION AND ENVIRONMENTAL BACKGROUND OF TRACE HEAVY METALS IN ALASKAN SHELF AND ESTUARINE AREAS,
Alaska Univ., Fairbanks. Inst. of Marine Science.
D. C. Burrell.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol VIII, Contaminant Baselines, p 199-494, October 1978. 44 fig, 59 tab, 12 ref, 6 append. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-56.

Descriptors: *Baseline studies, *Heavy metals, *Sediments, *Bacteria, *Benthos, Water pollution sources, *Cadmium, Biota, Toxicity, Coasts, Estuaries, Shellfish, Mammals, Selenium, Manganese, Nickel, Alaska, *Outer Continental Shelf.

The data indicate that the sediments, water and indigenous biota of the Alaskan shelf and coastal waters have heavy metal contents which are as low or lower than those recorded elsewhere for similar unpolluted oceanographic environments in more temperate regions. The sediments contain concentrations of extractable trace metals which are a function of the grain size distribution, for example and, as would be expected, no unnatural enrichments have been recorded. Similarly, the means for the soluble contents of metals in the water column correspond to those recorded for open ocean areas anywhere. Enhanced values adjacent to the bottom were commonly observed; this is here likely to be due to the incorporation of fine grained particulate and colloidal material rather than, say, regeneration of metals from biota debris but is, in either case, a natural feature. The most comprehensive set of data are for marine mammals from the Bering Sea. Relatively enhanced values for toxic metals such as cadmium in kidney and liver samples are recorded. A major effort has been concerned with the uptake of heavy metals by natural marine sediment bacteria populations and transfer to the deposit feeding benthos. Initial results show that cultured heterogenous marine bacteria strongly concentrate cadmium and that, when used as a food source by detritivore clams, they later show elevated (though not magnified) concentrations. CHARACTERIZATION OF ORGANIC MATTER IN SEDIMENTS FROM LOWER COOK INLET,
California Univ., Los Angeles. Inst. of Geophysics and Planetary Physics.
S. Brenner, I. R. Kaplan, M. I. Venkatesan, J. Bonilla, and E. Ruth.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol VIII, Contaminant Baselines, p 589-621, October 1978. 4 fig, 7 tab, 13 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-6-022-35250.

Descriptors: *Analysis, *Organic matter, *Baseline studies, *Sediments, *Water pollution sources, Paths of pollutants, Oil pollution, Environmental effects, Resources development, Alaska, *Outer Continental Shelf, *Petroleum hydrocarbons, *Biogenic hydrocarbons.

A large portion of the effort in the past contract year has been devoted to the development of reliable extraction and analysis procedures. Satisfactory analysis of sediment samples containing even every small amounts of organic components can now be performed. All Lower Cook Inlet samples from 1876-1977 cruises have been analyzed and the data processed. Analyses of samples from the other regions of Alaska OCS is nearly complete as well. Each sample was analyzed for: (1) total carbon content, (2) organic carbon content, (3) sulfur content, (4) aliphatic hydrocarbons, and (5) aromatic hydrocarbons. No signs of petroleum hydrocarbons input were detected, hence the organic content of the sediments is biogenic, derived from terrestrial and marine sources. Since it was possible to distinguish between marine and terrestrial sources of hydrocarbons, this information should allow the prediction of the fate of petroleum introduced into Lower Cook Inlet through routine activity or through accidental spillage. LONGITUDINAL DISPERSION WITH NON-LINEAR ADSORPTION IN POROUS MEDIA,
Maryland Univ., College Park. Water Resources Research Center.
T. Tagamets.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 578, Price codes: A06 in paper copy, A01 in microfiche. Technical Report No 52(6), (1973), 93 p, 15 fig, 45 ref, 2 append. OWRT A-023-MD(2). 14-31-0001-5020.

Descriptors: Ground water, Adsorption, Pollutant removal, Longitudinal dispersion, Porus media, *Path of pollutants, *Groundwater, Pollutant dispersion, Soil water movement.

Evaluation and quality control of ground water requires a better understanding of the physicochemical processes that determine the degree of retention or movement of pollutants in ground water. The distance that a polluting substance moves in soil depends on physical and chemical parameters. The physical parameter can be described as a transport step and the chemical parameter as an attachment step. To predict movement of a pollutant through soil requires that both parameters be incorporated in a predictive model. The adsorption of many solutes on activated charcoal and soils follow a non-linear rather than a linear isotherm. A one-dimensional dispersion equation subject to a non-linear isotherm has been formulated and solved using a finite difference scheme. A comparison between the theoretical results and some experimental data is presented.

Woodward-Clyde Consultants, San Francisco, CA.
L. Schieler.
In: Proceedings of the First Workshop On Sampling Geothermal Effluents; Workshop held October 20-21, 1975, Las Vegas, Nevada. Report EPA-600/9-76-011, p 36-66, May 1976. 12 tab, 11 ref.

Descriptors: *Geothermal studies, *Thermal water, *Pollutants, *Toxins, Hydrogen sulfide, Ammonia, Chemicals, Salts, Gases, Radioisotopes, Radioactive wastes, Water pollution, Water pollution sources, Effluents, Hazards, Groundwater.

Exploitation of geothermal resources is hampered by a lack of understanding of the basic chemical interactions and toxicity hazards associated with the gaseous and aqueous effluents characteristic of various geothermal areas. The objective of this paper was the evaluation of the relative hazards of the various effluents in both liquid- and vapor-dominated fields in terms of concentration and chemical toxicity effects. Many chemical species must be considered in evaluating liquid-dominated systems, but only a few volatile species are significant in vapor-dominated systems. This is a direct consequence of the thermodynamic equilibria established among the chemical elements over the wide range of temperatures encountered in various geothermal areas. Vapor-dominated systems are lacking the aqueous phase required for dissolving water soluble salts. Since water is present as steam rather than as liquid, vapor-dominated systems tend to be lower in total dissolved solids than liquid-dominated systems. Volatility is the primary transport mechanism in vapor-dominated systems. (See also W79-06052) (Sims-ISWS)

DISPERSION OF SOLUBLE POLLUTANTS I NON-UNIFORM RIVERS, I. THEORY,
Commonwealth Scientific and Industrial Researc Organization, North Ryde (Australia).
B. M. Chapman.
Journal of Hydrology, Vol. 40, No. 1/2, p 139-15 January 1979. 6 fig, 7 ref.

Descriptors: *Dispersion, *Pollutants, *River *Model studies, Mathematical models, Theoretica analysis, Equations, Non-uniform flow, Mixing Velocity, Diffusion, Convection, Path of pollu ants, Water pollution, Flow, Hydrology, Solubl pollutants.

An analytical framework was developed to repre sent the solute dispersion behavior of a river whos local average velocity, flow rate, and dispersio characteristics vary along its length. A coordinat transformation through which the concept of dispersion coefficient was replaced by that of characteristic time allows the use of dimensionles equations. By measuring concentration-time pro files at various stations downstream from a poin where a slug of pollutant is instantaneously re leased, it was possible to determine the variation o the characteristic time of the river along its length (See also W79-06066) (Sims-ISWS)

DISPERSION OF SOLUBLE POLLUTANTS IN NON-UNIFORM RIVERS, II. APPLICATION TO EXPERIMENTAL RESULTS,
Commonwealth Scientific and Industrial Research Organization, North Ryde, (Australia).
B. M. Chapman.
Journal of Hydrology, Vol. 40, No. 1/2, p 153-163 January 1979. 9 fig, 1 tab, 4 ref.

Descriptors: *Dispersion, *Pollutants, *Rivers *Model studies, Mathematical models, Theoretica analysis, Equations, On-site investigations, Dye releases, Nonuniform flow, Mixing, Diffusion, Velocity, Path of pollutants, Water pollution, Flow, Hydrology, Soluble pollutants.

The use of the theory of dispersion in non-uniform rivers, presented in Part I of this series, was demonstrated using 2 sets of previously published experimental results. The first set of data was obtained at 2 downstream stations following an accidental spill of chloroform in the Mississippi River. The second set of data involved the measurement of concentration-time profiles following the intentional release of soluble dye in a creek. Very satisfactory fits of the data with the theory were obtained in both cases. A final example illustrated how a general concentration-time profile obtained at one station may be used to predict the profile when it reaches a second station further downstream. All calculations were carried out on a programmable pocket calculator. (See also W79-06065) (Sims-ISWS)

EVOLUTION OF CONTAMINATED GROUNDWATER IN HOLT COUNTY, NEBRASKA,
Nebraska Univ., Lincoln. Conservation and Survey Div.
M. E. Exner, and R. F. Spalding.
Water Resources Research, Vol. 15, No. 1, p 139-147, February 1979. 3 fig, 6 tab, 36 ref.

Descriptors: *Water pollution, *Nebraska, *Groundwater, *Correlation analysis, Water pollution sources, Fertilizers, Statistical models, Irrigation, Sampling, Water analysis, On-site data collections, Sands, Agriculture, Graphical analysis, Water quality, Nitrates, Model studies, *Holt County(NB), Vertical permeability, Nonpoint-source pollution, Point-source pollution.

The theoretical absence of the in situ formation of most common mineral phases and the high vertical permeability of the relatively inert soils and unsaturated layer permit detection of man-induced environmental changes in the dilute groundwater of Holt County. Correlation coefficients show many significant associations for the major ions in groundwater affected by point and nonpoint-

source contamination. Large areas of nonpoint contamination are attributed to fertilization and irrigation of the sandy soils. In these areas, increases in the average annual groundwater concentrations of Cl(-), SO4(2-), and NO3(-) average 0.44, 0.57, and 4.9 mg/l/yr, respectively. A proposed model suggests that 50% of the applied nitrogen fertilizer infiltrates to the groundwater reservoir. (Visocky-ISWS)

PHOSPHORUS INTERACTIONS IN THE AQUATIC ENVIRONMENT: A SURVEY OF THE LITERATURE,
Vermont Univ., Burlington. Water Resources Research Center.
D. W. Meals, Jr., and E. A. Cassell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-293 418, Price codes: A06 in paper copy, A01 in microfiche. Lake Champlain Basin Study, New England River Basins Commission, Burlington, Vermont, February, 1978. 104 p, 25 fig, 10 tab, 127 ref. OWRT A-036-VT(1).

Descriptors: *Phosphorus, *Aquatic plants, *Wetlands, Lakes, Streams, Marsh plants, Absorption, Sediments, Bibliographies.

The mechanisms by which phosphorus is retained in wetlands are: physical entrapment of particulate phosphorus, chemical sorption of P by organic matter and soil materials, and biological utilization of P by microorganisms and macrophytes. Many rooted aquatic plants are highly effective in removing phosphorus from water and are even capable of storing excess phosphorus in their tissues. Some wetland vegetation act to pump phosphorus from the sediments to the water through release of phosphorus from leaf tissue. Rapid decomposition of wetland plants may also release phosphorus to water. In streams, there are relationships between P concentration and stream flow. These are: the dilution effect, an inverse correlation between stream flow and concentration caused by dilution of point source P inputs by stream flow; and the runoff effect, P concentration increase with increasing stream flow caused by contribution of P from land runoff during high flow. Adsorption by sediments and biological uptake by periphyton are the most important mechanisms for P removal. Lake sediments typically contain very large quantities of P, frequently exceeding the total mass of P present in the lake water. Phosphorus tends to be adsorbed by sediment materials under aerobic conditions and desorbed under anaerobic conditions. (Steiner-Mass)

GREAT LAKES WATER QUALITY SIXTH ANNUAL REPORT. APPENDEX F. REPORT ON HAZARDOUS WASTE DISPOSAL.
International Joint Commission-United States and Canada, Windsor (Ontario). Great Lakes Water Quality Board.
1978. 34 p, 2 append.

Descriptors: *Great Lakes region, *Hazards, Toxins, *Industrial wastes, Water pollution, Waste water treatment, *Liquid wastes, Energy, Waste disposal, Regulation.

Problems generated by hazardous waste disposal in the Great Lakes Drainage Basin are reviewed. Although reasonable treatment techniques exist, current liquid industrial waste management does not sufficiently considered waste characteristics, environmental hazards, long term effects, or possible benefits from reclamation of recoverable energy components of wastes. Possible treatment techniques are reviewed. The Water Quality Board recommends the development of compatible programs and regulations for the managment of hazardous wastes be developed and enforced. These programs should be national in scope. (Small-FIRL)

MATHEMATICAL MODELING OF THE HYDRODYNAMICS AND DISPERSION OF CONTAMINANTS IN THE NEARSHORE,
Case Western Reserve Univ., Cleveland, OH. Dept. of Geology.
W. Lick.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Karkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 282-312 (Discussion p 313-315), September 1978. 19 fig, 1 tab, 13 ref. EPA-600/9-78-024.

Descriptors: *Model studies, *Hydrodynamics, *Dispersion, *Contaminants, *Lakes, *Lake Erie, *Water pollution, *Nearshore regions, Numerical analysis, Wind, Lake currents, Depth, Velocity, Powerplants, Discharge(Water), Surface temperature, Bottom topography, Thermal plumes, Equations, Open-lake waters, Prediction, Systems analysis.

Because of possible harmful effects of contaminants, it is necessary to be able to predict their dispersion and fate in large lakes. The nearshore regions of these lakes are especially important; recent studies have demonstrated significant differences between nearshore and open-lake waters. First of all, the nearshore regions are where contaminants are generally introduced; secondly, the nearshore regions are of more interest to use for such uses as recreation, water supplies, and fishing. As part of a research effort sponsored by the U.S. Environmental Protection Agency, numerical models have been developed which can realistically describe the currents and dispersion of contaminants throughout large lakes and especially in the nearshore hydrodynamic and dispersion models, which necessarily include procedures for coupling the nearshore and offshore lake circulations. Specific applications have been made to predict the dispersion of contaminants under specific conditions and to understand the physical consequences. Presented are these specific examples: (1) the wind-driven currents, both open-lake and nearshore, in Lake Erie under steady-state, constant density conditions; (2) the dispersion of a contaminant from a river into Lake Erie by wind-driven currents under present conditions and as modified by proposed large man-made islands such as a jetport in the lake; and (3) the dispersion of heat in the discharge from a power plant on Lake Michigan. Presented are a constant-density, steady-state model and a variable-density, time-dependent model; both are fully three-dimensional and give all three components of velocity at any point in the lake. MATHEMATICAL MODELING STRATEGIES APPLIED TO SAGINAW BAY, LAKE HURON,
Environmental Protection Agency, Grosse Ile, MI.
V. Bierman, W. Richardson, and T. T. Davies.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Karkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 397-430, September 1978. 19 fig, 1 tab, 48 ref. EPA-600/9-78-024.

Descriptors: *Model studies, *Lake Huron, *Saginaw Bay, *Simulation analysis, *Water quality, Drainage basins, Runoff, Phytoplankton, Great Lakes, Equations, Systems analysis, Sensitivity analysis, Mass balance.

Described is modeling research to develop quantitative tools which can be used to supplement intuition and scientific judgment in policy decisions concerning water quality. Quality problems concerning the international waters of the Great Lakes and the application of modeling techniques to Saginaw Bay are considered. Problems are categorized into a series of time and space scales. The series ranges from the short-term transport of some hazardous material within a very localized area to the long-term effects of control or limitation of nutrients or toxic materials within the drainage basins on the ecosystem of individual lakes or of the whole system of lakes. This paper attempts to integrate these different approaches. Applied are transport models and algal growth modeling concepts to Saginaw Bay to describe its prevailing conditions. The simulation model developed is based on available data on the bay, and the modeling concepts will be verified by using an extensive set of field data collected from a sampling design aimed specifically at this modeling program. This modeling system will be used to evaluate the response of the system to a range of management alternatives for enhancing water quality. (See also W79-06166) (BellGraf-Cornell)

DESIGN MODEL FOR THERMAL EFFLUENTS IN RIVERS,
Italian Electrical Power Agency, Pisa. Thermal and Nuclear Research Centre.
G. Dinelli, and L. Castellano.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY3, Proceedings Paper 14422, p 197-211, March 1979. 8 fig, 20 ref, 2 append.

Descriptors: *Thermal pollution, *Rivers, *Model studies, Mathematical models, Numerical analysis, Effluents, Water pollution, Powerplants, Eddies, Buoyancy, Temperature, Water temperature, Diffusion, Turbulence, Velocity, Viscosity, Path of pollutants, Hydraulics.

A quasi three-dimensional mathematical model describing the thermal impact of warm water discharges in rivers was presented. The governing equations were obtained integrating along the depth the complete set of the Navier-Stokes equations with Leibniz's rule and assuming that buoy-

ancy forces are negligible. After the analytical integration was performed, in the mass, momentum and energy equations, terms appeared that make it possible to account for the effects of the actual geometry of the river's cross section and bottom. The eddy viscosity and thermal diffusivity were taken into account by adopting an algebraic model of turbulence based upon the Prandtl mixing length theory. The numerical model, obtained with a finite difference method, provided the spatial, time-dependent distributions of the velocity and temperature fields. The model's results were satisfactorily checked against field data in the case of thermal discharges into fast moving rivers. (Sims-ISWS)

Descriptors: *Water quality, *Groundwater, *Iron, *Hardness(Water), *Water wells, Water analysis, Chemical analysis, Water pollution, Public health, Maps, Alaska, Fairbanks area.

Well water with concentrations of arsenic and nitrate exceeding U.S. Environmental Protection Agency standards occurs sporadically throughout the hills north of Fairbanks, Alaska. The arsenic contamination has not been correlated with placer or other mining activity. The high levels of nitrate do not generally appear related to septic waste contamination. Few wells in the Fairbanks area yield water with low concentrations of iron or low hardness. Iron concentrations are consistently greater than 3 mg/L on the flood plain. In the uplands, concentrations of both iron and hardness are lowest near the ridgetops and increase downslope. The report includes a map of the area showing the location of sampled wells and a table of chemical analysis. (Woodard-USGS)

ASSESSMENT OF NONPOINT SOURCES AREAWIDE WASTE TREATMENT MANAGEMENT PLAN FOR THE GREATER HOUSTON AREA.
Dannenbaum Engineering Corp., Houston, TX.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 736, Price codes: A17 in paper copy, A01 in microfiche. 1977. 399 p, 18 fig, 57 tab, 120 ref, 2 append.

Descriptors: *Water pollution sources, Texas, Cities, *Urban runoff, *Septic tanks, Water quality, Seepage, *Construction, Dredging, *Biochemical oxygen demand, Mathematical models, Coliforms, Industrial wastes, Pesticides, Oil, Suspended solids.

The nonpoint sources of water pollution within the Greater Houston 208 Planning Area are assessed. Water pollution resulting from urban runoff, septic tank seepages, agricultural runoff, construction site runoff, dredging, and benthal oxygen demand is considered. An analysis of 108 runoff events in several areas of the country, indicated a strong correlation between the log of the cumulative runoff volume and the log of the cumulative pollutant load. Using regression analysis, a stormwater quality-quality model was developed. When septic tank seepages were studied, the Sims Bayou Basin had the greatest pollution impact of septic tanks based on theoretical calculations. Fecal coliforms and BOD were used as septic seepage indicators. The effects of agriculture, injection wells, shipping, oil field waste disposal, and salt water intrusion on water quality were investigated. Mineral and organic suspended sediment in air and water as a result of contruction activities, was emphasized. Other pollutants considered included pesticides, nutrients, solid wastes, construction chemicals, petroleum products, and sanitary wastes. Finally, benthal oxygen demand was a significant sink of dissolved oxygen in the area, particularly in the Houston Ship Channel. (Small-FIRL)
W79-06344

ASSESSING NON-POINT SOURCE POLLUTION. A DETAILED STUDY OF A RURAL WATERSHED IN THE COASTAL PLAIN OF MARYLAND,
Smithsonian Institution, Edgewater, MD. Chesapeake Bay Center for Environmental Studies.
M. Beane, G. R. Chirlin, D. L. Correll, E. S. Friebele, and M. Faust.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 178, Price codes: A04 in paper copy, A01 in microfiche. Report 1977. 59 p, 4 fig, 15 tab, 31 ref, 2 append.

Descriptors: *Surface runoff, *Watersheds(Basins), *Heavy metals, *Nutrients, *Bacteria, *Pesticides, Sediments, Maryland, Water quality, Agricultural runoff, Coliforms, Seasonal, Pastures.

A detailed, non-point source study on a rural watershed in the coastal plain of Maryland is presented as the research has applicability to similar regions of the country. Heavy metals, nutrients, bacteria, and sediment were monitored in surface runoff from the Rhode River. The magnitude of non-point source loading to an estuary from a rural watershed and the impact of this loading on water quality, were determined. Nutrient inputs and outputs were determined for each major land use in the watershed. The average yearly discharge of nitrogen, phosphorus, calcium, and magnesium in runoff was highest for pasture, second highest for cultivated land, and very low for forest. Sediment discharge was highest in summer and increased with volume of discharge. Sixty-eight percent of the fecal coliform bacteria discharged came from pasture, 17% from forest, and 15% from cultivated land. Cultivated land had the highest discharge rate for metals in fall, while in summer, pasture had the highest rate. Fe, Mn, Cr, and possibly Cu, were derived from the soil, while Zn, Pb, and Cd were of man-made origin. Alachlor and atrazine concentrations were monitored. Alachlor did not persist in the soil and only .02% of the amount applied to the land was lost in runoff. Atrazine remained in the soil at significant levels four months after its application. Runoff contained 1.2% of the atrazine. (Small-FIRL)
W79-06353

THE SPREADING, RETENTION AND CLEAN-UP OF OIL SPILLS,
Rhode Island Univ., Kingston. Coll. of Engineering.
M. P. Wilson.
Available from the National Technical Information Service, Springfield, VA 22161 as HCP/P2756-01, Price codes: A07 in paper copy, A01 in microfiche. Report HCP/P2756-01, 1978. 126 p, 5 fig, 14 tab, 387 ref.

Descriptors: *Oils spills, Oil pollution, Water pollution control, *Barriers, *Biodegradation, *Chemical reactions, *Oceans, Dispersion, Dynamics.

The current state-of-the-art for the spreading-retention and clean-up of oil spills is reviewed with in-depth analysis of specific areas not treated in-depth in the literature. Oil spill statistics, tanker and non-tanker ship-generated pollution, and the spreading and drifting of oil slicks are discussed. Containment devices are described. Recommendations are made for basic analytical and experimental studies in barrier technology including fluid dynamics of oil slicks, surface active chemical agents, fast current barrier studies, barrier dynamics, and potential hazards from the use of barriers. Natural and forced biodegradation, and natural and chemical dispersion of oil into the marin environment, are discussed. Research and develo ment needed to mitagate the environmental impa of oil pollution are discussed including preventiv techniques, containment, clean-up, and dispersio (Small-FIRL)

IMPACT OF MAN'S ACTIVITIES ON THE CHEMICAL COMPOSITION OF THE SEDI MENTS OF LAKES SUPERIOR AND HURON
Canada Centre for Inland Waters, Burlington (On tario).
A. L. W. Kemp, J. D. H. Williams, R. L. Thomas, and M. L. Gregory.
Water, Air, and Soil Pollution, Vol. 10, No. 4, p 381-402, November 1978. 7 fig, 6 tab, 52 ref.

Descriptors: *Sediments, *Pollutants, *Lake Huron, *Lake Superior, *Great Lakes, Sampling, Chemicals, Organic matter, Metals, Heavy metals, Particle size, Hydrogen ion concentration, Oxidation-reduction potential, Water pollution, Water pollution sources, Path of pollutants, Sedimentation.

The concentrations of organic matter, major elements, and trace elements were determined at 15 core locations in Lakes Superior and Huron. The chemical compositions of the cores were related to sediment particle size, Eh, pH, chronology, and location. Concentrations of Si, Al, Ca, Mg, K, Na, and Ti, which represent the major mineral species in the sediments, were generally uniform in each core. Surface enrichments of Hg, Pb, Zn, Cu, Ni, Co, Cd, Cr, Be, V, As, Org-C, and N at many of the locations were attributed to anthropogenic inputs of these elements in recent years. Concentration profiles of Fe, Mn, P, and S are influenced by migration of these elements in the pore waters. High anthropogenic Cu loadings in Lake Superior were related to Cu mining activities in the lake basin, while high anthropogenic inputs of Ni to the Lake Huron sediments were related to Ni contamination from the Sudbury area. Sediment loading calculations showed that the anthropogenic inputs of trace and nutrient elements are related to the sedimentation rate, that the inputs are dispersed over wide areas of the lakes, and that inputs to Lake Superior have increased significantly since 1955. Evidence was presented that atmospheric inputs are an important source of contaminants. (Sims-ISWS)

RATES OF LEACHING OF RADIUM FROM CONTAMINATED SOILS: AN EXPERIMEN-

TAL INVESTIGATION OF RADIUM BEARING SOILS FROM PORT HOPE, ONTARIO,
Toronto Univ. (Ontario). Dept. of Chemical Engineering and Applied Chemistry.
J. S. Nathwani, and C. R. Phillips.
Water, Aid, and Soil Pollution, Vol 9, No 4, p 453-465, May 1978. 5 fig, 4 tab, 6 ref.

Descriptors: *Radium, *Leaching, *Soil contamination, *Laboratory tests, *Canada, Radioactivity, Radioactive wastes, Radioactive waste disposal, Acids, Acidity, Acidic water, Hydrogen ion concentration, Soils, Infiltration, Pollutants, Path of pollutants, Groundwater, Water quality, Water pollution, Water pollution sources.

The leachability of Ra-226 from soil at Port Hope, Ontario, contaminated by waste from a long established U refinery was described. A small-scale static leach test was devised to provide information to permit an assessment of hazard due to leaching in the environment. Two different leaching solutions were prepared to simulate a range of infiltrating water quality in disoposal environments: one by bubbling CO2 into distilled water to pH 5.5, and another by bubbling SO2 into water to pH 3.5. Narrow-range size fractions of the soils (i.e., 0.250 to 0.105 mm) were leached for 30 to 45 days (equivalent rainfall of 2 to 3 yr). It was found that leaching is significantly affected by soil texture, total amounts leached and the maximum concentrations reached being much greater for coarser and intermediate size fractions than for fine soil fractions. Also, leachant acidity significantly increased leaching rates and resulted in enhanced mobility in soils. A straight line for the plot of Q/Q sub o (cumulative fraction released) vs square root of T (T is leaching time in days) indicated that leaching could be considered to be a diffusion phenomenon in accordance with Fick's law. Diffusion coefficients ranging from 5 x 10 to the minus 11th power to 2 x 10 to the minus 13th power sq cm/day were found. These coefficients provide a basis for estimating the fraction that would be leached over longer periods. (Sims-ISWS)

LEACHING OF PHOSPHATE FROM AGRICULTURAL SOILS TO GROUNDWATER,
Connecticut Agricultural Experiment Station, New Haven. Dept. of Soil and Water.
B. L. Sawhney.
Water, Air, and Soil Pollution, Vol 9, No 4, p 499-505, May 1978. 3 fig, 2 tab, 16 ref.

Descriptors: *Leaching, *Phosphates, *Soil water movement, *Groundwater, Phosphorus, Phosphorus compounds, Soil water, Fertilizers, Sewage sludge, Agriculture, Crops, Pollutants, Path of pollutants, Vegetation effects, Water pollution, Water pollution sources, Water quality.

To examine the fate of P added to soils as fertilizer and to assess potential P losses to groundwater, different forms of P at increasing depths in soils and P concentration in effluents from tile drains were determined. The estimates of soil P showed that the fertilizer P applied over a number of years accumulated mainly in the plow layer, suggesting that P losses to groundwater from cultivated soils with deep water table are minimum. Analyses of effluents obtained over a 1 yr period from tile drains in 4 soils in different crops, however, showed that the concentration of P varied from 12 ppb to 124 ppb. The concentration of P in effluent from the soil with the largest amount of P in the plow layer remained the largest throughout the year. Apparently, in cultivated soils with the tile drains, flooding may produce reducing conditions resulting in greater mobility of P. (Sims-ISWS)

FIELD PROCEDURES AND EVALUATION OF A SLUG DILUTION GAUGING METHOD IN MOUNTAIN STREAMS,
Geological Survey of Canada, Ottawa (Ontario).
T. J. Day.
Journal of Hydrology (New Zealand), Vol 16, No 2, p 113-115, 1977. 8 fig, 8 tab, 20 ref.

Descriptors: *Mixing, *Waste dilution, *Streams, *Tracers, Stream flow, Turbulence, Channels, Mountains, On-site investigations, On-site data collections, Data processing, Equipment, Instrumentation, Sampling, Salts, Sodium chloride, Hydraulics, Hydrology, *New Zealand.

The application of a method (NaCl) of dilution gaging in turbulent mountain streams was evaluated with discussions about equipment, field procedures, mixing lengths, tracer losses, and the precision of derived hydraulic parameters. Mixing lengths were shown to be equal to 25 mean channel widths, and that this length was independent of the cross-sectional position of injection. Tracer losses were described as linear features, although no explanation can be offered. Precision, expressed as percentage probable error about the means of the 4 pertinent hydraulic variables, was discussed, with individual errors ranging from 1 to 21%, median errors ranging from 4.7 to 7.3% and modal errors ranging from 3.6 to 6%. Comments on sampling procedures were offered, and several simplified procedures for estimating the mean velocity and discharge were presented. (Sims-ISWS)

W79-06449

GEOLOGICAL FEATURES,
California State Univ., Long Beach.
J. Dennis.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol. 1, p 1-1 - 1-59, September 1974. 11 fig, 2 tab, 222 ref.

Descriptors: *Baseline studies, *Hazards, *Geologic history, Resources development, Water pollution sources, Seismology, Earthquakes, Oil, *Outer Continental Shelf, Natural seeps, Tars.

Basic current knowledge of the geology in the Southern California coastal Zone and the offshore continental borderland is summarized and a guide to the relevant literature is provided. Southern California geology is complicated because large displacements along faults have subdivided the crust here into a number of morphotectonic segments or blocks whose mutual geologic relationships are still, in large measure, controversial. In the area under consideration, earthquake risk is greatest along the coast, diminishing seaward. Oil and tar, as well as gas seeps, are associated with the Los Angeles basin and its extension offshore. They do not extend south of Huntington Beach. Seeps are usually transient phenomena. Their exact source on the sea floor is very difficult to determine. Commonly, they occur as groups of small individual seeps concentrated in a restricted area where a structural trap has been tapped by erosion. They may be activated or reactivated by tectonic or seismic movement. Unstable slopes and cliffs are very characteristic of the coastal zone under consideration. A brief summary of slope evolution in late Pleistocene and Recent time is given. Subsidence has occurred in the area under consideration where fluids have been withdrawn from underlying rocks. This includes both groundwater and oil. Such subsidence can be prevented by controlled water injection during oil withdrawal. (See also W79-06449) (Sinha-OEIS)

CHEMICAL OCEANOGRAPHY,
California State Univ., Long Beach.
K. M. Chan.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol 1, p 4-1 - 4-81, September 1974. 26 fig, 10 tab, 91 ref.

Descriptors: *Baseline studies, *Water pollution sources, *Chemistry, *Pollutant identification, *Water chemistry, *Water quality, Resources development, Environmental effects, Dispersion, Models, Waste, *Outer Continental Shelf, *Southern California Bight, Outfalls, Natural seeps.

The major water mass off Southern California is the California Current, which is an eastern boundary current of a large anticyclonic gyre in the Eastern North Pacific Ocean. The water carried southward by the California Current is low temperature, low salinity, but high dissolved oxygen content subarctic water. In the study area, the water is primarily from the Counter Current and the properties of the water will vary depending on the degree of mixing of the above current and water, and the extent of modification as a result of heating and cooling, dilution, evaporation, biological activity and, towards the coastal area, waste discharges. In the study area the main input of biologically oxidizable organic matter is from municipal waste dischargers. The trace metals input to the study area are classified as diffused and discrete sources. Their distribution pattern by area is summarized and their characteristics are discussed. The diffused sources in the study area include ocean dumping, aerial fallout, vessel waste and advective transport. The presence of the residues of polychlorinated biphenyls (PCB), and DDT compounds are widespread. Marine organisms caught from the waters off Southern California consistently contain higher concentrations of DDT residues than in those areas receiving extensive agricultural drainages. Oily substances in the marine environment may be derived from oil production, industrial wastes, municipal waste, spill during transportation, and accidents. The non-anthropogenic source of oil is probably from submarine seeps. (See also W79-06449) (Sinha-OEIS)
W79-06453

HYDROGRAPHY OF HARBORS, LAGOONS AND SLOUGHS,
California State Univ., Fullerton.
N. J. Maloney, and K. M. Chan.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol 1, p 5-1 - 5-66, September 1974. 29 fig, 9 tab, 65 ref.

Descriptors: *Baseline studies, *Hydrography, *Water resources, Lagoons, Harbors, *Water pollution sources, Geomorphology, Coasts, Tides, Waste disposal, Water pollution, Resources development, Environmental effects, *Outer Continental Shelf, *Flushing, Southern California Bight, Sloughs.

The project area includes 18 lagoons and harbors that fall into the following general categories: (1) Salt marsh lagoons, (2) man-made small boat harbors, (3) man-made deep water harbors, (4) continental shelves protected by breakwaters, (5) estuaries of intermittent streams. Man has physically altered these bodies of water by construction for industrial, recreational, and residential purposes; and chemically altered the water by adding pollutants of various types. The larger embayments remain open to the ocean and receive tidal flushing. Seasonal storm run-off, power plant coolant water, and sewage outfalls increase the flushing rate. The health of a bay depends upon the relationship between the pollutant inflow and the flushing. The small lagoons are cut off from the ocean by barrier spits for long periods of time. They do not receive tidal flushing and may revert to fresh or hypersaline water depending on the local run-off conditions. These lagoons are highly vulnerable to pollution because they are not diluted by tidal action. (See also W79-06449) (Sinha-OEIS)
W79-06454

POLLUTION SOURCES,
California State Univ., Long Beach.
W. H. Reed, and T. P. Bakker.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol 1, p 6-1 - 6-99, September 1974. 30 fig, 30 tab, 102 ref.

Descriptors: *California, *Water pollution sources, *Baseline studies, *Pollutants, Waste disposal, Heavy metals, Thermal pollution, Resources development, Environmental effects, Chlorinated hydrocarbon pesticides, *Outer Continental Shelf, Southern California Bight, Ocean dumping.

That portion of the Southern California Bight covered by this study and the tributary area bounded on the north, east and south by the Transverse and Peninsular ranges and the U.S. Mexican border are inter-related by several varied and/or extreme geographic-oceanographic-geomorphic, climatic and demographic conditions. The introduction of pollutants into the marine environment can occur as discharges from municipal waste water treatment plants, industrial plants, electrical generating stations, and water-borne vessels. Additionally, pollutants can enter the marine environment as surface runoff, aerial fallout, flaking and dissolution of antifouling vessel paints, and direct ocean dumping from barges and other vessels. Substances introduced include sewage sludge, waste water treated only to remove floatable and suspended solids, garbage, chlorine, phosphates and nitrates, heated water, chlorinated hydrocarbons and heavy metals. It should be noted that over one-half the population (nearly 11 million people) of the State of California reside in these portions of Los Angeles and San Diego Counties that contribute to the pollution of the area. This is over 5% of the U.S. population. (See also W79-06449) (Sinha-OEIS)
W79-06455

PHYTOPLANKTON,
California State Polytechnic Univ., Pomona.
R. Z. Riznyk.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol. 2, p 7-1 - 7-33, September 1974. 8 fig, 2 tab, 106 ref.

Descriptors: *Baseline studies, *Phytoplankton, *Ecosystems, *Water pollution sources, Environmental effects, Toxins, Red tide, Waste disposal, Sewage disposal, Resources development, *Outer Continental Shelf, Southern California Bight.

The importance of phytoplankton in the ecology of Southern California coastal and offshore areas involves three major aspects: (1) Their productive nature is of paramount importance as the base of the food chain and any change in their abundance or community structure will invariably affect subsequent portions of the chain. (2) Excessive enrichment or eutrophication of local areas may result in the phytoplankton bloom which can discolor the water, produce noxious odors, cause fish kills, make shellfish unfit for human consumption and interfere with the recreational potential of an area. (3) Their uptake of toxic materials which may enter the food chain is of utmost importance to the seafood industry and the welfare of man. Most ecological research has been with regard to the effect of sewage outfalls on species composition, standing stock and productivity. Generally it has been noted that production and standing stock is highest in outfall areas than in control areas. No change in species composition has been noticed. No relationship has been established between the red tide and sewage outfalls. (See also W79-06449) (Sinha-OEIS)

BENTHIC ALGAE AND GRASSES,
California State Univ., Fullerton.
S. N. Murray.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol 2, p 9-1 - 9-61, September 1974. 2 fig, 10 tab, 146 ref.

Descriptors: *Benthos, *Algae, *Grasses, *Baseline studies, Ecology, Water pollution effects, Environmental effects, Resources development, *Outer Continental Shelf, Southern California Bight.

A summation and evaluation of published studies concerned with marine benthic algae and grasses of southern California is provided. Literature included in this report has been largely confined to that collected directly within the circumscribed area, although attempts have been made to include additional relevant material where appropriate. The great majority of the literature discussed has been concerned with macro-algae (Chlorophyta, Phaeophyta and Rhodophyta) and grasses (Spermatophyta) collectively referred to as macrophytes. Relatively little information exists on micro-algal components of the marine benthos, e.g., Cyanophyta (blue-green algae), benthic Bacillariophyta (diatoms) and benthic Chrysophyta (chrysophytes), for the southern California region as well as worldwide. The contents of this report have been organized under the topics of taxonomy, ecology and economic resources. (See also W79-06449) (Sinha-OEIS)

TRANSPORT MECHANISMS AND HYDROCARBON ADSORPTION PROPERTIES OF SUSPENDED MATTER IN LOWER COOK INLET,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
R. A. Feely, J. D. Cline, and G. J. Massoth.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol VII Contaminant Baselines, p 11-72, October 1978. 2 fig, 5 tab, 38 ref. NOAA, Outer Continental She Environmental Assessment Program, Boulde Colorado.

Descriptors: *Bottom sediments, *Suspended loa *Oil pollution, *Circulation, *Estuaries, Enviro mental effects, Baseline studies, Resources deve opment, Water resources, Alaska, *Outer Cont nental Shelf, *Cook Inlet, Crude oil, Estuarin processes.

The seasonal distributions and elemental composi tion of suspended particulate matter in Lowe Cook Inlet were studied and compared with cur rent patterns and bottom sediment distributions. I general, the suspended matter distributions appea to follow the pattern of circulation in Lower Coo Inlet and Shelikof Strait. Comparisons of physica characteristics of suspended matter and sediment from the central basin indicates that net sedimenta tion of the fine grained suspended particles is mini mal. However, sedimentation may be occurring i the numerous embayments along the coast. Chemi cal analysis of the particulate matter reveals tha fine grained aluminosilicate minerals comprise about 80-95% of the suspended matter with bio genic material making up the rest. Analysis o seasonal variations of the C:N ratio of the particu late organic matter indicates that organic matter o marine origin is dominant in summer whereas ter restrially derived organic material predominates i winter when productivity is low. Laboratory ex periments involving the interactions between Cook Inlet crude oil and suspended matter from Lower Cook Inlet show that the accommodation capacity of suspended matter for crude oil increases with the concentration of added oil. Important parameters in the accommodation process include: the chemical nature and viscosity of the oil; the mineralogical and size characteristics of the particulate matter; temperature; and degree of mixing. In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol VIII, Contaminant Baselines, p 495-588, October 1978. 6 fig, 11 tab, append. 03-5-022-56.

Descriptors: *Baseline studies, *Water pollution sources, *Oil pollution, *Sediments, Environmental effects, Resources development, Alaska, Distribution, *Outer Continental Shelf, *Hydrocarbons, *Aromatic hydrocarbons, Petrogenic hydrocarbons, Biogenic hydrocarbons.

Work completed in the study of the distribution and dynamics of hydrocarbons on the Alaskan outer continental shelf is reported. A striking finding is the observation that sediments from the Beaufort Sea and from Cook Inlet contain suites of

aromatic hydrocarbons. The data indicate that the sources of these hydrocarbons are multiple and complex. It appears that anthropogenic pyrolysis may be a contributing source. This is the first hint that the Alaskan marine environment may not be generally pristine. A preliminary statistical treatment of multiple determinations of hydrocarbons in sediment is reported. Although this treatment is not complete, important conclusions can be reached about the relationship of present analytical variability to natural environmental variability. A study of the interactions of hydrocarbons with suspended sediments of Southcentral Alaska is presented in detail. Quantitative information about this process, which has been the subject of considerable speculation, is presented. (Sinha-OEIS)

ON THE PEROXODISULPHATE OXIDATION OF TOTAL NITROGEN IN WATERS TO NITRATE,
Uppsala Univ. (Sweden). Dept. of Analytical Chemicstry.
F. Nydahl.
Water Research, Vol 12, No 12, p 1123-1130, 1978. 8 tab, 10 ref.

Descriptors: *Nitrate, *Nitrogen, *Oxidation, *Measurement, *Analytical techniques, *Methodology, Nutrients, Degradation(Decomposition), Koroleff method, Alkalinity, Water temperatures, Nitrites, Dyes, Cadmium, Hydrogen ion concentration, Reagents, Chemistry, Digestion.

An improved experimental basis is presented for the oxidation-process method of determining total nitrogen in natural waters (the standard methodology in use by the Scandinavian countries). Following a discussion of the proper concentrations of peroxodisulfate and sodium hydroxide for digestion and the proper pH and buffer system for reduction, a new reagent is proposed whose concentrations of peroxodisulfate and sodium hydroxide are founded on stoichiometric relations at the autodecomposition of the peroxodisulfate; the proper pH of 8.0 for reduction is achieved by adding the calculated amount of Tris (hydroxymethyl) aminomethane hydrochloride. A method is given for preparing potassium peroxodisulfate of a very low nitrogen blank. Digestion is performed at 100 or 120C. Requisite digestion time, a function of the autodecomposition of the peroxodisulfate, was 90 min at 100C, or 15 min at 120C. Yields obtained by oxidation of various nitrogen compounds were similar at both temperatures, but were dependent on the form of the nitrogen linkage. Accuracy of the method is dependent on the nature of the nitrogen compounds and their concentrations; a negative error of 0-8% seems probable. (Lynch-Wisconsin)

FACTORS AFFECTING PHOSPHATE ABSORPTION EQUILIBRIA IN LAKE SEDIMENTS,
Dufresne-Henry Engineering Corp., North Springfield, VT.
W. C. Ku, F. A. DiGiano, and T. H. Feng.
Water Research, Vol 12, No 12, p 1069-1074, 1978. 5 fig, 2 tab, 18 ref.

Descriptors: *Phosphates, *Absorption, *Equilibrium, *Lakes, *Sediments, *Cycling nutrients, Massachusetts, Lake Warner(MA), Lake Wyola(MA), Nutrients, Phosphorus, Model studies, Langmuir model, Mathematical models, Water pollution sources, Interstitial water, Eutrophication, Mesotrophy, Hydrogen ion concentration, Water temperature, Aluminum, Iron, Calcium, Chemistry, Oxidation-reduction potential.

A comparative laboratory study of phosphate absorption in noncalcareous sediments from Lakes Wyola and Warner, Massachusetts (16 km apart and connected by the Mill River) showed both aluminum and iron to be important binding metals, but sediment phosphate absorption in highly eutrophic Lake Warner was more controlled by iron, and in mesotrophic Lake Wyola more by aluminum. The Langmuir absorption model was used to describe quantitatively effects of redox, pH, and temperature on sediment equilibria. The model mathematically describes experimental data, and is compatible with a possible mechanism of phosphate binding. The difference between the sediments was evident from the less-diminished sorptive potential shown by Lake Wyola sediment under anaerobic conditions, and reinforced by comparison of absorption before and after oxalate extraction. A difference in phosphate binding was also seen in differences in pH dependency of absorption by the two sediments. Absorption isotherms at 11 and 20C also indicated a significant decrease in the exothermicity of the reactions at lower pH, suggesting that more than one mechanism is operative in the pH range of 5.5-7.0. Overlying water in Lake Wyola generally had a phosphate concentration of < 20 microg/l throughout the year, and interstitial phosphorus was 100 microg/l. In Lake Warner phosphate reached 9-100 microg/l in summer, decreasing to 60-80 microg/l in winter; interstitial phosphorus ranged from 400-600 microg/l. (Lynch-Wisconsin)

GENERAL ASPECTS OF WATER POLLUTION BY THE PULP AND PAPER INDUSTRY (ASPECTOS GENERALES DE LA CONTAMINACION DEL AGUA POR LA INDUSTRIA DE PULPA Y PAPEL),
I. Acosta-Contreras.
Instituto Forestal Latino-Americano, Merida, Venezuela, Boletin No. 52, p 27-54, 1977. 28 ref, 9 tab. English Summary.

Descriptors: *Pulp and paper industry, *Water pollution, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Effluents, Air pollution, Solid wastes, Water quality, Water analysis, Waste water treatment, Waste treatment, Legislation, United States, Canada, Foreign countries, Japan, Sweden, France, Economic impact, Water pollution control, Water pollution effects.

A review is presented of the influence of pulp and paper production on the environment (water pollution, air pollution, pollution by solid wastes, indirect pollution); the relationship between water quality and industrial processes (wood preparation, mechanical pulping, neutral sulfite semichemical pulping, sulfite pulping, sulfate pulping, pulp screening, washing, cleaning, and bleaching, paper machine operations, and finishing and converting); analysis of water pollution by the pulp and paper industry; methods for reducing water pollution (primary, secondary, and tertiary treatment within the mill, treatment outside the mill); legislation relating to the reduction of water pollution in the U.S.A., Canada, Japan, Sweden, and France; and the economic impact of water pollution control on the pulp and paper industry. (Speckhard-IPC)

Descriptors: *Pulp wastes, *Water pollution effects, *Crayfish, *Toxicity, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Effluents, Aquatic animals, Alcohols, Yeast, Bleaching wastes, Water pollution.

The crayfish Pontogammarus robustoides (Amphipoda) was used to test the toxicity of effluents from two pulp and paper mills, including a mixed effluent from sulfite liquor preparation, pulp chlorination, bleach plant, and residual liquor from ethanol and yeast production; an overall effluent from pulp manufacture; and a paper mill effluent. All effluents were toxic. The mixed effluent was the most toxic. Paper mill effluent was the least toxic. The effects of pollutants included growth inhibition, reduced feed consumption, reduced respiration rate, and cannibalism. The most sensitive indicator was the hatching rate which decreased sharply at relatively low effluent concentrations (0.58% mixed effluent and 2.9% paper mill effluent). (Stapinski-IPC)

COMPLEMENTARITY OF THERMOREGULATORY RHYTHMS IN MICROPTERUS SOLMOIDES AND M. DOLOMIEUI,
Pennsylvania State Univ., Wilkes-Barre. Dept. of Biology.
W. W. Reynolds, and M. E. Casterlin.
Hydrobiologia, Vol. 60, No. 1, p 89-91, 1978, 1 fig, 14 ref.

Descriptors: *Environmental effects, *Temperature, Bass, Fish behavior, Niches, Photoperiodism, Thermoregulation, Preferred temperature.

Largemouth and smallmouth black basses were tested in an electronic thermoregulatory shuttle box, which permits a fish to control water temperatures by its movements between chambers monitored by photo cells, to determine temperature preference. With a LD 12:12 photoperiod, it was found that smallmouth bass had a preferred temperature peak of 30.1C during the latter portion of the photophase while largemouth bass were reaching a minimum of 27.1C. Smallmouth bass reached a minimum of 26.6C during the latter part of scotophase while largemouth bass reached a peak of 29.5C during mid-scotophase. The two species are sympatric over much of their ranges. It was concluded that the thermotemporal comple-

mentarity of the rhythms shown in this study suggest a possible mechanism which, in conjunction with differing light intensity preferences, could aid in segregating their respective niches. (Chilton-ORNL)

MATHEMATICAL MODELING OF EUTROPHICATION PROCESSES IN LAKE ONTARIO,
Manhattan Coll., NY. Dept. of Environmental Engineering and Science.
R. V. Thomann.
In: American-Soviet Symposium on Use of Mathematical models to Optimize Water Quality Management. Kharkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 208-242 (Discussion p 243-245), September 1978. 18 fig, 2 tab, 23 ref. EPA-600/9-78-024.

Descriptors: *Eutrophication, *Lake Ontario, *Model studies, *Great Lakes, *Water quality, *Phytoplankton, *Kinetics, Effects, Large lakes, Environmental control, Nutrient removal programs, Biological response, Conservation of mass, Model verification, Death rate, Net production, Circulation, Chlorophyll, Hypolimnetic recycling, Biological recycling, Nutrients, *Simulation analysis, Estimating, Systems analysis, Equations.

This research structures a mathematical modling framework of the major features of eutrophication in large lakes. Lake Ontario, the subject of intensive field work as part of the International Field Year for the Great Lakes, is used as the problem setting. The overall objectives of the research include: (1) determination of important interactions in lake eutrophication; (2) analysis of lake water quality and biological response to natural and man-made inputs; and (3) formation of a basis for estimating the direction of change to be expected under remedial environmental control actions. The problems of impairment of the quality of lake systems are magnified for 'large lakes' such as the Great Lakes. Their size precludes any immediate improvement in quality after control actions are taken; it is much more difficult to obtain reliable data on water quality biological structure and hydrodynamic circulation due to sampling difficulty. The general circulation may not be adequately known in relation to climatological and hydrological factors. Measures of phytoplankton populations are temporarily and spatially dependent and reflect complex interactions with nutrients, such as nitrogen and phosphorus, and upper trophic level predation. This report reviews works accomplished to date on development of a mathematical model of phytoplankton in Lake Ontario that hopefully will form a reasonable basis for estimating the effects of nutrient removal programs. MODELING THE DISPERSION OF POLLUTION AND THERMAL POLLUTATION IN WATER BODIES,
Akademiya Nauk SSSR, Novosibirsk. Inst. of Hydrodynamics.
O. F. Vasilyev.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Kharkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 246-260 (Discussion p 261-262), September 1978. 4 fig, 11 ref. EPA-600/9-78-024.

Descriptors: *Water bodies, *Model studies, *Dispersion, *Water pollution, *Thermal pollution, Hydraulic flow, Probability density, Pollutant concentration, Hydrothermal processes, Diffusion, Laplace's function, Equations, Systems analysis, Numerical analysis.

The problem of water pollution caused by discharge of agricultural, industrial, and municipal effluents containing various pollutants is very real. In some cases, pollution can be linked with the discharge of heated water. Evaluation of the degree of influence of a pollution source on the water environment requires an evaluation of the resultant hydrodynamic and physical process, as well as the chemical-biological processes of self-purification. Mathematical models of water quality have been developed to describe these processes. They are based on the application of hydrodynamic equations of turbulent liquid motion and include equations that describe the mass balance of miscellaneous pollutants as well as heat and oxygen. The major hydrodynamic question is the definition of diffusion coefficients when compiling these equations. A survey has been taken of eight reports which studied separate aspects of the common problem of water pollution. The reports may be conditionally subdivided into three groups; this survey report is accordingly divided into the following three sections: (1) flow in water bodies; (2) hydrothermal processes in water bodies; and (3) convective diffusion. Special attention is given to numerical modeling of these phenomena in shallow water bodies. (See also W79-06166) (Bell Graf-Cornell)

CURRENT MEASUREMENTS IN POSSIBLE DISPERSAL REGIONS OF THE BEAUFORT SEA,
Washington Univ., Seattle. Dept. of Oceanography.
K. Aagaard.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol IX, Transport. p 40-60, October 1978. 9 fig, append. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-67.

Descriptors: *Ocean currents, *Oil spills, *Ocean circulation, Path of pollutants, Baseline studies, Water pollution, Environmental effects, Resources development, Alaska, *Outer Continental Shelf, *Beaufort Sea, Current measurements, Oil transport.

The picture which emerges from the work done on the outer shelf to date is of a regime that is quite energetic over a broad band of sub-tidal frequencies. The mean flow calculated for a sufficiently long period (possibly up to several months) is unquestionably eastward. The flow appears to be steered by the local bathymetry. Although the energetic time scales of the flow are those of synoptic meteorological events, no clear relationship between atmospheric and oceanic events has been shown to date, even in a phenomenological fashion. The implication with respect to the subsurface transport of pollutants and other substances on the outer shelf is that (1) in the mean they will move significant distances eastward along the shelf, and (2) trajectory prognosis would be meaningless at the present level of understanding. GULF OF ALASKA SHELF CIRCULATION,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
J. Schumacher, R. Charnell, S. Hayes, H. Mofjeld, and R. Muench.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol IX, Transport, p 61-213, October 1978. 54 fig, 8 tab, 55 ref, 2 append. NOAA, Outer Continental Shelf Environmental Assessment Program. Boulder, Colorado. RP0000R7120847.

Descriptors: *Ocean currents, *Ocean circulation, *Baseline studies, *Hazards, Oil spills, Water pollution, Environmental effects, Resources development, Alaska, *Outer Continental Shelf, *Gulf of Alaska, *Oil transport, Petroleum development.

Field investigations, begun in Autumn 1974, have and continue to provide data which aids our understanding of hydrographic, current and pressure regimes in the Gulf of Alaska. Many important features have been identified, including: the relation between bottom pressure and velocity; cross-shelf coherence; gyral circulation west of Kayak Island; the pronounced effect of the Alaskan Current inflow through Shelikof Strait; the presence of shelf edge waters in the nearshore regions of troughs; and, a description of flow in Lower Cook Inlet. Further work, primarily intensive data analysis, will focus on understanding these and similar features, and estimating their importance in assessing hazards related to petroleum development. ALASKA NUMERICAL MODELING,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
J. Galt, J. Overland, R. Stewart, C. Pease, and M. Hitchman.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol IX, Transport, p 214-326, October 1978. 31 fig, 10 tab, 13 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. R7120845.

Descriptors: *Mathematical models, *Ocean currents, *Meteorology, *Circulation, Baseline studies, Wind(Meteorology), Environmental effects, Alaska, Oil spills, *Outer Continental Shelf, Oil transport, Northeast Gulf of Alaska(NEGOA).

Numerical modeling of oceanographic and meteorological regimes provides an aide to the understanding of currents and winds in the Gulf of Alaska. Many important components have been developed, including: a diagnostic model for the prediction of surface currents, a regional meteorological model for the prediction of surface winds, and methodologies for simulating the temporal and spatial variations in the velocity fields. Later this

year field data will be interpreted and these parts integrated to give estimates of pollutant trajectories for the region with particular emphasis on NEGOA. The report presents a careful evaluation of the diagnostic model with a formalized approach to the boundary conditions and a restructuring of the model equations. Data sets are identified for applying the diagnostic model to NEGOA. The results of a one dimensional calculation with the regional meteorological model for NEGOA and a system for extrapolating the results to develop typical coastal wind fields are discussed. Results of two methods for arriving at a set of pressure maps which provide a good coverage of the climatology for the Gulf of Alaska are presented. Trajectory model development and schemes for incorporating field data and results from other models into trajectory calculations through an environmental disk system are also discussed. Future work is outlined with the discussion of the current progress on each individual task. (Sinha-OEIS)

BRISTOL BAY OCEANOGRAPHIC PROCESSES (B-BOP),
Washington Univ., Seattle. Dept. of Oceanography.
L. K. Coachman, T. H. Kinder, J. D. Schumacher, and R. L. Charnell.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol IX, Transport, p 327-575, October 1978. numerous fig, tab, ref, 2 append. NOAA, Outer Continental Shelf Environmental Assessment Program. Boulder, Colorado. R7120840.

Descriptors: *Hydrography, *Ocean currents, *Tides, *Hazards, Baseline studies, Oil spills, Water pollution effects, Environmental effects, Resources development, Alaska, *Outer Continental Shelf, *Bristol Bay, Oil transport, Petroleum development.

Field investigations, begun in Autumn 1975, are now beginning to bear fruit and our understanding of the hydrographic and current regimes in Bristol Bay is growing. Many interesting and important features have been identified, including fine structure, fronts, anomalously diminished tidal currents, and an eddy. Further work, primarily requiring intensive data analysis, will focus on understanding these and similar features, and estimating their importance in assessing hazards of petroleum development. (Sinha-OEIS)
W79-06192

STD MEASUREMENTS IN POSSIBLE DISPERSAL REGIONS OF THE BEAUFORT SEA,
Washington Univ., Seattle. Dept. of Oceanography.
K. Aagaard.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol IX, Transport, p 575-590, October 1978. 8 fig. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-67.

Descriptors: *Water pollution, *Path of pollutants, *Dispersion, Salinity, Temperature, Density, Freezing, Baseline studies, Environmental effects, Arctic Ocean, Resources development, Alaska, *Outer Continental Shelf, *Pollutant transport, Beaufort Sea.

Results of the study include: (1) the direct influence of freezing extends far below the local pycnocline, due to the differential movement of waters from a variety of locations seeking their density level; (2) there are considerable year-to-year differences in hydrography and anomalies can persist through several seasons; (3) it seems likely that in the mean there is a net flow of saline water onto the shelf in the lower part of the water column; and (4) the temperature signal of the Bering Sea water is largely erased within a month or two after freeze-up. The major implication of the STD work with respect to the transport and dispersal of pollutants is that at least the outer part of the shelf, e.g., that portion deeper than about 50 m, is an active area even after freeze-up. There is ample evidence both of large-scale motion along the shelf, and of cross-shelf flux and exchange with the Arctic Ocean to the north. (Sinha-OEIS)
W79-06193

LAGRANGIAN SURFACE CURRENT MEASUREMENTS ON THE OUTER CONTINENTAL SHELF,
National Oceanic and Atmospheric Administration, Miami, FL. Atlantic Oceanographic and Meteorological Labs.
D. V. Hansen.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol IX, Transport, p 590-603, October 1978. 7 fig. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Currents(Water), *Circulation, *Path of pollutants, *Oil spills, Baseline studies, Resources development, Environmental effects, *Outer Continental Shelf, *Surface currents, *Oil transport, Trajectories, Gulf of Alaska, Bering Sea, Lagrangian current data.

The objectives of this work unit are to obtain Lagrangian current data for assessment of probable trajectories of oil spills in the Gulf of Alaska and the S.E. Bering Sea using drogued free drifting buoys located several times daily by a satellite positioning system. During the 1977 field season six buoys were deployed S.E. of the Pribilof Islands in the S.E. Bering Sea. These deployments were as successful as those of 1976. The longest surviving buoy has recently terminated transmission after nearly 7 1/2 months of successful operation since May 1977. An average buoy lifetime in excess of 135 days was achieved during this year. It is believed that most of the buoys failed after being caught in the ice at the end of the field year. One buoy grounded on St. George Island less than two months after deployment, and another grounded on St. Paul Island about six months after deployment. Overall, more than 820 days of surface current data were obtained in the region 54 - 59 degrees N, 163 - 178 degrees W. A principal early conclusion that can be drawn is that surface currents in the S.E. Bering Sea are characterized by extensive eddying with several day average current speeds on the order of 20 cm/sec or less. Sustained current speeds of greater than 30 cm/sec are rarely seen, at least during Summer and Fall. The net displacement of water from the region is even more sluggish. Typical long term displacements are on the order of 400 km in 100 days. (Sinha-OEIS)
W79-06194

STUDY OF CLIMATIC EFFECTS ON FAST ICE EXTENT AND ITS SEASONAL DECAY ALONG THE BEAUFORT-CHUKCHI COASTS,
Colorado Univ., Boulder. Inst. of Arctic and Alpine Research.
R. G. Barry.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol IX, Transport, p 604-708, October 1978. 5 fig, 3 tab, 14 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-91.

Descriptors: *Sea ice, *Seasonal, *Baseline studies, Oil pollution, Resources development, Environmental effects, Water pollution, Alaska, Path of pollutants, *Outer Continental Shelf, *Fast ice, *Climatic effects, Beaufort Sea, Chukchi Sea, Petroleum development, Oil transport.

Nearshore ice along Alaska's Beaufort Sea and Chukchi Sea costs undergoes an annual cycle of formation, extension, modification, ablation, and breakup. Many of the processes which contribute to this cycle are poorly understod, although it is generally recognized that meteorological and climatological factors are important influences for ice formation, motion, deformation, ablation, and breakup. This study is attempting to interpret ice characteristics and their time variations from remote sensing data supplemented by aircraft and field observations. This derived information covering both the Beaufort and Chukchi coasts is then compared with concurrent coastal weather conditions and regional atmospheric pressure patterns. Offshore petroleum development may involve temporary operations on the winter fast-ice surface or in the open waters during summer. Alternately, large, ice-resistant structures may be used year-round. An accurate assessment of the best operational modes and of the seasonal distribution of ice hazards requires that the normal patterns and variabilities of fast-ice characteristics and breakup processes be specified. Also, the pathways of pollutants deriving from oil spills or blowouts are dependent to some degree on the season, and, in summer, on relative progression of the breakup. It also seems significant that various faunal populations utilize the coastal environment, above and below the ice and in open water areas. Seasonal and interannual variations in the weather and ice characteristics are important factors affecting the distribution and movements of these populations. (Sinha-OEIS)
W79-06195

A METEOROLOGICAL BASIS FOR LONG-RANGE FORECASTING OF SUMMER AND EARLY AUTUMN SEA ICE CONDITIONS IN THE BEAUFORT SEA,
Colorado Univ., Boulder. Inst. of Arctic and Alpine Research.
J. C. Rogers.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol IX, Transport, p 709-719, October 1978. 2 fig, 6 tab, 8 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Forecasting, *Sea ice, *Meteorology, Baseline studies, Oil spills, Resources development, Environmental effects, Alaska, *Outer Continental Shelf, *Oil transport, Petroleum development, Beaufort Sea, Long-range forecasting.

The beginning of drilling operations and the movement of supplies and resources between Point Barrow and Prudhoe Bay, Alaska, has made an assessment of the Beaufort Sea ice regime imperative. The Beaufort Sea is ice covered approximately nine months of the year. Only between late July and early October (in favorable ice summers) is it possible to safely ship supplies along the coast. In more severe ice summers such as those of 1955 and 1975 shipping can be delayed or halted. The overall results of the study suggest that persistence of monthly air temperature anomalies at Barrow in conjunction with cautious application of periodicities in those temperatures can be successfully used as predictors of the severity or mildness of summertime Beaufort Sea ice conditions. Depending upon user needs these meteorologically based prediction techniques could feasibly used in other aspects of sea ice forecasting, particularly the time of freezeup. (Sinha-OEIS)

MECHANICS OF ORIGIN OF PRESSURE RIDGES, SHEAR RIDGES AND HUMMOCK FIELDS IN LANDFAST ICE,
Alaska Univ., Fairbanks. Geophysical Inst.
L. H. Shapiro, H. F. Bates, and W. D. Harrison.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol IX, Transport, p 720-760, October 1978. 8 fig, 12 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-55.

Descriptors: *Sea ice, *Offshore platforms, *Hazards, *Resources development, Baseline studies, Water pollution, Oil spills, Environmental effects, *Outer Continental Shelf, *Landfast ice, Petroleum development.

All three phases of this project are directly relevant to the design of offshore structures for OCS

development and to the safe conduct of related operations. Potential override by the ice sheet is a recognized hazard in all phases of exploration and development in the offshore area of the Beaufort Sea coast, and the state of the ice during the break-up period makes this a particularly hazardous time. Attempts have been made by industry to develop sensors which can be used to provide early warning of impending ice motion in the vicinity of a structure. The study of ice vibrations in progress under this project may prove to be a relatively simple and inexpensive method for accomplishing this. The results of two studies related to the association of the long period vibrations with high compressive stresses are presented. In addition, a series of measurements of the coefficients of both static and kinetic friction between ice and beach gravel were made, and these results have been used to calculate the stresses involved in driving the ice sheet up the beach at Barrow in July 1975. The results of these calculations are comparable to the forces required to form the ridges along the beach. The latter forces were calculated from a modified version of the kinematic model of pressure ridging and these results are also given. (Sinha-OEIS)

MORPHOLOGY OF BEAUFORT, CHUKCHI AND BERING SEAS NEAR SHORE ICE CONDITIONS BY MEANS OF SATELLITE AND AERIAL REMOTE SENSING,
Alaska Univ., Fairbanks. Geophysical Inst.
W. J. Stringer, S. A. Barrett, and L. Schreurs.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 1-220, October 1978. 102 fig, 16 ref, append. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-55.

Descriptors: *Sea ice, *Hazards, *Offshore platforms, *Oil pollution, Baseline studies, Resources development, Environmental effects, Alaska, Coasts, Remote sensing, *Outer Continental Shelf, *Petroleum development, Shore ice, Chukchi Sea, Beaufort Sea, Bering Sea.

Based on the combined seasonal morphologies, a zonal analysis of potential hazards related to offshore petroleum development has been made for the Chukchi and Beaufort seas. The hazards addressed are: safety of field personnel performing offshore geologic reconnaissance, large-scale displacement or deformation of fast ice sheet, the probability of formation of large ice ridge systems which could bring large forces to bear on offshore structures, and the possible fate of an under-ice oil spill. The general conclusion is that near shore sea ice behavioral patterns are similar from year to year thereby yielding some predictability in terms of offshore sea ice hazards to oil and gas development. The implications are that geographical zones of different design and construction criteria can be established in the offshore areas taking into consideration the probability of damage to the structure by adverse ice conditions and the relative risk imposed to the adjacent ecosystems. (Sinha-OEIS)

DEVELOPMENT OF HARDWARE AND PROCEDURES FOR IN-SITU MEASUREMENT OF CREEP IN SEA ICE,
Alaska Univ., Fairbanks. Geophysical Inst.
L. H. Shapiro, and E. R. Hoskins.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 221-259, October, 1978. 16 fig, 13 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-55.

Descriptors: *Sea ice, *Hazards, *Offshore platforms, *On-site tests, *Resources development, Baseline studies, Pollution, Water pollution, Environmental effects, Alaska, *Outer Continental Shelf, Petroleum development.

Any permanent or semi-permanent structure located off the Arctic Coast of Alaska must content with the hazard that sea ice presents to its stability. The extent of this hazard depends on three basic parameters. First, the strength of the structure itself, with respect to its ability to withstand forces of a given magnitude. Second, the geometry of the interaction between the structure and the surrounding ice, including the state of bonding between the two and, finally, the strength of the ice, which determines the maximum force that the ice can sustain in the mode of failure which the structure is designed to induce. The first two of these parameters are determined largely by the third, the strength of the ice, and it is to this problem that the project is directed. A field program is currently in progress in which it is intended to test about 100 samples of ice with dimensions of 30 x 30 x 60 cm in uniaxial compression. Tests are being conducted at constant load to examine creep and creep-rupture behavior, and at constant loading rates to determine the strength. The methods used and results to date are described. CIRCULATION AND WATER MASSES IN THE GULF OF ALASKA,
Alaska Univ., Fairbanks. Inst. of Marine Science.
D. T. Royer.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 292-323, October 1978. 4 fig, 1 tab, 2 append. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-56.

Descriptors: *Circulation, *Water masses, *Baseline studies, *Path of pollutants, Resources development, Pollution, Environmental effects, *Outer Continental Shelf, *Oil transport, Petroleum development, Gulf of Alaska.

The most important result of this year's research is the separation of precipitation and wind stress effects on the coastal dynamic height, and hence the coastal circulation. There is evidence of eddies and other perturbations in the circulation that are both temporary and permanent. The wind stress effects the circulation, but the exact mechanism or magnitude is not known. Besides the discovery of the precipitation effect, the shelf circulation appears to consist of a coastal current and a shelf break current with weak flow between them. There is some evidence for baroclinic flow into Prince William Sound. There is also evidence that fresh water runoff affects the transport in the Alaska Stream and that maybe this is a boundary between the coastal waters and oceanic waters. We have found that the geostrophic currents, as determined from CTD/STD measurements, correspond to results of the drifters. (Sinha-OEIS)

Descriptors: *Winds, *Currents, *Oil spills, *Path of pollutants, Resources development, Baseline studies, Environmental effects, Alaska, *Outer Continental Shelf, Cook Inlet, Wind effects, Near shore meteorology, Petroleum development.

This study concentrates on the Lower Cook Inlet region which is the most vulnerable to industrial development. Research into the oceanic circulations in this enclosed region, reveals a chaotic unpredictable pattern, to a large extent controlled by the wind stress history over the water. This ability of the wind to control the current field, especially the near surface currents, coupled with the direct frictional coupling of the wind to the surface oil, confirms the importance of a knowledge of the wind field. Knowledge of the predictability of the winds in various regions is important for any shipping, platform service operations or aircraft operations, not to mention oil spill trajectory prediction. Thus, any areas which do not yield to existing forecast procedures, must be delineated. Either new forecasting techniques need to be developed, or direct telemeterins measurements must be made to properly specify the winds in these regions. The results of research thus far are summarized in five appendices to this report. (Sinha-OEIS)

MODELING OF TIDES AND CIRCULATIONS OF THE BERING SEA,
Rand Corp., Santa Monica, CA.
J. J. Leendertse, and S. Liu.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 569-579, October 1978. 18 fig. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-6-022-35249.

Descriptors: *Models, *Tides, *Circulation, Meteorology, Baseline studies, Resources development, Path of pollutants, Environmental effects, Alaska, *Outer Continental Shelf, Bering Sea, Petroleum development.

In the graphical system, the facility for vertical plots is extended to all variables. Computed time histories at selected depths up to six series can now be plotted on a single frame. To reduce compiling and storage costs, the graphic system consists of a fixed and a variable part, thus improving the efficiency of the storage usage. Computational subroutines in the program are independent of the model's dimensions and need not be recompiled for each case. A graphical system for analyzing tidal constituents in the modeled area determined from the computed water level data by means of Fourier transformation for each frequency considered in the model are being developed. COASTAL METEOROLOGY OF THE ALASKAN ARCTIC COAST,
Washington Univ., Seattle. Div. of Marine Resources.
E. Leavitt.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 580-606, October 1978. 15 fig, 3 tab, 12 ref, append. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-67.

Descriptors: *Winds, *Meteorology, *Oil spills, Baseline studies, Resources development, Water pollution, Environmental effects, Alaska, *Outer Continental Shelf, *Oil trajectories, Petroleum development.

Given the strong correlation between winds measured at wide separations along the coast, it would be possible to provide winds for predicting coastal current trajectories with only a few measurement points. This would be more accurate than calculating the surface wind from the geostrophic wind; especially given the possibility of mesoscale phenomena such as the sea breeze and the necessity for simultaneously measuring boundary layer stratification. However, this must be qualified if winds are required further than 20 or 30 km offshore or inland from the coast. The relative ease with which pressure sensor equipped data buoys can be

set out on the ice, or for that matter inland from the coast, suggest their use in the latter case. The wind measurements along the coast could then serve as input to the calculation of surface winds from the pressure field. Such a combination of wind and pressure measurement stations could be set up and maintained for a relatively small expenditure, providing an excellent data base for studies of current (or oil spill) trajectories. CHARACTERIZATION OF THE NEARSHORE HYDRODYNAMICS OF AN ARCTIC BARRIER ISLAND - LAGOON SYSTEM,
Alaska Univ., Fairbanks. Geophysical Inst.
J. B. Matthews.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 607-627, October 1978. 7 fig, 16 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colo. 03-5-022-56.

Descriptors: *Hydrodynamics, *Food chains, *Circulation, *Baseline studies, *Water pollution effects, Arctic Ocean, Water temperature, Salinity, Turbulence, Food chains, Resources development, Environmental effects, Alaska, Obstruction to flow, *Outer Continental Shelf, *Nearshore processes, Petroleum development.

Physical circulation and processes occurring in the nearshore regions of the Beaufort Sea have a primary influence on the biological processes. Currents and water temperature, salinity and turbulence have a direct effect on organisms at the base of the food chain. These in turn affect the higher organisms such as fish and birds which are vulnerable to oil related impacts along the Alaskan north slope coast. The system is primarily driven in the open water season by meteorological events, water from the rivers appears to stay nearshore and move in a generally westward direction. Causeways and other solid structures appear to modify the longshore flow. Flushing times during strong winds and storms could be of the order of a few days and surface drifters reached Point Barrow from Purdhoe Bay in less than a week. Implications for oil and gas developments are that, during the open water season, spilled oil could be distributed over the whole coastline in about one week if it coincided with the frequent storm conditions. Preliminary results suggest that islands, causeways and other obstructions to longshore flow need to be designed with consideration for allowing free passage of the brackish river waters near the mainland shores. SEDIMENT CHARACTERISTICS, STABILITY, AND ORIGIN OF THE BARRIER ISLAND-LAGOON COMPLEX, NORTH ARCTIC ALASKA,
Alaska Univ., Fairbanks. Inst. of Marine Science.
A. S. Naidu.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 628-686, October 1978. 6 fig, 9 tab, 21 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-56.

Descriptors: *Exploitation, *Ecosystems, *Barrier islands, *Lagoons, *Environmental effects, Resources development, Baseline studies, Sediments, Oil spills, Alaska, *Outer Continental Shelf, North Slope, Beaufort Sea, Petroleum development.

The sedimentological studies are part of a larger interdisciplinary research effort to study the physicochemical and biological processes operative in the barrier island-lagoon ecosystem. It also entails establishment of an ecosystem model which can be put to use in predicting possible impacts resulting from both petroleum exploration and exploitation activities in the barrier island-lagoon complex of the Beaufort Sea coast. As a consequence of the OCS petroleum and gas development activities, the nearshore and the open shelf ecosystem of the Beaufort Sea is bound to be subjected to some degree of anthropogenic perturbations. The industrial activities which most likely will be introduced in this area include the construction of artificial islands and causeways for the use of drilling operations and docking facilities, dredging for maintaining navigation, and the exploitation of gravel and sand deposits from several possible sources as construction and fill materials. Already significant changes in the size distributions, benthic and chemical attributes of bottom sediments, as well as on the nearshore bathymetry have been recognized in the vicinity of Prudhoe Bay, consequent to the building of the new ARCO causeway. If the response of the physical environment and biological resources of the area to such changes can be properly assessed, or even predicted, it is quite possible that effective measures can be developed to protect or enhance existing resources. THE ENVIRONMENTAL GEOLOGY AND GEOMORPHOLOGY OF THE BARRIER ISLAND - LAGOON SYSTEM ALONG THE BEAUFORT SEA COASTAL PLAIN FROM PRUDHOE BAY TO THE COLVILLE RIVER,
Alaska Univ., Fairbanks. Dept. of Geology.
P. J. Cannon, S. E. Rawlinson, M. G. Moore, and J. Reuben.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 687-731, October 1978. 6 fig, 5 tab, 5 map. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-56.

Descriptors: *Geomorphology, *Detritus, *Baseline studies, Environmental effects, Barrier Islands, Lagoons, Resources development, Alaska, *Outer Continental Shelf, Environmental geology, Beaufort Sea, Petroleum development.

The purpose is to provide quantitative and qualitative data for assessing the environmental impact of development within the Simpson Lagoon area. Before environmental impact assessment is possible, however, past and present natural processes and conditions of the barrier island-lagoon system must be determined. Specific modeling requirements from the geomorphology subgroup are the volume and mass of detrital material introduced into Simpson Lagoon by shoreline erosion and from fluvial injection. Natural geological conditions and processes are best indicated by the individual landforms and/or the landform assemblages of the area. Recognition of these landforms and knowledge of the geomorphic processes by which they formed, enables the prediction of future changes, both natural and man-induced. Results of this investigation to date are presented in this report. (Sinha-OEIS)

OCEANOGRAPHIC PROCESSES IN A BEAUFORT SEA BARRIER ISLAND-LAGOON SYSTEM: NUMERICAL MODELING AND CURRENT MEASUREMENTS,
Texas A and M Univ., College Station. Dept. of Oceanography.
J. C. H. Mungall, R. W. Hann, Jr., D. J. Horne, R. E. Whitaker, and C. E. Abel.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 732-830, October 1978. 20 fig, 1 tab, 6 ref, append. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-7-022-35182.

Descriptors: *Currents, *Barrier islands, *Lagoons, *Models, *Winds, *Resources development, Environmental effects, Baseline studies, Water pollution, Drilling, Oil pollution, Alaska, *Outer Continental Shelf, Beaufort Sea, Transport model, Petroleum development.

Simpson Lagoon, the principal study area and considered a typical example of an arctic barrier island lagoon system, lies some 10 miles to the west of Prudhoe Bay. The region will be subject to development should exploratory drilling occur offshore in the wake of the initial success of the Prudhoe Bay oilfield. One of the most likely points of impact will be the barrier islands, since they constitute convenient locations for offshore drilling. The modeling part of the investigation concentrated around the development of a two-dimensional vertically-integrated transport model and a three-dimensional multi-level model--both having the same 1 km x 2 km grid spacing and the same bottom topography. Findings from the modeling are that exchange rates and currents vary primarily with the angle between the wind and the lagoon axis (regardless of whether the wind is westerly or easterly) and of course with wind speed. Any discussion of the implications of these preliminary findings on OCS oil and gas development would be premature at this time, since any such implications are primarily related to possible biological impacts. OIL SPILL VULNERABILITY OF THE BEAUFORT SEA COAST,
South Carolina Univ., Columbia. Dept. of Geology.
D. Nummedal, I. A. Fischer, and J. S. Knoth.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 853-859, October 1978. 2 fig, 2 tab, 7 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Geomorphology, *Barrier islands, *Oil spills, *Sediment transport, *Path of pollutants, Baseline studies, Environmental effects, Resources development, Water pollution, Alaska, *Outer Continental Shelf, *Oil transport, Beaufort Sea.

Project objectives were to characterize the morphology of the barrier islands and the mainland shoreline and to assess the retention potential for spilled hydrocarbons within the coastal environment. Measurements of littoral process variables along the mainland and island shores of the Beaufort Coast of Alaska are much too sparse to permit an evaluation of the spatial and temporal variations of beach sediment transport. Data presented in this report, however, are suggestive of a typical annual net transport rate of about 100,000 cubic meters to the west along the seaward beaches of the Beaufort barriers. The rate of longshore movement of coarse-grained beach material (sand and gravel) is found to range from essentially zero up to 4100 cubic meters per day. (Sinha-OEIS)

NORTON SOUND/CHUKCHI SEA OCEANOGRAPHIC PROCESSES (N-COP),
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
J. D. Schumacher, R. D. Muench, T. H. Kinder, L. K. Coachman, and R. L. Charnell.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 860-928, October 1978. 25 fig, 1 tab, 2 append. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. R7120840.

Descriptors: *Hydrography, *Tides, *Currents, *Water pollution, Baseline studies, Resources development, Environmental effects, Oil pollution, Alaska, *Outer Continental Shelf, *Oil transport, Petroleum development.

The general objective was to relate oceanic advective and diffusive processes to potential pollution problems due to OCS petroleum development. Net flow through Bering Strait was northward throughout the winter of 1976-77 based upon records from moored current meters in Bering Strait and southeast of St. Lawrence Island. There was an overall factor of 2 decrease in kinetic energy density of northern Bering Sea currents at the time of ice formation, as recorded by the overwinter current meters. Tidal currents were extremely complex in the northern Bering Sea and Norton Sound regions. A mixed tide southeast of St. Lawrence Island gave way to a primarily diurnal tide in Norton Sound off Nome. In Bering Strait, there was no diurnal tidal signal and the semidiurnal signal was extremely small. Two summer hydrographic surveys of Norton Sound revealed a pronounced two-layered structure: a cold, saline near-bottom layer was overlain by a warmer, lower salinity upper layer. The lower layer, a remnant of the preceding winter's convective regime (surface cooling and ice formation) persisted throughout the summer. The overall distribution of temperature and salinity suggested a sluggish horizontal circulation in the eastern sound with a weak cyclonic circulation in the western portion; circulation was weaker in the lower than in the upper layer, and was negligible in the lower layer in the eastern sound. THE INTERACTION OF OIL WITH SEA ICE IN THE ARCTIC OCEAN,
Washington Univ., Seattle. Dept. of Oceanography.
S. Martin.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XI, Hazards, p 8-10, October 1978. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-67.

Descriptors: *Sea ice, *Hazards, *Oil spills, *Baseline studies, Laboratory tests, Resources development, Environmental effects, Alaska, *Outer Continental Shelf, Grease ice, Pancake ice, Oil transport.

The major laboratory effort is to develop a model for oil entrainment in grease and pancake ice; forms of ice which are important in the lee shore regions of Norton and Kotzebue Sound. Also, the laboratory pancake work is a rough model of how oil might spread in a field of larger floes. The work suggests that oil will collect in the grease ice at the point of transition from a liquid to a solid. In lease areas such as Norton and Kotzebue Sound, satellite photographs show that the grease ice forms in long larrow Langmuir-like plumes parallel to the wind. These plumes absorb the energy of the bi-directional wind-wave field. It is suspected from the experiments that oil spilled in these areas will be driven into the Langmuir plumes by the circulation, and collect in bands parallel to the grease ice. (Sinha-OEIS)

DYNAMICS OF NEAR-SHORE ICE,
Army Terrestrial Sciences Center, Hanover, NH.
A. Kovacs, and W. Weeks.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XI, Hazards, p 11-22, October 1978. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 01-5-022-1651.

Descriptors: *Sea ice, *Dynamics, *Hazards, *Engineering, Offshore platforms, Baseline studies, Resources development, Environmental effects, Water pollution, *Outer Continental Shelf, Fast ice, Nearshore ice, Petroleum development.

A knowledge of motion, deformation and physical characteristics of both the near-shore pack ice and the fast ice is essential to adequately designing and estimating the hazards associated with a variety of engineering options that may be considered for offshore operations in the near coastal areas of the Beaufort and Chukchi Seas. This program contributed directly to the solution of this general class of engineering problems in that it provides much of the geophysical and engineering data upon which sound engineering and regulatory decisions can be made. Detailed quantitative information on the movement and deformation of both the near-shore pack of ice and the fast ice along the coast of the Beaufort Sea has been obtained. Studies have also been carried out on the nature of the ridge systems located near the edge of the fast ice, on lateral variations in the thickness of first and multiyear ice, and on the internal structure of sea ice. The Narwhal Island area that is being studied is a portion of a coming lease sale, possesses favorable geologic structures and is a natural extension of the known Prudhoe Bay field. Basic information is provided by the remote sensing program on the distribution of ice types and features and in particular ridges that will be required as one aspect of a risk analysis for the construction of an offshore drilling platform sited on the edge of the Arctic Ocean. DYNAMICS OF NEAR SHORE ICE,
Washington Univ., Seattle. Polar Science Center.
R. S. Pritchard.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XI, Hazards, p 39-49, October 1978. 1 fig, 1 tab. NOAA, Outer Continental Shelf Environmental Assessment Program. Boulder, Colorado. 03-50-022-67.

Descriptors: *Sea ice, *Ice cover, *Path of pollutants, Oil spills, Resources development, Baseline studies, Environmental effects, Water pollution, Alaska, *Outer Continental Shelf, *Ice motion, *Oil transport, Chukchi Sea, Beaufort Sea, Petroleum development, Near shore ice.

Chukchi Sea ice motions are presented from March to September 1977, and the deployment of additional buoys in March 1978 is discussed. Observations of ice motions are relevant to problems of petroleum development for two broad reasons: (1) the ice cover will serve as a carrier of any petroleum products spilled in either the Beaufort or Chukchi Sea so that ice trajectories serve as the first estimate of the paths to be taken by the oil; and (2) the ice motion is an observable quantity that may be compared with simulated values to test the performance of an ice dynamics model which in turn may be used to determine a range of ice motions in a variety of environmental conditions. The ice motion data in the Chukchi Sea (both area wide and over the continental shelf) is particularly important because of its proximity to the Bering Sea which is a rich ecosystem that must be protected from pollution because of its high biological productivity. MARINE ENVIRONMENTAL PROBLEMS IN THE ICE COVERED BEAUFORT SEA SHELF AND COASTAL REGIONS,
Geological Survey, Menlo Park, CA. Pacific-Arctic Branch of Marine Geology.
P. Barnes, and E. Reimnitz.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XI, Hazards, p 148-299, October 1978. NOAA, Outer Continental Shelf Environmental Assessment Program. Boulder, Colorado. RK6-6074.

Descriptors: *Sea ice, *Hazards, *Permafrost, *Pipelines, *Drilling, Baseline studies, Resources development, Environmental effects, Oil pollution, Pollution, Alaska, *Outer Continental Shelf, Beaufort Sea, Petroleum development.

The marine geology and modern sedimentary environment off arctic Alaska is studied with emphasis on rates and processes and in particular the phenomena involving ice and its unique influence on the shelf and inshore environment. The character of the arctic continental shelf and coastal area, with its year round and seasonal sea ice and with it permafrost, faces the developer with many special problems. The interaction of the arctic shelf with the arctic pack ice takes the form of ice gouging and the formation of a large stamukhi zone each winter. Oil drilling and production during the next several years will probably not extend into the stamukhi zone seaward of the seasonal fast-ice zone. Of critical concern are the ice gouge and strudel scour effects on structures and pipelines. A similar emphasis has been taken by the Canadian Beaufort Sea Project in their more advanced state of knowledge and readiness to lease their outer continental shelf lands. The offshore drilling operation may encounter permafrost which could be substantially altered during the process of pumping hot oil up to the sea floor or along the sea floor in gathering and transportation pipelines. DISTRIBUTIONS OF GRAIN SIZE, TOTAL CARBON, HEAVY AND LIGHT MINERALS, CLAY MINERALOGY, AND INORGANIC GEOCHEMISTRY, OUTER CONTINENTAL SHELF, SOUTHERN BERING SEA,
Geological Survey, Menlo Park, CA.
J. V. Gardner, T. L. Vallier, W. E. Dean, K. A. Kvenvolden, and G. D. Redden.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XI, Hazards, p 300-383, October 1978. 32 fig, 7 tab, 30 ref, 2 append. NOAA, Outer Continental Shelf Environmental Assessment Program. Boulder, Colorado. RK6-6074.

Descriptors: *Sediment distribution, *Geochemistry, *Baseline studies, *Hazards, Minerals, Carbon, Environmental effects, Resources development, Alaska, *Outer Continental Shelf, Bering Sea, St. George Basin, Petroleum development.

The U.S. Geological Survey and BLM initiated a cooperative program to evaluate potential geologic hazards on the outer continental shelf area of the southern Bering Sea. The principle objectives of this study are to describe the distribution and types of surface sediment, and the processes effecting these distributions. The region covered in this study centers on the St. George Basin and covers an area bounded by the Aleutian Islands and Alaska Peninsula on the southeast, the shelf break at a depth of about 170 m on the southwest, the Pribilof Islands on the north and the 100 m isobath on the northeast. The present-day continental shelf of the southern Bering Sea is extremely flat and broad. Bottom gradients typically are much less than 0.25 degrees (1:13,000) and the large rivers that feed sediment into the Bering Sea, the Yukon, Kuskokwim, Kvichak, and to a lesser extent the Nushagak Rivers, are all over 500 km away from the St. George Basin area. Sediment is transported from these rivers into Bristol Bay but has almost no opportunity to be advected to the St. George Basin area because of the extremely low topographic gradient and insufficient watermass movement. Consequently it is believed that sediments are not presently being deposited on the outer continental shelf of the southern Bering Sea. This implies that all of the surface sediments are relict and that the sediments are Late Quaternary. (Sinha-OEIS)
W79-06218

'UKON DELTA COASTAL PROCESSES 'TUDY,
Houston Univ., TX. Dept. of Geology.
V. R. Dupre.
n: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XI, Hazards, p 384-446, October 1978. 19 fig, 2 tab, 44 ef. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Coasts, *Hazards, *Ice, *Geomorphology, Oil spills, Permafrost, Environmental effects, Baseline studies, Resources development, Sediment transport, Alaska, *Outer Continental Shelf, *Coastal processes, Yukon Delta, Petroleum development.

The Yukon delta is strongly influenced by the effects of ice in the ground, on the river, and offshore. Several of the major depositional environments of the Yukon delta appear to be restricted to ice-dominated coastlines. Similarly, the seasonality of coastal processes is dominated by the effects of ice throughout much of the year, thus a careful study of this region may provide insights into sedimentary processes and geologic hazards in other ice-dominated coastal zones as well. The siting of offshore facilities must take into account the mobility and deformation of seasonal pack ice, the extent and variability of shorefast ice, the probability of offshore permafrost, and the possible effects of altering offshore bathymetry in changing coastal stability. In addition, the evaluation of possible oil spills must take into account not only the dominant northward drift of water and suspended sediments, and the local and seasonal variability of current patterns, but also the role of sub-ice channels in affecting bedload transport. The selection of shoreline sites must take into account the present coastal stability, including the possibility of erosion associated with major storm surges. The effects of shorefast ice over half of the year must also be considered as well as the heterogeneity of the shoreline in determining oil spill vulnerability. (Sinha-OEIS)

EARTHQUAKE ACTIVITY AND GROUND SHAKING IN AND ALONG THE EASTERN GULF OF ALASKA,
Geological Survey, Menlo Park, CA. Office of Earthquake Studies.
C. Stephens, K. A. Fogleman, and J. C. Lahr.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XI, Hazards, p 447-474, October 1978. 9 fig, 20 ref, append. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Hazards, *Earthquakes, *Baseline studies, Resources development, Environmental effects, Alaska, Oil spills, *Outer Continental Shelf, Gulf of Alaska, Petroleum development, Ground shaking.

The objective of this research is to evaluate the hazards associated with earthquake activity in the eastern Gulf of Alaska and adjacent onshore areas. These hazards may pose a threat to the safety of petroleum development. The current seismicity does not necessarily reflect the locations of large historical earthquakes. Large temporal variations in the rate of seismic activity have also been observed. Continued seismic monitoring will no doubt reveal other areas of activity and delineate other active geologic structures. Three earthquakes which occurred at the turn of the last century resulted in uplift of up to 14 meters between Cape Yakutaga and Yakutat Bay. Another onshore earthquake such as one of these or a great earthquake associated with low-angle oblique underthrusting of the sea floor beneath the continental shelf would be accompanied by strong ground shaking throughout much of the eastern Gulf of Alaska, possibly from Cross Sound to Kayak Island, and could trigger tsunamis, seiches, and submarine slumping, any of which could be hazardous to offshore and coastal structures. (Sinha-OEIS)

SEISMIC AND VOLCANIC RISK STUDIES -- WESTERN GULF OF ALASKA,
Alaska Univ., Fairbanks. Geophysical Inst.
H. Pulpan, and J. Kienle.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol. XI, Hazards, p 475-570, October 1978. 15 fig, 5 tab, 6 ref, 3 append. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Earthquakes, *Volcanoes, *Hazards, Alaska, Baseline studies, Resources development, Environmental effects, Oil pollution, *Outer Continental Shelf, *Gulf of Alaska, Petroleum development.

This research was designed to determine the seismicity of the lower Cook Inlet, Kodiak Island, and the Alaska Peninsula and to evaluate the seismic risk to onshore and offshore development. Annual service, routine maintenance, and operation of the regional seismic network of 25 seismic stations constituted the largest portion of the field and laboratory activities. A fairly comprehensive assessment of the hazard associated with Augustine Volcano is provided, based upon both historical data and detailed studies in connection with the 1976 eruption. A similar, preliminary assessment is provided for the volcanic risk associated with Redoubt Volcano. (Sinha-OEIS)

BENTHOS - SEDIMENTARY SUBSTRATE INTERACTIONS,
Alaska Univ., Fairbanks. Inst. of Marine Science.
C. M. Hoskin.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol. XII, Hazards, p 1-43, October 1978. 32 fig, 5 tab, 8 ref. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-56.

Descriptors: *Benthos, *Bottom sediments, Distribution, Water pollution, Baseline studies, Environmental effects, Resources development, Alaska, Particle size, *Outer Continental Shelf, Bering Sea, Petroleum development.

The main objective of the Bering Sea work was to determine relationships between the grain size mode of bottom sediment and distribution and abundance of the macrobenthos. Largest total number of individuals on a unit area basis occurred for stations having grain size modes of fine sand with smaller numbers of individuals at stations having coarser or finer sediment. Lowest total wet weight per square meter was found in these fine sand sediments, with larger weights of macrobenthos tending to occur at stations with coarser or finer sediment. It appears that the larger number of small individuals at fine sand stations is the result of current action. Particle size is only one of many parameters that control the distribution and abundance of benthic organisms. Careful consideration should be given to obtaining data for total organic carbon and the main components - protein, carbohydrate and lipid, to aid in characterizing the quality of organic carbon as food for the benthos. SHALLOW FAULTING, BOTTOM INSTABILITY, AND MOVEMENT OF SEDIMENTS IN LOWER COOK INLET AND WESTERN GULF OF ALASKA,
Geological Survey, Menlo Park, CA.
M. A. Hampton, and A. H. Bouma.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XII, Hazards, p 44-187, October 1978. 11 fig, 11 tab, 9 ref, 8 append. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Sediment transport, *Path of pollutants, *Tectonics, *Faults(Geologic), *Hazards, Baseline studies, Resources development, Environment effects, Water pollution, Alaska, *Outer Continental Shelf, Gulf of Alaska, Petroleum development.

Environmental geologic investigations in Lower Cook Inlet and the western Gulf of Alaska were continued in 1977 with seismic profiling, side scan sonar, bottom sampling and underwater TV and camera the prime activities. Based on the 1976 reconnaissance study certain geologic phenomena were concentrated on that may pose a problem to development and need detailed studies before conclusions can be drawn. On the Kodiak shelf, the principal geo-environmental concerns are related to sediment distribution and movement, and to the structural-tectonic setting. Objectives, based on this premise, have been to determine sediment dispersal patterns across the shelf, to enable prediction of pollutant transport routes and storage sites, and to study the movement history of seafloor faults to determine which ones have recently been active and which have not. In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XII, Hazards, p 187-307, October 1978. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Hazards, *Faults(Geologic), *Sediment transport, *Gases, *Deposition, Storm surge, Currents(Water), Erosion, Path of pollutants, Water pollution, Resources development, Environmental effects, Ice, Alaska, *Outer Continental Shelf, *Bering Strait, Thermogenic gas, Biogenic gas, Petroleum development, Ice gouge.

Environmental evaluation of geologic phenomena in northern Bering Sea indicates faulting, ice gouging, bottom currents, storm surges, and gas-charged sediment pose potential problems to development of offshore resources. Potentially unstable near-surface sediment results from apparent thermogenic gas charging in a local area 40 km south of Nome and from a wide region of biogenic gas charging in north central Norton Sound. Geophysical, geotechnical, and geochemical evidence indicate that hydrocarbon gases of subsurface, thermogenic origin apparently migrate into the near-surface sediment along fault zones 30-40 km south of Nome. Gas migration from the subsurface accumulation to the surface sediment is indicated by smaller zones of reflector terminations observed in high-resolution profiles and more rapid penetration of the vibracorer in sediment at sites of surface acoustic anomalies. Any artificial structures penetrating the apparent large gas accumulation at 100 m or associated faults with gas-charged sediment may provide direct avenues for uncontrolled gas migration to the sea floor. Such structures also may encounter reduced bearing capacity in this gas-charged substrate. Present knowledge suggests that the offshore region surrounding the Yukon Delta and eastern Bering Strait areas have the combination of the most severe geologic hazards. Faulting and current scour are most intense near Bering Strait. Ice gouge, bottom-current scour and

storm surge activity are all intense over a wide area around the shallow prodelta area. Apparent gas cratering occurs throughout north central Norton Sound. (Sinha-OEIS)

SEDIMENT TRANSPORT IN NORTON SOUND - NORTHERN BERING SEA, ALASKA,
Geological Survey, Menlo Park, CA.
D. A. Cacchione, and D. E. Drake.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XII, Hazards, p 308-450, October 1978. 27 fig, 3 tab, 3 append. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Hazards, *Path of pollutants, *Sediment transport, *Resources development, Oil spills, Baseline studies, Environmental effects, Alaska, *Outer Continental Shelf, *Oil transport, Bering Sea, Norton Sound, Petroleum development.

A multi-faceted investigation of sediment dynamics in Norton Sound and other sections of the Northern Bering Sea was conducted to define the principal pathways and mechanisms of bottom and suspended materials transport during the past two years. This research is extremely pertinent to two major impact areas of petroleum development in the marine environment: transport of materials including pollutants; and hazardous sea floor conditions produced by erosion caused by currents and waves. Oil that is absorbed by the fine suspended organic and inorganic material and that is mixed into the bottom sediments will be transported by the regional mean currents. The higher frequency currents such as tidal flow and surface wave-induced currents add local complications to the transport effects. The ability to predict accurately the movements of pollutants in the sea is strongly dependent on our knowledge of local transport processes. Specific geographic regions, like Norton Sound, will have unique aspects to the mechanisms which control the paths and amounts of material that is moved. It can now be demonstrated that storms play a major part in the transport of sediment in Norton Sound. Preliminary results show that ice transport of sediment may be highly significant in the Norton Sound area. (Sinha-OEIS)

SEISMOTECTONIC STUDIES OF NORTHEAST AND WESTERN ALASKA,
Alaska Univ., Fairbanks. Geophysical Inst.
N. N. Biswas, and L. Gedney.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XII, Hazards, p 575-619, October 1978. 10 fig, 5 tab. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-55.

Descriptors: *Hazards, *Earthquakes, *Structural engineering, Seismic studies, Exploration, Deformation, Oil pollution, Resources development, Baseline studies, Environmental effects, Alaska, Pipelines, *Outer Continental Shelf, Petroleum development, Beaufort Sea, Hydrocarbons, Icequakes.

The analysis of the seismic data gathered to date shows that, on the eastern part of Beaufort Sea shelf, the area north of Barter Island is subject to earthquakes in the magnitude range of from 5 to 6. During the exploration and development phases of the proven hydrocarbon reserves in this area, one of the design criteria for structures should be to withstand ground vibrations corresponding to those from a shallow earthquake (less than 20 km) of at least magnitude 6.0. Linear structures, like pipelines, used for transportation of oil or gas through the eastern part of the Brooks Range and the Chandalar and Yukon River basins should take into account the possibility of ground dislocations, perhaps by a significant amount over a period of time, at points of major mapped fault crossings. In the western part of Alaska, around the Seward Peninsula, analysis of the data gathered to date indicates a higher level of seismisity than was recognized prior to this study. This phenomenon appears to be common to both offshore and onshore areas. Further, consideration of the magnitudes of larger earthquakes indicates that this area is seismically more active than northeast Alaska. Some efforts were directed to investigate icequakes. The results show that fracturing of landfast ice sheets under meteorological instability can be effectively detected by seismic methods. (Sinha-OEIS)

A GEOGRAPHIC BASED INFORMATION MANAGEMENT SYSTEM FOR PERMAFROST IN THE BEAUFORT AND CHUKCHI SEAS,
Colorado Univ., Boulder. Institute of Arctic and Alpine Research.
M. Vigdorchik.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol XIII, Data Management, p 77-306, October 1978. Chiefly maps. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 3-7-022-35127.

Descriptors: *Permafrost, *Maps, *Basic data collections, Baseline studies, Geography, Environmental effects, Water pollution effects, Resources development, *Outer Continental Shelf, *Information management, Beaufort Sea, Chukchi Sea.

This report includes two independent parts corresponding to the two principal objectives of the work. The first principal objective is to develop a computerized system to aid prediction of the distribution and characteristics of offshore permafrost. Development of this system involves (1) the gathering and study of all the source data about direct and indirect indicators of permafrost in the given area (depth, temperature and salinity of water, topography, bottom deposits, ice conditions, etc.) and (2) the compilation of the derived source ma and, subsequently, construction of candidate ar maps for submarine permafrost in the Beaufort a Chukchi seas. The second objective is to underta a comprehensive review and analysis of past a current Soviet literature on subsea permafrost a related natural processes. The available materi related to problems of submarine permafrost orig and development were given in the Quarterly R ports in 1977; this annual report gives a sho summary of these materials. Descriptors: *Data processing, *Quality contro Basic data collections, Baseline studies, Water po lution effects, Alaska, Environmental effects, R sources development, *Outer Continental Shel *Data management, Petroleum development.

Data sets received during the first few months o the year were used to establish the range and typ of validation procedures which were necessary Such procedures were in place by the secon quarter, and have been continually refined base on experience gained from processing additiona data. Improvements were made in the approac and in the types and appearance of the validatio procucts CODEPULL and LOGLIST. A produc developed during the second and third quarte presents a report summarizing the status of eac data set being processed. A copy of this repor FOSREPT, is enclosed and shows the status of al data received during the past year. (Sinha-OEIS
W79-06233

ACUTE TOXICITY OF COPPER TO SOM FISHES IN HIGH ALKALINITY WATER,
Illinois State Water Survey, Urbana.
D. Richey, and D. Roseboom.
Available from the National Technical Informatio Service, Springfield, VA 22161 as PB-294 923 Price codes: A03 in paper copy, A01 in microfiche Circular 131, 1978. 24 p, 6 fig, 5 tab, 43 ref, 2 append.

Descriptors: *Fish toxins, *Toxicity, *Illinois, *Laboratory tests, *Water pollution effects, Copper, Fish, Water pollution, Water quality, Channel catfish, Sunfishes, Data collections, Analytical techniques, Methodology, Bioassay, Alkalinity, Water properties, Mortality.

This study was concerned with documenting the acute toxicity effects that varying concentrations of copper have on certain fishes native to Illinois lakes and streams. The fishes observed were bluegill and channel catfish. Concentrations of copper were quantified in terms of its most toxic fraction to fish, i.e., soluble copper. The bioassays were of 14 days duration, and they were performed with various fish sizes and water temperatures. The results were derived from water high in the salts of calcium and magnesium with correspondingly high alkalinity. Acute toxicity curves were developed for each species permitting assessment for 14-day TL50 (toxicant concentration at which 50% of test specimens survive). The 14-day TL50 at 24C was 2.5 mg/l soluble copper for 0.5 gram bluegill, and 3.7 mg/l soluble copper for 1.5 gram bluegill. In the case of the channel catfish, apparently the more sensitive species to copper, the 14-day TL50 at 22C was 1.2 mg/l soluble copper. For the protection of the fishes investigated and in conjunction with the water pollution regulation of Illinois, the soluble copper levels in Illinois streams having water characteristics similar to those of the dilution water used should not exceed 0.12 mg/l. (Humphreys-ISWS)

ACCLIMATION TO TEMPERATURE AND DEATH AT HIGH CHANGING LETHAL TEMPERATURES IN CYPRINION MACROSTOMUS (HECKEL),
Mosul Univ. (Iraq). Dept. of Biology.
O. A. M. Al-Habbib, and W. M. S. Al-Habbib.
Journal of Thermal Biology, Vol. 4, p 75-77, 1979. 3 fig, 1 tab, 7 ref.

Descriptors: *Environmental effects, *Temperature, Resistance, Fish, Freshwater, Mortality, Lethal temperature, Acclimation.

Results of these laboratory investigations showed that lethal temperature increases with increasing acclimination temperature. LT50 increased from 34.0 to 39.3C, when acclimination temperature increased from 15 to 30C. Survival time at a changing lethal temperature is dependent upon the first lethal temperature to which the fish is exposed as well as the sequence of temperature changes. It is suggested that thermal resistance which occurred in the ascending order of lethal temperatures, may result from additional acclimination attained by the fish while in the resistance zone and that this may be of ecological importance. (Chilton-ORNL)
W79-06266

THE EFFECT OF TEMPERATURE ON THE CONVERSION OF PROINSULIN IN COD, GADUS MORHUA,
Memorial Univ. of Newfoundland, St. John's. Dept. of Biochemistry.
N. Liunardo, and C. L. Hew.
Journal of Thermal Biology, Vol. 4, p 79-83, 1979, 4 fig, 2 tab, 17 ref.

Descriptors: *Environmental effects, *Temperature, Biochemistry, Cod, Enzymes, Hormone activity.

The synthesis of proinsulin and its conversion to insulin were demonstrated at 15C in vitro. At 5C only proinsulin synthesis occurred. The conversion of proinsulin to insulin was found to be temperature-sensitive, reversible, and it was not inhibited by puromycin. It was concluded that the effect of temperature on the conversion of inactive prohormone to biologically active hormone might play an important role in controlling the level of active hormones under various environmental conditions. (Chilton-ORNL)
W79-06298

THE EFFECT OF LIQUID WASTE DISCHARGES FROM STEAM GENERATING FACILITIES,
Battelle Pacific Northwest Lab., Richland, WA.
H. E. McGuire, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as BNWL-2393, Price codes: A04 in paper copy, A01 in microfiche. Report BNWL-2393, 1977. 45 p, 7 fig, 6 tab, 42 ref, 1 append.

Descriptors: *Electric powerplants, *Water pollution effects, Water quality standards, Waste water, *Model studies, Suspended solids, Chlorine, Hydrogen ion concentration, Nutrients, Heavy metals, Oil, Radioisotopes, Model studies.

The effects of liquid waste discharges from steam electric generating facilities on the environment are summarized. Potential pollutants include chlorine, solids, impaired pH, nutrients, heavy metals (zinc, chrome, phosphorous), oil and grease, heat, and trace radionuclides. Existing water quality indices and development of a new model and scaling functions are discussed. The simple model is a comparative tool intended to be used as an evaluation method on multiple site alternatives. Effluent limitations developed by the Environmental Protection Agency make it almost certain that liquid waste water discharges from new facilities will cause little or no problem to the environment. PHYSICAL OCEANOGRAPHY,
California State Univ., Fullerton.
N. J. Maloney, and K-M. Chan.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol. 1, p 3-1 - 3-65, September 1974. 30 fig, 12 tab, 78 ref.

Descriptors: *Baseline studies, *Waves(Water), *Tides, *Circulation, Resources development, Environmental effects, Water pollution effects, Path of pollutants, Upwelling, *Outer Continental Shelf, Southern California Bight, California Current, Physical oceanography.

Information concerning the oceanic circulation, waves, tides, and physical properties of the water in the Southern California Bight is summarized. Southern California is located on the eastern boundary of the North Pacific Ocean. As a result, the surface water seaward of the offshore islands moves south with the eastern boundary current, the California Current. A southerly current flows north below the California Current, and a southerly surface countercurrent occurs landward of the California Current. Seasonal coastal upwelling, mixed semidiurnal tides, and wave motion cause distinct circulation patterns in the littoral zone. No large tsunamis have been recorded in the Southern California area. This portion of the coast is less susceptible to large tsunamis than other coastal zones because of the wave refraction over the basin and ridge bathymetry of the borderland. The water in the Southern California Bight region of the California offshore is a mixture of relatively low temperature-low salinity water transported south in the California Current with higher temperature-higher salinity water brought north in the California Undercurrent. ZOOPLANKTON,
California Univ., Irvine.
R. R. Seapy.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol. 2, p 8-1 - 8-99, September 1974. 3 fig, 16 tab, 54 ref.

Descriptors: *Baseline studies, *Oil pollution, *Water pollution effects, *Zooplankton, Resources development, Environmental effects, Biomass, *Outer Continental Shelf, Southern California Bight.

The species composition and distribution of the zooplankton in waters overlying the borderland are known from a series of studies that span a broad period of time and overlap only occasionally for any given year. Attempts to relate changes in abundance of zooplankton populations to the occurrence of oil spills have been unsuccessful because of the difficulty of relating any changes to oil pollution as the causative factor. The general decline of numbers and biomass was correlated with the general increase in pollution. However, it was not possible to relate these changes to specific pollutants. In addition to the demonstrated toxic effects on zooplankton, indirect effects should also be noted. Beneath a thick oil slick, the penetration of light may be reduced by 90%. Aside from the obvious effects of decreased light intensity on photosynthetic rate by phytoplankton populations, such a decreased light intensity could also disrupt normal patterns of depth distribution for zooplankters, interfere with diel migration patterns, and make visual predators less effective. BENTHIC INVERTEBRATES,
California State Univ., Fullerton.
D. B. Bright.
In: Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol 2, p 10-1 - 10-291, September 1974. 9 fig, 24 tab, 248 ref.

Descriptors: *Baseline studies, *Benthos, *Invertebrates, *Aquatic communities, Water pollution effects, Resources development, Heavy metals, Chlorinated hydrocarbon pesticides, *Outer Continental Shelf, Southern California Bight, Environmental impact.

The web of organisms found along the Southern California coast is extensive. Numerous benthic invertebrate species show a wide distribution while some are abundant but occur only in selected geographical areas. This report is divided into 3 major sections: major benthic invertebrate communities, environmental impact on benthic invertebrates, and species lists of major groups of benthic invertebrates. The Southern California coastal region contains some of the most rapidly expanding urban complexes in the United States. The waters within a few kilometers of shore are directly influenced by this intense development. If the ocean is to continue to satisfy the often conflicting demands of the human population, both aspects of the environmental quality issue must be considered. The degree to which marine ecosystems can be stretched thus becomes pivotal. Yet, whether it is possible to separate those events which are indigenous to the 'Natural' ecosystem from those due solely to man's influences is problematic. (See also W79-06449) (Sinha-OEIS)
W79-06459

FISHES,
California State Univ., Fullerton.
M. H. Horn.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol 2, p 11-1 - 11-124, September 1974. 4 fig, 11 tab, 106 ref.

Descriptors: *Fish, *Baseline studies, *Oil pollution, *Environmental effects, Diseases, Heavy metals, Chlorinated hydrocarbon pesticides, Water pollution effects, Resources development, *Outer Continental Shelf, Southern California Bight, Petroleum hydrocarbons, Natural seeps.

The marine environment off southern California with its diverse chemical, physical, and geological characteristics provides a wide variety of habitats for fishes. Although numerous natural oil and gas seeps occur in the region and although oil drilling wastes are among the major wastes dumped in the study area, very little information is available on the effects of these materials on fishes of fisheries in southern California marine waters. In a survey of the effects of the Santa Barbara Channel oil spill, it was reported that fish were still present after the spill and that sampling in the area by the California Department of Fish and Game indicated no adverse effects. An analysis also did not reveal any abnormal conditions of fish and macroplankton populations. The reduction in the fish catch following the spill was said to be due to reduced fishing effort in the oily waters and to harbor closure at Ventura (because of flood damage) and at Santa Barbara (because of the oil spill). More research is needed on the effects of petroleum hydrocarbons on fishes especially in an area such as southern California where the biota is subject to both natural and man-caused contamination. (See also W79-06449) (Sinha-OEIS)
W79-06460

MARINE MAMMALS,
Southern California Ocean Studies Consortium, Long Beach.
M. D. Dailey.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol 2, p 12-1 - 12-37, September 1974. 8 fig, 2 tab, 48 ref.

Descriptors: *Baseline studies, *Mammals, *Water pollution effects, Environmental effects, Resources development, *Outer Continental Shelf, Cetaceans, Pinnipeds, Carnivores, Southern California Bight, Environmental impact.

The reported marine mammal fauna of Southern California and the Channel Islands consist of cetaceans, pinnipeds and one carnivore. All three of these groups occur or have occurred in the study area, some as residents and others as transient recorded only by incidental sitings. Annotated species lists are presented giving range, study area sitings, population, life history and diseases. (See also W79-06449) (Sinha-OEIS)
W79-06461

MARINE AND SHORE BIRDS,
California State Univ., Long Beach.
K. E. Bender, C. T. Collins, and S. L. Warter.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol 2, p 13-1 - 13-103, September 1974. 6 tab, 27 fig.

Descriptors: *Baseline studies, *Birds, *Habitats, *Oil spills, Water pollution effects, Environmental effects, Mortality, Resources development, *Outer Continental Shelf, Southern California Bight.

Habitats and the birds which occupy them in the study area of Southern California can be divided into aquatic communities and terrestrial communities. Environmental alterations in either salt or fresh-water habitats usually make considerable, and sometimes major, changes in the other as well. There are several ways in which elements of the bird fauna are highly susceptible to loss or severs (and irreversible) damage through human activity or development. Probably the most readily apparent of these danger points associated with increased human use of the area is the vulnerability of open-water and littoral zone birds to destruction by floating oil. Populations of some of these species have been much reduced in numbers already by various kinds of human interference, and a major oil spill in the area might so deplete the remaining populations that the species would not be able to recover and would be extirpated from the study area. Even in more numerous species where the danger of outright extinction or extirpation is less, the reduction in numbers will affect the population and the interrelated biological community for decades to come. It is essential that great care and attention be given to the prevention of these spills and leaks, rather than to the more dramatic and highly publicized, but largely unsuccessful, after-the-fact rescue and clean-up operations. (See also W79-06449) (Sinha-OEIS)
W79-06462

MARSHES AND BAYS,
California State Univ., Long Beach.
J-S. Ho.
In: A Summary of Knowledge of the Southern California Coastal Zone and Offshore Areas, Vol 2, p 14-1 - 14-59, September 1974. 8 fig, 9 tab, 126 ref.

Descriptors: *Baseline studies, *Marshes, *Bays, *Ecosystems, *Biota, Crustaceans, Monitoring, Water pollution effects, Environmental effects, Resources development, *Outer Continental Shelf, Southern California Bight, Polychaeta, Environmental impact.

There are nineteen major coastal embayments in Southern California. Only three of them have remained relatively unaltered, i.e., Anaheim Bay, Upper Newport Bay, and Tijuana Estuary. Since very little biological survey of the marshes and bays was done in the past, a checklisted information of the flora and fauna of the area cannot be prepared. The biota of Anaheim Bay are comparatively better known and probably represent a possible flora and fauna of the Southern California coastal embayments before alteration. Several species of fish utilize the bay for spawning and nursery grounds and a great many species of birds use it as nesting, feeding, and shelter area. Polychaeta is the single most studied group of organisms, for certain species of them can be used as indicators of the bottom condition for monitoring pollution. A new form of extremely rare Crustacea was recovered from Anaheim Bay. It belongs to Cephalocarida, which is the most primitive living Crustacea of the world. The existing condition of biological knowledge underscores the difficulty in understanding the ecosystem of the coastal embayments and their relationship with the total coastal ecology, since a biological inventory is lacking and only a few species are known to a level of quantitative characterization, e.g., biomass, density per unit area, environmental cost. RECOMMENDATIONS FOR BASELINE RESEARCH IN CENTRAL AND NORTHERN CALIFORNIA RELATIVE TO OFFSHORE RESOURCE DEVELOPMENT.
Proceedings of Conference/Workshop held in San Francisco, California, on October 22-24, 1976, Sponsored by the Bureau of Land Management, Niesen, T.M. (Ed.). San Francisco State University, San Francisco, CA School of Science. January 1977, 285 p, 4 append.

Descriptors: *Baseline studies, *Continental Shelf, *Resources development, Monitoring, Fisheries, Wildlife, Water pollution effects, Water pollution sources, *Outer Continental Shelf, Northern California, Central California.

During three days of meetings at the conference on baseline research in northern and central California relative to offshore resource development, the participants in the conference developed a number of recommendations for baseline research in this geographical area. The first section of this initial report represents an attempt to coordinate the recommendations, and to group them into four categories: general recommendations which speak to the overall framework in which the research is to be carried out, recommendations for baseline studies, recommendations for monitoring studies, and recommendations for special projects. The second section of the report attempts to establish an operational framework within the work which is de signed to optimize the utilization of resources an to encourage an interdisciplinary understanding o the north and central California continental shel region. FISHERIES AND WILDLIFE,
California State Dept. of Fish and Game, Menlo Park.
J. L. Baxter.
In: 'Recommendations for Baseline Research in Central and Northern California Relative to Offshore Resources Development', Proceedings of Conference/Workshop, held in San Francisco, CA, October 22-24, 1976, p 129-135, January 1977.

Descriptors: *Resources, Development, *Data collections, Baseline studies, Fisheries, Wildlife, Birds, Mammals, Water pollution effects, Oil pollution, Drilling, *Outer Continental Shelf, Petroleum development, Northern California, Central California.

The potential impacts of offshore oil and resource development on fisheries are of two principal types. One is the actual effects of petroleum products upon any or all developmental stages of the organisms themselves resulting from a spill or other accident. The other is the 'preemption' of fishing grounds by drilling operations, various underwater structures such as pipelines, wellheads, etc., and other activities related to activities in the offshore area. Marine birds are particularly sensitive to man's exploitation of resources in the marine environment. Some sea birds are more vulnerable to oil at sea than almost any other organism. There is not a great deal of information particularly of a systematic and continuing type on the distribution and abundance of marine birds. Studies of the effects of oil pollution on marine mammals are not extensive and no accurate prediction on its impact can be made at this time. Some studies have indicated that surface exposure to oil has relatively little effect on non fur-bearers, such as stellar and California sea lions, elephant seals, and harbor seals. The sea otter is one of the most susceptible to oil spills and most studied. It is quite obvious that although many of the data systems are in excellent shape, there is a great deal of information needed if we are to design programs which will provide the data necessary to evaluate offshore resource development. W79-06467

RECOMMENDATIONS FOR BASELINE RESEARCH IN WASHINGTON AND OREGON RELATIVE TO OFFSHORE RESOURCE DEVELOPMENT.
Proceedings, Conference/Workshop, December 15-17, 1976, Portland, Oregon. Research Triangle Institute, Research Triangle Park, NC, February 1977. Massoglia, M.F. (Comp.). 313 p, 4 append. AA550-CT6-54.

Descriptors: *Baseline studies, *Washington, *Oregon, *Resources development, *Planning, *Management, Exploration, Drilling, Hazards, Water pollution sources, Water pollution effects, Fisheries, Birds, Biota, *Outer Continental Shelf, Petroleum development.

The conference/workshop was cosponsored by the Bureau of Land Management and conducted and cosponsored by the Research Triangle Institute. The objectives were: to summarize available information needed to understand the environmental processes of the Continental Shelf off Washington and Oregon; to provide any predictions presently possible of the effects of OCS oil and gas development on the environment of the Washington and Oregon OCS area; to identify subject areas in which additional information is required for reasonable prediction and understanding of the environmental effects of oil and gas development in this area; and to formulate recommendations for a studies program that will help determine the environmental impacts of drilling in the Washington and Oregon OCS area. The recommendations of the various workshops are summarized and structured into priority groupings. Study recommendations to develop environmental data required for decisionmaking during leasing activities are considered to be of the highest priority and are placed in Group I. Studies designed to develop data required for the exploratory-drilling and production-drilling phases are placed in Group II, and other construction activities and production operations are in Group III. Studies associated with abnormal conditions could fall into any of the three groups, depending on what phase of operation is concerned. (Sinha-OEIS)
W79-06468

RECOMMENDATION FOR BASELINE RESEARCH IN SOUTHERN CALIFORNIA RELATIVE TO OFFSHORE RESOURCE DEVELOPMENT.
Proceedings of Conference/Workshop held in Long Beach, California, on December 5-7, 1974, Sponsored by the U.S. Bureau of Land Management. February 1975. Lavenberg, R.J. and Earle, S.A. (Eds.). Southern California Academy of Sciences, Los Angeles. 266 p, 8 append.

Descriptors: *California, *Resources development, *Baseline studies, *Planning, *Continental Shelf, Environmental effects, Water resources, Water pollution effects, Aquatic biology, Oil pollution, Leases, *Outer Continental Shelf, *Southern California, Petroleum development, Environmental impact.

The conference and workshops were organized in such a manner that the proceedings resulting from them would summarize the environmental knowledge about the southern California Outer Continental Shelf and coastal areas. Specifically, the objectives for these meetings were: (1) to expose as much information as possible about each geographic area and discipline; (2) to provide a summary of available related information and understanding for a portion of the Continental Shelf as designated by the Bureau of Land Management in the southern California area; (3) to identify the areas of knowledge in which additional information is essential for reasonable prediction and understanding of the environmental effects of drilling in this area; (4) to formulate recommendations for baseline and monitoring programs adequate for determination of the environmental effects and impact of oil and gas development on the Outer Continental Shelf in this area; and (5) to provide wide public participation and exposure. U.S. GEOLOGICAL SURVEY OFFSHORE PROGRAM OF RESOURCE AND GEO-ENVIRONMENTAL STUDIES AND TOPICAL INVESTIGATIONS, PACIFIC - ARCTIC REGION,
Geological Survey, Menlo Park, CA.
D. W. Scholl.
Open-File Report No 78-422, 1978. 113 p, 22 fig, 2 tab, 4 append.

Descriptors: *Pacific Ocean, *Arctic Ocean, *Bibliographies, *Resources development, Geology, Oil, Gases, Environment, *Outer Continental Shelf, Petroleum development, Geo-environmental studies.

The Geological Survey's marine geology investigations in the Pacific-Arctic area are presented in this report in the context of the underlying socio-economic problem of expanding the domestic production of oil and gas and other mineral and hard- and soft-rock resources while maintaining acceptable standards in the marine environment. The primary mission of the Survey's Pacific-Arctic Branch of Marine Geology is to provide scientifically interpreted information about the (1) resource potential, (2) geo-environmental setting, and (3) overall geologic characteristics of the continental margins (that is, the continental shelf, slope and rise) and adjacent deeper water and shallower coastal areas off California, Oregon, Washington, Alaska and Hawaii and also, where it is of interest to the U.S. Government, more remote deep-sea areas of the Pacific-Arctic realm. SURFACE CURRENTS IN THE NEW YORK BIGHT AS RELATED TO A SIMPLE OIL TRAJECTORY MODEL,
National Oceanic and Atmospheric Administration, Washington, DC. Environmental Data and Information Service.
J. M. Bishop.
In: Preprint Volume: Conference on Coastal Meteorology, held Virginia Beach, VA on September 2123-1976. p 98-101, 1976. 4 fig, 8 ref. American Meteorological Society, Boston, Mass.

Descriptors: *New York, *Oil spills, *Models, *Water pollution effects, *Path of pollutants, Environmental effects, Baseline studies, *Outer Continental Shelf, *New York Bight, *Oil trajectory, Surface currents, Petroleum development.

A hypothetical path of oil movement is generated by computing trajectories from each third hourly wind observation. The results of two simulated spills are presented as probability diagrams. About 1000 simulated spills were used for each spill site. These diagrams indicate the percentage of time that a 10 mile x 10 mile offshore area and 10-mile coastal segments would be impacted by the calculated oil trajectories on an annual basis. Oil movements from both spill sites exhibit a strong offshore tendency. This might be explained in terms of the seasonal march of the annual wind and density field in the New York Bight. In the summer, winds are weak and combine with a strong southwesterly baroclinic flow to produce generally longshore oil movement. During the winter a strong eastward mean wind and a relatively weak baroclinic flow give a strong offshore tendency for oil movement. Thus, the annual pattern of oil movement exhibits a marked offshore and longshore (southerly) character. (Sinha-OEIS)

ATLANTIC OFFSHORE PROGRAM. A PRELIMINARY PLAN TO OBTAIN VITAL INFORMATION FOR THE NATION TO PROTECT AND USE ITS OFFSHORE RESOURCES,
Draft Report, prepared at the Atlantic Offshore Program Planning Workshop held at Newark, Delaware on September 19-21, 1977. Also as Delaware University Sea Grant Report No. DEL-SG-19-77m 1977. 464 p.

Descriptors: *Resources development, *Oceanography, *Baseline studies, *Conferences, *Engineering, Sediment transport, Dredging, Ocean waves, Soils, Pipelines, Management, Geology, Biology, Environmental effects, *Outer Continental Shelf, U.S. East Coast, Coastal processes, Geotechnical properties, Dredged material.

This workshop was a sequel to the May problem identification workshop and was held at the University of Delaware on September 18-21, 1977 and hosted by the 15 east coast Sea Grant institutions. The objective of this second workshop was the development of a preliminary plan for a comprehensive, economical, practical and sound oceanographic/oceanographic engineering program to solve, or shed useful light, on the priority problems identified in the users workshop of May 19-21, 1977. Task Groups reported on the following problems: dredged material disposal and sediment transport processes; assimilative capacity of the Atlantic offshore area; wave data acquisition and use; management of living resources; modeling physical processes; Atlantic offshore area and resources management; soil strength and stability; interaction of structures, equipment and marine environment. Specialty Teams prepared program plans for certain activities to strengthen and broaden the program. These activities are: physical oceanography; biological oceanography, chemical oceanography, geology and geophysical oceanography, instrumentation, communications, public interest and state participation, and management. ANALYSIS OF BRINE DISPOSAL IN THE GULF OF MEXICO. BIOASSAY RESULTS.
National Oceanic and Atmospheric Administration, Washington, DC. Center for Experiment Design and Data Analysis.
Report to the Department of Energy Strategic Petroleum Reserve Program, Salt Dome Storage, March 1978. 118 p, 34 ref, 5 append.

Descriptors: *Gulf of Mexico, *Brine disposal, *Bioassay, *Baseline studies, *Salinity, Water pollution effects, Plankton, Benthos, Resources development, *Outer Continental Shelf, Petroleum development, Biological tolerance, Salinity tolerance, Environmental effects.

As crude oil is pumped into an existing cavern for storage, saturated brine is displaced and brought to the surface for disposal. Disposal of this brine into the Gulf of Mexico is one alternative and the Department of Energy has requested that NOAA assess the environmental consequences of such an operation. The offshore brine discharge is believed to primarily affect planktonic larvae and benthic species. The hypersaline tolerances of benthic and nektonic species expected to be present in the proposed disposal area, which may include penaeid shrimp, as well as important nektonic species, such as croaker, redfish, spot, black drum, sheepshead, and seatrout. There are no well-defined limits of biological tolerance to hypersaline conditions, and each species has a range of optimum salinity for growth and reproduction. Rate, duration, and magnitude of salinity changes are therefore important to assess the potential biological impact. Laboratory studies of salinity sensitivity of various organisms were conducted by NOAA contractors. The final reports on these studies are reproduced as appendices to this report. (Sinha-OEIS)

EFFECTS OF OCEAN DUMPING ACTIVITY MID-ATLANTIC BIGHT - 1976 INTERIM REPORT,
Environmental Protection Agency . Annapolis, MD.
D. W. Lear, M. L. O'Malley, and S. K. Smith.
Report No. EPA 903/9-77-029, July 1977. 184 p, 93 fig, 34 tab, 19 ref.

Descriptors: *Waste disposal, *Sewage sludge, *Water pollution effects, *Monitoring, Metals, Polychlorinated biphenyls, Mortality, Clams, Benthos, Mollusks, Sediments, Resources development, *Outer Continental Shelf, *Mid-Atlantic Bight, *Ocean dumping, Arctica islandica.

Significantly high concentrations of metals known to be present in City of Philadelphia sewage sludge can be found on occasion at points in the sediments in and near the sludge release site. Several bands with consistently high concentrations of metals, in association with high organic carbon, have been partially identified and have persisted for at least

fourteen months in and adjacent to the southern part of the sludge release site. Polychlorinated biphenyls (PCB's) were widely distributed in concentrations that may be inimical to marine organisms. The time distribution indicated cyclical inputs, possibly from the coastal zone. Localized areas of high impact, associated with other parameters from sewage sludge, have been identified. Mortalities of the mahogany clam, Arctica islandica, were indicated at loci in and near the ocean dumping activity. Detailed bathymetry of the persistently impacted area south of the sludge release site indicates gentle geomorphic features may affect the aggregation of dumped materials. Statistically significant changes of the benthic infaunal communities are occurring in the impacted area south of the sewage sludge release site. A preliminary indication of diseased macrofauna associated with the impacted area was found in February 1977. Molluscan shellfish in the vicinity of the sewage sludge site appear to harbor bacteria of sanitary significance. (Sinha-OEIS)

POLLUTING INCIDENTS IN AND AROUND U.S. WATERS, CALENDAR YEAR 1977.
Coast Guard, Washington, DC.
Commandant Instruction No. M16450.2 (old CG-487), July 1978. 33 p.

Descriptors: *United States, *Water pollution, *Data collections, *Oil spills, Water pollution sources, Baseline studies, Resources development, *Outer Continental Shelf, Petroleum development, Oil transport.

The Federal Water Pollution Control Act requires that any discharge of oil or hazardous substance in harmful quantities, be reported to the 'appropriate agency of the United States Government'. The Coast Guard has been designated as that agency by Executive Order 11735. The Pollution Incident Reporting System (PIRS) serves two purposes: first, it functions as a management information system for the Marine Environmental Protection Program; and second, it provides a means to respond to frequent inquiries from Congress, the press, special interest groups and the public concerning marine pollution and Coast Guard activities to protect the environment. Presently, the system contains data which describes the nature of the discharge, the response (cleanup) to the discharge and penalty actions. (Sinha-OEIS)

SUMMARIZATION AND INTERPRETATION OF HISTORICAL PHYSICAL OCEANOGRAPHIC AND METEOROLOGICAL INFORMATION FOR THE MID-ATLANTIC REGION,
National Oceanic and Atmospheric Administration, Washington, DC. Center for Experiment Design and Data Analysis.
R. G. Williams, and F. A. Godshall.
Final Report to the U.S. Bureau of Land Management, October 1977. 305 p. AA550-1A6-12.

Descriptors: *Oceanography, *Meteorology, *Path of pollutants, *Baseline studies, Water pollution, Oil spills, Environmental effects, Data, *Outer Continental Shelf, Mid-Atlantic region.

The results of an environmental study of the Mid-Atlantic region of the Outer Continental Shelf is presented. The area defined for this study is the area extending northward from 38 degrees N to 41 degrees N latitude between the coast and the 2,000 m isobath. The surface wind field, which plays an important role in determining the movement of spilled oil and other pollutants, is dealt with in detail. A major part of the report is devoted to the physical characteristics of the water masses in the Mid-Atlantic region, whose structure and variability are particularly relevant to the dispersion and advection of pollutants. Since diffusion, mixing, and advection are seldom measured directly, the potential for these processes must be inferred from analysis of such variables as water temperature, salinity, and density. In addition to an analysis of the surface and subsurface water temperature and salinity, data on dissolved oxygen and nutrient concentrations are presented, since these data are important for an evaluation of potential degradation rates of ocean pollutants. Circulation features analyzed include the mean surface current field and its variability, which act directly to advect and disperse pollutants; subsurface currents and their tidal constituents; and subtidal flows which produce large water mass characteristics. Some inferences concerning vertical mixing are drawn. Ocean waves are discussed which includes estimates of return periods of extreme wave heights in the region. Finally, the data used are evaluated in terms of reliability and deficiencies and recommendations are made for the design of future field programs to fill existing gaps in the data needed for an adequate environmental assessment. BEHAVIORAL THERMOREGULATION AND DIEL ACTIVITY IN WHITE SUCKER (CATOSTOMUS COMMERSONI),
Pennsylvania State Univ., Wilkes-Barre. Dept. of Biology.
W. W. Reynolds, and M. E. Casterlin.
Comparative Biochemistry and Physiology, Vol. 59A, p 261-262, 1978. 10 ref.

Descriptors: *Environmental effects, *Temperature, *Fish behavior, Laboratory tests, Suckers, *Thermoregulation, Preferred temperature.

White suckers were tested in an electronic thermoregulatory shuttle box, which permits a fish to control water temperatures by its movements between chambers monitored by photocells, to determine temperature preference. The range of preferred temperatures was the same during both day and night (22.8 to 26.1C) but the mode changed by 1C from 24C at night to 25C during the day. 89% of all activity occurred during the dark period. (Chilton-ORNL)

METABOLIC RATE, TEMPERATURE ACCLIMATION AND RESISTANCE TO HIGH TEMPERATURE OF SOFT-SHELL CLAMS, MYA ARENARIA, AS AFFECTED BY SHORE LEVEL,
Maine Univ. at Orono. Dept. of Zoology.
G. Anderson.
Comparative Biochemistry and Physiology, Vol 61A, p 433-438, 1978. 4 fig, 2 tab, 30 ref.

Descriptors: *Environmental effects, *Temperature, *Metabolism, Respiration, Clams, Intertidal areas, Resistance, Temperature acclimation.

Clams were collected from four levels (subtidal, low intertidal, mid intertidal and high intertidal) of a rocky beach. Oxygen consumption rates were measured at varying temperatures. It was found that, for intermediate size clams, metabolic rates were highest at the high intertidal level and lowest at the low intertidal level with subtidal and mid intertidal clams having intermediate rates. Clams from low intertidal levels showed near-complete metabolic compensation to temperature change. Clams from mid and high intertidal levels showed partial compensation. Clams from the subtidal level showed supraoptimal compensation. Warm acclimated clams from the subtidal level were found to be metabolically independent at temperatures ranging from 10 to 25C. Clams from subtidal and high intertidal levels were more resistant to high temperature (25C) than those from low and mid intertidal levels. (Chilton-ORNL)

BEHAVIORAL THERMOREGULATION IN THE ROCK BASS, AMBLOPLITES RUPESTRIS,
Pennsylvania State Univ., Wilkes-Barre. Dept. of Biology.
W. W. Reynolds, and M. E. Casterlin.
Comparative Biochemistry and Physiology, Vol 60A, No 4, p 263-264, 1978. 1 fig, 11 ref.

Descriptors: *Environmental effects, *Temperature, *Fish behavior, Bass, Photoperiodism, Thermoregulation, Preferred temperature.

Adult rock bass were tested in an electronic thermoregulatory shuttlebox, which permits a fish to control water temperatures by its movements between chambers monitored by photocells, to determine the occurrence of preferred temperature or locomoter activity. The fish attained final thermal preferendum at 30C within 24 hours and showed no difference in preferred temperature or in locomotor activity between day and night. (Chilton-ORNL)
W79-06480

ONTOGENETIC CHANGE IN PREFERRED TEMPERATURE AND DIEL ACTIVITY OF THE YELLOW BULLHEAD, ICTALURUS NATALIS,
Pennsylvania State Univ., Wilkes-Barre. Dept. of Biology.
W. W. Reynolds, and M. E. Casterlin.
Comparative Biochemistry and Physiology, Vol 59A, p 409-411, 1978. 1 tab, 25 ref.

Descriptors: *Environmental effects, *Temperature, Fish, Fish behavior, Biorhythms, Photoperiodism, Preferred temperature.

Adult and juvenile yellow bullheads were tested in an electronic shuttle box which permits a fish to control water temperatures by its movements between chambers monitored by photocells. The 24-hr mean preferred temperature of juveniles was 28.8C and of adults was 27.6C. Relatively little difference was seen in preferred temperatures among dusk, night and day periods. Juveniles were most active (40% of total 24 hr activity) during dusk period and adults were most active (63%) at night. In both cases, the respective 24-hr mean temperatures were equal to the mean preferred temperature during the period of greatest activity but there was no consistent relationship between highest and lowest preferred temperatures and the activity cycle. (Chilton-ORNL)

THE FINAL THERMAL PREFERENDUM OF FISHES: SHUTTLING BEHAVIOR AND ACCLIMATION OVERSHOOT,
Pennsylvania State Univ., Wilkes-Barre. Dept. of Biology.
W. W. Reynolds.
Hydrobiologia, Vol 57, No 2, p 123-124, 1978. 14 ref.

Descriptors: *Environmental effects, *Thermal pollution, Fish, Temperature, Fish behavior, Temperature preferendum.

Because fish tend to shuttle back and forth within a range of temperatures above and below the preferendum and because they acclimate more rapidly to increasing than to decreasing temperatures, it is suggested that they become acclimated nearer to the maximum than to the mean of a cycled thermal regime. Thus, thermoregulating fish can become acclimated to a temperature exceeding the final preferendum, even when given a free choice. These considerations imply that the ultimate temperature to which fish will gravitate in a gradient may not equal the crossover point at which preference and acclimation are equal. It is suggested that in future work it may be necessary to differentiate between crossover point and ultimate preferenda where these can be shown to differ significantly. (Chilton-ORNL)
W79-06482

GROWTH AND ADAPTATION TO SEA WATER IN UNDERYEARLING SOCKEYE (ONCORHYNCHUS NERKA) AND COHO (O. KISUTCH) SALMON SUBJECTED TO REGIMES OF CONSTANT OR CHANGING TEMPERATURE AND DAY LENGTH,
Fisheries and Marine Service, Nanaimo (British Columbia).
W. C. Clarke, J. E. Shelbourn, and J. R. Brett.

Canadian Journal of Zoology, Vol 56, No 11, p 2413-2421, 1978. 8 fig, 2 tab, 33 ref.

Descriptors: *Environmental effects, *Thermal pollution, Temperature, Growth rates, Salmonids, Sockeye salmon, Smolt, Photoperiodism, Animal physiology, Underyearlings, Coho salmon.

Regimes of constant as well as changing temperature and day length were found to influence growth and osmoregulatory performance of sockeye and coho salmon. Changing temperatures did not influence the final length or weight achieved by the fish in comparison with a constant temperature of the same mean but the growth patterns were different. Temperature controlled the rate of response to photoperiod and thus changes in growth rate due to photoperiod treatments were evident at higher temperatures before they were at lower temperatures. It was concluded that artificial photoperiod treatments are not required to produce underyearling sockeye smolts in the spring, provided that water temperatures are adequate for growth to 75 mm. Coho smoltify at a larger size than sockeye and would need higher temperatures to produce underyearling smolts in the spring. (Chilton-ORNL)
W79-06483

THE IMPORTANCE OF HABITAT TEMPERATURES FOR GROWTH IN THE TROPICAL CICHLID TILAPIA RENDALLI BOULENGER,
Rhodesia Univ., Salisbury. Hydrobiology Research Unit.
M. S. Caulton.
Journal of Fish Biology, Vol 13, No 1, p 99-112, July 1978. 4 fig, 6 tab, 32 ref.

Descriptors: *Environmental effects, *Thermal pollution, Temperature, Fish, Growth rates, Biorhythms, Fish behavior, Diel migration, Diurnal distribution, Tilapia rendalli.

Growth of Tilapia rendalli was investigated using a bioenergetic model to measure the effects of temperature on laboratory satiation, gross assimilation efficiency, calorigenic cost of food processing, ammonia excretion and energy budget. It was found that growth of the fish was enhanced by daily movement into areas of warm (as high as 34C) water during the day and return to cooler water (18C) at night. Optimal temperatures were predicted to be 18 and 30C. (Chilton-ORNL)
W79-06484

GROWTH, FOOD CONVERSION AND SURVIVAL OF O-GROUP ENGLISH SOLE (PAROPHRYS VETULUS GIRARD) AT FIVE TEMPERATURES AND FIVE RATIONS,
Oregon State Univ., Newport. Marine Service Center.
S. F. Williams, and R. S. Caldwell.
Aquaculture, Vol 15, No 2, p 129-139, October 1978. 6 fig, 1 tab, 23 ref.

Descriptors: *Environmental effects, *Temperature, *Food abundance, Growth rates, Fish, Mortality, Juveniles, English sole, Parophrys vetulus.

Young sole used in these investigations were fed a diet of Oregon Moist Pellets and were exposed to constant temperature-ration combinations between 9.5 and 21C and 0 and 16% rations for 12 weeks. Growth rate of the sole juveniles fed restricted rations was generally inversely related to temperature. Food conversion efficiency was highest (10.5% dry weight basis) at 8% ration and at 9.5C. Survival was low in all groups but highest at lower temperatures and higher rations. Several disease organisms caused or were associated with mortalities.
W79-06485

GROWTH AND SPAWNING IN THE PECTINID CHLAMYS OPERCULARIS IN RELATION TO TEMPERATURE AND PHYTOPLANKTON CONCENTRATION,
Portsmouth Polytechnic (England).
M. J. Broom, and J. Mason.
Marine Biology, Vol 47, No 3, p 277-285, 1978. 6 fig, 4 tab, 17 ref.

Descriptors: *Environmental effects, *Temperature, Food abunance, Mollusks, Growth rates, Spawning.

Growth rates and spawning conditions of queen scallops were monitored over a period of 18 months. Temperature and phytoplankton standing crop were also monitored. Shell growth was observed by the formation of lamellae and was found to occur most regularly under conditions of moderately high temperature and good food availability. Rapid growth in the spring resulted in the formation of a distinct ring. Development of the gonads and subsequent spawning did not appear to influence linear growth or lamella formation significantly. (Chilton-ORNL)
W79-06486

ACCUMULATION OF HEAVY METALS BY THE MARINE DIATOM DITYLUM BRIGHTWELLII (WEST) GRUNOW,
Melbourne Univ., Parkville (Australia). School of Botany.
G. S. Canterford, A. S. Buchanan, and S. C. Ducker.
Australian Journal of Marine and Freshwater Research, Vol 29, No 5, p 613-622, October 1978. 6 fig, 3 tab, 31 ref.

Descriptors: *Environmental effects, *Water pollution, Heavy metals, Absorption, Algae, Diatoms, Zinc, Lead, Copper, Cadmium, Biological concentration factor.

Accumulation of copper, zinc, cadmium, and lead by Ditylum brightwellii is reported. In the case of copper, no definite correlation was found between the amount of metal taken up by the diatoms and the metal concentration to which it was exposed. The amount of metals taken up generally increased with increasing concentration of the other metals studied. Metal uptake by the diatom was in the order of Zn > Pb > Cu > Cd. (Chilton-ORNL)
W79-06487

THE SURVIVAL OF EMBRYOS OF THE ANNUAL FISH NOTHOBRANCHIUS GUENTHERI EXPOSED TO TEMPERATURE EXTREMES AND THE SUBSEQUENT EFFECTS ON EMBRYONIC DIAPAUSE,
Orentreich Foundation for the Advancement of Science, Inc., New York.
J. R. Matias, and J. Markofsky.
Journal of Experimental Zoology, Vol 204, No 2, p 219-228, May 1978. 4 fig, 3 tab, 34 ref.

Descriptors: *Environmental effects, *Temperature, Growth stages, Fish, Embryonic growth stage, Diapause, Mortality, Nothobranchius guentheri.

Embryos of Nothobranchius guentheri were exposed to temperatures of -8.0, +3.4, 9.0, 32.7, 2nd 40.0C to determine thermal tolerance and responsiveness of embryos at diapause and at stages exclusive of diapause. Fully developed embryos and those at early stages of development were the most sensitive to temperature extremes. Specific early stages were not distinguished. Short exposure of Diapause I embryos to -8 and 3.4C eliminated Diapause II, while short exposure to 40C enhanced its duration. It was concluded that temperature is an important factor in influencing onset and duration of the diapauses. (Chilton-ORNL)
W79-06488

UPPER LETHAL WATER TEMPERATURE LEVELS FOR ENGLISH SOLE (PAROPHRYS VETULUS) AND ROCK SOLE (LEPIDOPSETTA BILINEATA) SUBJECTED TO GRADUAL THERMAL INCREASES,
National Marine Fisheries Service, Seattle, WA.
W. E. Ames, J. R. Hughes, and G. F. Slusser.
Northwest Science, Vol 52, No 3, p 285-291, 1978. 3 fig, 3 tab, 15 ref.

Descriptors: *Environmental effects, *Thermal stress, Thermal pollution, Temperature, Fish, Mortality, Seasonal, English sole, Rock sole.

Thermal tolerance studies are reported on 483 English sole and 260 rock sole. Test procedure was to gradually raise the temperature from ambient during the first hour, hold a test temperature (18, 21, 24, or 27C) for the next 4 hours, and gradually reduce temperature to ambient level during the 6th hour. Fish were observed during a 7 day period following tests. LL50 was found to be 26.1C for English sole and 24.9C for rock sole in the 27C test. LL50 was not reached at the other test temperatures. Death caused by thermal stress for both species was highest at each extreme of the respective size ranges. Total mortalities were 20% for English sole and 35% for rock sole. Mortality rates for both species appeared to be somewhat independent of seasonal water temperature fluctuations. (Chilton-ORNL)
W79-06489

DIEL PATTERNS OF PREFERRED TEMPERATURE AND LOCOMOTOR ACTIVITY IN THE GOLDFISH CRASSIUS AURATUS,
Pennsylvania State Univ., Wilkes-Barre. Dept. of Biology.
W. W. Reynolds, M. E. Casterlin, J. K. Matthey, S. T. Millington, and A. C. Ostrowski.
Comparative Biochemistry and Physiology, Vol 59A, p 225-227, 1978. 2 fig, 28 ref.

Descriptors: *Environmental effects, *Temperature, Fish behavior, Biorhythms, Preferred temperature.

Goldfish were tested in an electronic thermoregulatory shuttle box which permits a fish to control water temperatures by its movements between chambers monitored by photocells. Data showed a circadian rhythm with a unimodal peak (29.7C) of preferred temperature occurring during the 4 hrs preceding onset of the light period. Mean preferred temperature was 27.7C. Locomotor activity showed a bimodal pattern, with peaks occurring at the beginning and end of the dark period. There was no significant correlation (r=0.05) between temperature and activity. It was concluded that the most significant finding of the study was that the peak of the preferred temperature cycle of goldfish occurs during the same time period in which goldfish respond most favorably in body weight gain and in gonosomatic index to increased temperature. (Chilton-ORNL)
W79-06490

THE EFFECT OF THE RATE OF CHANGE OF TEMPERATURE ON THE RESISTANCE OF ASELLUS AQUATICUS (L.) TO HIGH LETHAL TEMPERATURES,
Trinity Coll., Dublin (Ireland). Dept. of Zoology.
T. M. Salih, and J. N. R. Grainger.
Journal of Thermal Biology, Vol 3, No 3, p 121-123, July 1978. 5 fig, 6 ref.

Descriptors: *Environmental effects, *Thermal pollution, Thermal stress, Temperature, Rates, Aquatic life, Adaptation, Acclimation, Temperature acclimation, Poikilotherms.

In this study on the effect of temperature rate change on survival at high temperatures it was found that the heat resistance of adult Asellus aquaticus increased with increasing acclimation temperature. Animals which had been acclimated to 20C and then heated to 35C at a rate of 1C/4 min were found to be less resistant at 35C than those placed directly at 35C. Similarly acclimated animals which were slowly heated to 30C and then suddenly placed at 35C exhibited increased heat acclimation in the more resistant individuals. It was concluded that when 20C acclimated Asellus are subjected to rising temperature, further acclimation takes place up to about 30C and this is most marked in the more resistant individuals. Above 30C the animals are adversely affected and this becomes progressively more intense as the temperature rises to 35C. (Chilton-ORNL)
W79-06491

EFFECT OF TEMPERATURE AND SALINITY ON HEAT TOLERANCE OF EMERITA HOLTHUISI,

Institute of Science, Bombay (India). Dept. of Zoology.
K. M. Kulkarni.

Geobios, Vol 5, No 3, p 97-100, 1978. 1 tab, 10 ref.

Descriptors: *Environmental effects, *Thermal stress, Temperature, Resistance, Salinity, Intertidal areas, Aquatic animals, Invertebrates, Crabs, Sand crabs.

Sand crabs were tested in four combinations of temperature and salinity (20 or 30C and 20% or 32% salinity). It was found that acclimation to high temperature generally increased resistance to lethal temperature and that low salinity generally decreased resistance. The most favorable combination for resistance to high temperature was acclimation to high temperature and high salinity. (Chilton-ORNL)

IMPLICATION OF GEOGRAPHIC LOCATION ON TEMPERATURE PREFERENCE OF WHITE PERCH, MORONE AMERICANA,

Maryland Univ., Frostburg. Center for Environmental and Estuarine Studies.
L. W. Hall, Jr., C. H. Hocutt, and J. R. Stauffer, Jr.

Journal of the Fisheries Research Board of Canada, Vol 35, No 11, p 1464-1468, 1978. 2 tab, 23 ref.

Descriptors: *Environmental effects, *Temperature, Fish, Perches, White perch, Location, Seasonal, Geographical regions, North Carolina, New Jersey, Maryland, Temperature preference.

Fish used in this study were collected from Albemarle Sound, N.C.; Wicomico River, MD; and Mullica River, N.J. Collection temperatures were 25C for each population. Fish were acclimated to 6, 12, 18, 24, 30, and 33C. Final temperature preference (calculated from linear regression) were 32.4C for North Carolina populations; 28.9C for Maryland populations; and 29.6C for New Jersey populations. Calculated final temperature preference (using the quadratic equation) for N.C., Md., and N.J. populations were 31.6, 29.3, and 29.2C, respectively. Final temperature preference from visual estimation were 32.5C for N.C. populations, 30.6C for Md. populations, and 28.6C for N.J. populations. It was concluded that geographical variations in temperature responses of white perch are a result of environmental differences found in each ecosystem. Yearly water temperature extremes of the three locations showed great variation. Nonthermal seasonal influences associated with each location could represent another possible means for influencing temperature preference. (Chilton-ORNL)
W79-06493

EFFECTS OF TEMPERATURE AND SALINITY ON THE METABOLISM AND BYSSAL FORMATION OF BRACHIDONTES VARIABILIS KRAUSS (BIVALVIA),

Hebrew Univ., Jerusalem (Israel). Dept. of Zoology.
S. Stern, and Y. Achituv.

Comparative Biochemistry and Physiology, Vol 59A, No 1, p 101-105, 1978. 6 fig, 3 tab, 25 ref.

Descriptors: *Environmental effects, *Temperature, *Salinity, Thermal stress, Adaptation, Metabolism, Intertidal areas, Mollusks.

Animals were acclimated to 21C and 42% salinity and then exposed to varying experimental regimes of temperature and salinity. It was found that an increase in temperature (from 27 to 33C) resulted in a net decrease in oxygen uptake. An increase in salinity (from 47 to 58%) resulted in a decrease in oxygen uptake. Combined increase in temperature and salinity resulted in initial fluctuations in oxygen uptake with a return to pretest rates. Nitrogen excretion increased in most of the experiments. At most of the temperature-salinity combinations, byssal activity recovered partially as compared to the acclimation conditions where byssal formation was 100%. At 33C, the first incidence of mortality was recorded 13 days after the start of the experiment. At 27C, the first mortality was found on the 26th day and 50% of animals were dead by the 96th day. It was concluded that the metabolic adaptation of this species is responsible for its ability to cross the Suez Canal and enter the Mediterranean. (Chilton-ORNL)

EFFECT OF TEMPERATURE, PH, ANTIBIOTICS, FORMALIN AND MALACHITE GREEN ON THE GROWTH AND SURVIVAL OF SAPROLEGNIA AND ACHLYA PARASITIC ON FISH,

Fisheries Research Inst., Szarvas (Hungary).
J. Olah, and J. Farkas.

Aquaculture, Vol 13, No 3, p 273-288, March 1978. 4 fig, 7 tab, 19 ref.

Descriptors: *Environmental effects, *Temperature, Hydrogen ion concentration, Parasites, Fish, Growth rates, Fungi, Fungicides, Fish parasites.

Twenty four strains of Saprolgenia and Achlya were isolated and tested for growth at different temperature and pH levels. Sensitivity and survival were determined for antibiotics and 40 combinations of formalin, malachite green and formalin-malachite green mixture. It was found that at low temperatures Saprolegnia strains grew faster than Achlya strains and that they germinate and begin growth in the spring at temperatures as low as 5C. Saprolegnia strains grew at a wider range of pH than Achlya strains. Nalidixic acid was the only antibiotic tested which exhibited an inhibiting effect on growth. Mixtures of malachite green and formalin were found to be the best fungicides. (Chilton-ORNL)

SYNERGISTIC EFFECTS OF TEMPERATURE, SALINITY AND LIGHT ON THE HERMATYPIC CORAL MONTIPORA VERRUCOSA,

Hawaii Inst. of Marine Biology, Honolulu.
S. L. Coles, and P. L. Jokiel.

Marine Biology, Vol 49, No 3, p 187-195, 1978. 2 fig, 6 tab, 30 ref.

Descriptors: *Environmental effects, *Temperature, *Salinity, *Light, Coral, Light intensity, Growth rates, Mortality, Interactions, Synergistic effects.

Colonies of Montipora verrucosa were acclimated to salinities of 20, 25, 30, 35 or 40% for 24 hours at normal ambient sea water temperatures of 23 to 27C and then exposed to rising temperatures at the rate of 0.5C/hour. In a second experiment, corals were exposed to varying intensities of light and temperature. It was found that temperature tolerance is affected by both light and salinity. At high temperatures, the ability of the coral to survive or resist damage is reduced by low salinities and high light intensities. In long-term growth investigations at both upper and lower sublethal temperatures, high light intensity resulted in substantial loss of zooxanthellar pigment, higher mortality rates, reduced carbon fixation and lowered growth rates. It was concluded that response of corals to a given ecological factor must vary with changes in other environmental parameters, and that these interactions are most important near the limits of tolerance for a given parameter. (Chilton-ORNL)

SIZE VARIATION AND THE DISTRIBUTION OF HEMIMETABOLOUS AQUATIC INSECTS: TWO THERMAL EQUILIBRIUM HYPOTHESES,

Academy of Natural Sciences of Philadelphia, Avondale, PA. Stroud Water Research Center.
B. W. Sweeney, and R. L. Vannote.

Science, Vol 200, No 4340, p 444-446, April 1978. 1 fig, 2 tab, 20 ref.

Descriptors: *Environmental effects, *Thermal pollution, Temperature, Aquatic insects, Growth rates, Larval growth stage, Mature growth stage, Size, Fecundity.

Two hypotheses are formulated concerning the importance of temperature to both size and geographical distribution of hemimetabolous aquatic insects. These hypotheses are based on laboratory data which suggest that modifying the optimum temperature regime by rearing insects in warmer or cooler environments affects the bioenergetic and developmental aspects of larval growth and results in lower individual adult weight and fecundity. It is suggested that these results may be critical to evaluating the affects of thermal pollution since warming the seasonal cycles of a river by 2 or 3C might eliminate species by affecting body size and fecundity. It was concluded that a geographically uniform set of data on larval growth rate, adult size, and fecundity for several species of aquatic insects is needed to test and refine the hypotheses. (Chilton-ORNL)

MICROSETELLA NORVEGICA (BOECK): A DIRECT RELATIONSHIP BETWEEN SEASONAL SEA TEMPERATURE AND ADULT SIZE IN A PLANKTONIC COPEPOD,

Newcastle-upon-Tyne Univ. (England). Dove Marine Lab.
F. Evans, and W. Diaz.

Crustaceana, Vol 34, No 3, p 313-315, 1978. 1 fig, 12 ref.

Descriptors: *Environmental effects, *Temperature, Size, Seasonal, Copepods.

The data presented indicate that, in contrast to information available on other copepods, Microstella norvegica is larger in summer than in spring and that its size is directly related to the sea temperature. No explanation of this divergence from the usual pattern of seasonal size in planktonic copepods is given. (Chilton-ORNL)

INTERSPECIFIC AND SEASONAL DIFFERENCES IN THE TEMPERATURE TOLERANCE OF STREAM FISH,

State Univ. of New York Coll. at Buffalo. Dept. of Biology.
K. T. Kowalski, J. P. Schubauer, C. L. Scott, and J. R. Spotila.

Journal of Thermal Biology, Vol 3, No 3, p 105-108, July 1978. 4 fig, 1 tab, 30 ref.

Descriptors: *Environmental effects, *Temperature, Fish, Resistance, Seasonal, Adaptation, Thermal stress, Acclimation.

Interspecific differences in temperature tolerances (CTM) of 13 species of stream fish acclimated to constant temperature (15.0C) and photoperiod (LD 12:12) are reported. Three of these species exhibited seasonal differences in CTM despite acclimation to constant laboratory conditions. Highest CTM was shown by Notropis stramineus at 33.1C. Lowest CTM's were shown by Hypentelium nigricans at 30.8C, Cottus bairdi at 30.9C, and Nocomis micropogon at 30.9C. It was suggested that while CTM is not a precise determinant of the temperature tolerance of fish, it is an indicator of the temperature tolerance and can be used in thermal ecology studies as a measure of the ability of fish to acclimate to changes in temperature. THE BIOLOGY OF THE MARINE SPONGE MICROCIONA PROLIFERA (ELLIS AND SOLANDER). III. SPICULE SECRETION AND THE EFFECT OF TEMPERATURE ON SPICULE SIZE,

Hartford Univ., CT. Dept. of Biology.
T. L. Simpson.

Journal of Experimental Marine Biology and Ecology, Vol 35, No 1, p 31-42, 1978. 10 fig, 2 tab, 23 ref.

Descriptors: *Environmental effects, *Temperature, Aquatic animals, Growth rates, Sponges.

The deposition of silicon in Microciona prolifera is a diversified phenomenon involving a number of different processes with each of three major spicule types being secreted in a different fashion. In these studies, a clear relationship was shown between temperature and silicon deposition. The production of thicker spicules at lower temperatures suggest that the entrapment of transported silicon at the site of polymerization is more efficient at lower temperatures. During the growing season for this intertidal sponge water temperatures generally increase from about 14 to 23C and then decrease to about 16C with the result that spicule secretion within new growth areas is at different temperatures and a range of spicule thickness is seen. Little correlation between spicule length and temperature was found in these studies. (Chilton-ORNL)

5D. Waste Treatment Processes

CLEANING CONTAMINATED GROUND WATER.
Ground Water Age, Vol 13, No 4, p 28-30, December, 1978.

Descriptors: *Water pollution treatment, *Activated carbon, Groundwater barriers, Chemical warfare, Organic pesticides, Colorado, Rocky Mountain Arsenal.

Ground water contamination at the Rocky Mountain Arsenal near Denver, Colorado is being contained by a 1500-foot long underground water barrier and treated with a granular activated carbon system. The treated water is returned to the aquifer on the downstream side of the barrier through a dozen recharge wells. The treatment system's modular design allows for expansion to handle higher flow rates and more stringent water quality requirements in the future. Granular activated carbon's 'broad spectrum' treatment capability provides additional protection against the possible appearance of other dissolved organic contaminants in the ground water. Monitoring wells on both sides of the barrier will keep track of ground water quality and depth. Seasonal variations and changes due modifications in the operation of the treatment system will be studied. This pilot containment/treatment system will provide data needed to design and construct a permanent solution to the problem of contaminated ground water at the Rocky Mountain Arsenal. The techniques employed there will make a significant contribution toward the development of a practical technology for combating ground water contamination. (Purdin-NWWA)

EXPERIMENTS AIMED AT THE REMOVAL OF PHOSPHATE BY ELECTROCHEMICAL METHODS,
Vizgazdalkodasi Tudomanyos Kutato Intezet, Budapest (Hungary).
E. Dobolyi.
Water Research, Vol 12, No 12, p 1113-1116, 1978. 1 fig, 3 tab, 8 ref.

Descriptors: *Nutrient removal, *Electrochemistry, *Electrolysis, *Phosphates, *Aluminum, *Sewage treatment, Water pollution control, Chemical precipitation, Waste water treatment, Limiting factors, Hydrogen ion concentration, Phosphorus, Nutrients, Research equipment.

Electrochemical dissolution of aluminum is more efficient in removing phosphate from an experimental solution and from sewage than chemical precipitation with an aluminum sulfate solution containing an equal amount of aluminum, if the molar ratio of aluminum to phosphorus is greater than about 1.6. A probably explanation for the higher efficiency of electrolytically produced aluminum ions is that they de-chelate nascent aluminum, as opposed to aqueous solutions where aluminum is already present in the sulfate. In the experiments an electrolysis cell with separated electrode compartments was used to measure in different electrolyte solutions the amount of aluminum dissolved electrochemically in the anolyte by one A current during one min. This was 10-20% greater than that predicted by Faraday's law. The cathode was dissolved chemically, based on alkalinization of the electrolyte in the cathode compartment of the divided cell; the process was unaffected by the current intensity. Sheet aluminum of one mm thickness and 99.99% purity was used for the electodes. Equipment consisted of Plexiglas electrolysis cells, with each compartment having a volume of 1600 cu cm. Four sintered glass filters of G4 pore size separated compartments. Each electrode was submerged to an area of 88 sq cm, and a laboratory stirrer was operated in each compartment. (Lynch-Wisconsin)

ACUTE LETHALITY OF WASTEWATER DISINFECTION ALTERNATIVES TO JUVENILE RAINBOW TROUT (SALMO GAIRDNERI),
Environmental Protection Service, Burlington (Ontario). Waste Water Technology Centre.
V. W. Cairns, and K. Conn.
Research Report No. 92, 1979. 38 p, 4 fig, 10 tab, 22 ref.

Descriptors: *Disinfection, *Chlorination, *Ozone, *Ultraviolet radiation, *Bioassay, Rainbow trout, Dechlorination, Toxicity, Mortality, Waste water treatment, Municipal wastes.

Ninety-six-hour, continuous flow, juvenile rainbow trout bioassays were used to compare the toxicity of secondary municipal effluent before and after disinfection with chlorine, chlorine dioxide, ozone, and ultraviolet light. Non-disinfected secondary effluent was non-acutely lethal in 15 of 17 trials. Ozonated waste water was non-acutely lethal in five of six trials and effluent treated with ultraviolet light was non-acutely lethal in both trials conducted. Mechanical upsets in the treatment systems were responsible for mortalities in the non-disinfected and ozonated effluent trials. The 96-hr LC50's for chlorinated waste water ranged from 0.01-0.09 mg/liter and averaged 0.04 mg/liter as total residual chlorine while chlorine dioxide doses greater than 1 mg/liter produced acute lethality in 96 hrs. Chlorinated effluent was found more toxic than chlorine dioxide disinfection; both disinfected waste waters were non-acutely lethal after dechlorination with sodium sulfite or 24 hrs storage. (Lisk-Firl)

EVALUATION OF HIGH PERFORMANCE LIQUID CHROMATOGRAPHY PACKINGS FOR THE CONCENTRATION AND SEPARATION OF ORGANIC MATERIALS IN WATER,
American Univ., Washington, DC. Dept. of Chemistry.
A. Welebir, W. M. d'Angelo, S. W. Bigelow, and M. H. Aldridge.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A053 652, Price codes: A03 in paper copy, A01 in microfiche. Progress Report, November 28, 1977. 40 p, 7 fig, 5 tab, 44 ref. N00 173-76-C-0183.

Descriptors: *Waste water treatment, *Oil wastes, *Adsorption, *Gas chromatography, *Analytical techniques, Organic compounds, Separation techniques, Water purification, Water treatment, Aqueous solutions, Sea water, Saline water, Biodegradation, Pseudomonas.

The polymeric adsorbent amberlite XAD-4, a copolymer of styrene and divinyl benzene, was studied to determine its efficiency for extracting the dissolved oily wastes from sea water. The purification process required by the XAD-4 material is described. Standards were prepared in distilled water, synthetic sea water, and natural sea water. The adsorption efficiency of the standards from the aqueous solutions was determined by analyzing the solutions with liquid chromatography and aliphatic concentrations by an infrared technique before and after passage through the XAD-4 material. Retention efficiencies of 86 to 88% were obtained. The effects of flow rate, sample size and the weight of XAD-4 on retention efficiency are discussed. In a study for biodegradation by pseudomonas, naphthalene and beta naphthylamine were found to be biodegradable using a qualitative comparative gas chromatographic technique. Both compounds showed end products having the same retention times, suggesting similar mechanisms. Beta-naphthylamine's low biodegradation rate was attributed to the formation of an intermediate which accumulated in solution--the rate determining step. It is concluded that XAD-4 is an excellent trapping agent for trace amounts of organic compounds in water. (Davison-IPA)

WASTEWATER TREATMENT FOR REUSE AND ITS CONTRIBUTION TO WATER SUPPLIES,
District Columbia Dept. of Environmental Services, Washington.
H. P. Warner, and J. N. English.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 145, Price codes: A04 in paper copy, A01 in microfiche. Report No EPA-600/2-78-027, March 1978. 50 p, 7 fig, 20 tab, 11 ref. 68-03-0344.

Descriptors: *Water reuse, *Waste water treatment, *Pilot plants, *Treatment facilities, Potable water, Microorganisms, Organic compounds, Heavy metals, Inorganic compounds, Pesticides, Effluents, Water purification, Water purity, Water quality, Sampling, Radioactivity, Water pollution, Pollutant identification, Water pollution treatment.

The evaluation of a combined biological/physical-chemical pilot treatment system designed to produce a high quality reusable water is summarized. The 18 month study conducted at the EPA/Washington, D. C. Blue Plains Pilot Plant had as objectives: the identification of specific pollutants in the final effluent; an evaluation of individual process performances in removing these pollutants; and the provision of data concerning process and system variability and reliability regarding pollutant removals. Performance results showed the absence of virus in the effluent; concentrations of radioactivity, trihalomethanes and other volatile organics, heavy metals, pesticides, TOC, turbidity, and microbiological constituents were similar to those found in finished drinking waters during the EPA National Organics Reconnaissance Survey in 1975. Specific organic compounds identified in the effluent are also found in finished drinking waters. Result of an 80 element survey did not detect significant quantities of any hazardous inorganic material, and mutagenic properties were not exhibited in effluent organic concentrates. Endotoxin levels were found to be comparable to those of public drinking water supplies. The frequency distribution of the day to day concentrations of chemical, physical, and biological materials remaining in the effluent demonstrated treatment reliability. (Davison-IPA)

EFFECT OF ILLUVIATED DEPOSITS ON INFILTRATION RATES AND DENITRIFICATION DURING SEWAGE EFFLUENT RECHARGE,
Arizona Univ., Tucson. School of Renewable Natural Resources.
R. A. Herbert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 669, Price codes: A05 in paper copy, A01 in microfiche. Master of Science thesis, 1976. 71 p, 15 fig, 43 ref, 2 append. OWRT A-999-ARIZ(5), 14-34-0001-6003.

Descriptors: *Sewage effluents, *Denitrification, *Infiltration rates, *Recharge, *Ephemeral streams, Sewage, Nitrogen, Groundwater, Sewage disposal, Waste disposal, Sewage treatment, Arizona, Nitrates.

Ephemeral stream channels are used by some southwestern communities for disposal of sewage effluent. One of these communities is Tucson, Arizona. A column study was conducted to determine the interrelationships among nitrogen transformations, infiltration rates, and development of a black layer during sewage effluent recharge. Experiments included the packing of columns with river sand and continuously flooding them with sewage effluent. Infiltration rates and manometer readings were recorded daily and samples of inflow and outflow were collected and analyzed for the various nitrogen compounds. The results are presented. Infiltration rates decreased rapidly upon application of sewage. A black layer developed within a few days, the thickness of which was inversely related to the infiltration rate. There was no apparent relationship between black layer development and reduction in total nitrogen, but most of the nitrogen was in the wrong form for denitrification, making this part of the results inconclusive. The percent of total nitrogen removal was greater for lower infiltration rates. (Jamail-Arizona)

THEORY OF CLARIFIER OPERATION. I. QUIESCENT-HINDERED SETTLING OF FLOCCULATING SLURRIES,
Associated Water and Air Resources Engineers Inc., Nashville, TN.
J. H. Clarke, A. N. Clarke, and D. J. Wilson.
Separation Science and Technology, Vol. 13, No. 9, p 767-789, 1978. 9 fig, 51 ref, 7 tab.

Descriptors: *Clarifiers, *Operation and maintenance, *Mathematical models, Simulation, Flocculation, Separation techniques, Equations, Waste water treatment, Waste treatment, Water pollution treatment, Theoretical analysis, Computer models, Model studies.

The operation of quiescent (batch) clarifiers operating in the Class III mode (hindered settling) with flocculating slurries is simulated by a set of nonlinear partial differential equations, the continuity equations for the individual species of particles. The mathematical model predicts the expected response of the system to variation in input parameters (particle density, viscosity, particle size, clarifier height, percent solids, particle size distribution, and particle disruption rates). Disintegration of the larger particles by viscous drag forces is assumed to be first-order. The equations are integrated numerically for the case of batch settling, and the dependence of settling characteristics on the parameters of the model is studied. (See also W79-06113 and W79-06114) (Witt-IPC)
W79-06112

THEORY OF CLARIFIER OPERATION. II. HINDERED SETTLING OF FLOCCULATING SYSTEMS IN RECTANGULAR CLARIFIERS,
Vanderbilt Univ., Nashville, TN.
D. J. Wilson.
Separation Science and Technology, Vol. 13, No. 10, p 881-893, 1978. 2 fig, 3 ref, 6 tab.

Descriptors: *Clarifiers, *Operation and maintenance, *Mathematical models, Simulation, Flocculation, Separation technique, Equations, Waste water treatment, Waste treatment, Water pollution treatment, Model studies, Theoretical analysis, Computer models.

A mathematical model is presented for describing the steady-state operation of rectangular clarifiers. The model permits the examination of hindered settling of solids which are undergoing flocculation and floc disruption. The steady-state solution requires modest amounts of computer time and also lends itself to the analysis of quiescent settling in jar tests. Assumptions, possible expansions, and limitations of the model are discussed. (See also W79-06112) (Witt-IPC)
W79-06113

THEORY OF CLARIFIER OPERATION. III. SLUDGE BLANKET AND UPFLOW REACTOR-CLARIFIERS,
Vanderbilt Univ., Nashville, TN.
A. N. Clarke, D. J. Wilson, and J. H. Clarke.
Separation Science and Technology, Vol. 13, No. 10, p 895-915, 1978. 19 fig, 4 ref, 1 tab.

Descriptors: *Clarifiers, *Operation and maintenance, *Mathematical models, Sludge, Flocculation, Separation techniques, Equations, Waste water treatment, Waste treatment, Water pollution treatment, Model studies, Theoretical analysis, Computer models, Design.

The operation of three designs of axially symmetric continuous-flow upflow clarifiers is modeled by means of the continuity equations presented earlier. Class III operations (hindered settling) with flocculating slurries is considered, and the larger particles are permitted to disintegrate under the influence of viscous drag forces by a first-order process. The equations are integrated numerically, and the dependence of clarifier performance on clarifier type and hydraulic loadings is explored. Search applications to the design of clarifiers are suggested. (See also W79-06112) (Witt-IPC)

ANALYSIS OF SETTLING BASIN OPERATION IN THE PULP AND PAPER INDUSTRY (METSAETEOLLISUUDEN JAETEVESIEN SELKEYTYSALTAAT),
Valtion Teknillinen Tutkimuskeskus, Otaniemi (Finland). Reaktorilaboratorio.
R. Kuoppamaki, E. Ramo, and K. Passinen.
Paperi ja Puu, Vol. 60, No. 11, p 695-698, 701-702, November, 1978. 8 fig, 1 ref, 1 tab. English summary.

Descriptors: *Pulp wastes, *Settling basins, *Operation and maintenance, Pulp and paper industry, Waste water treatment, Effluents, Waste treatment, Water pollution treatment, Water pollution sources, Regression analysis, Optimization, Mathematical studies, Basins, Suspended solids.

In attempting to optimize the operation of pulp and paper industry effluent settling basins, prerequisites are the identification of the pertinent parameters and the quantitative determination of their effects on the solids-removal efficiency. A study was conducted to demonstrate the applicability of statistical methods to the analysis of effluent solids sedimentation. Correlation and regression analyses were used to interpret data from regular basin operating reports and time-series data obtained during a period of intensified basin input and output monitoring. The evaluation of regular report data provided information on the average solids-removal efficiency and its long-term variation. The short-interval multiparamete monitoring data led to conclusions regarding the dynamic characteristics of the basin and gave indications of the relative importance of various parameters to the overall efficiency of the process. The approach outlined seems to offer further developmental potential in data-processing and measurement techniques and has practical utility for improving the solids-removal efficiency of settling basins. (Brown-IPC)

EFFLUENT TREATMENT WITH ION-EXCHANGE RESINS (TRATAMENTO DE EFLUENTES POR RESINAS DE TROCA IONICA),
Rohm and Haas Brazil S.A.
A. Nunes de Oliveira.
O Papel, Vol. 39, p 51-58, August, 1978. 13 fig, 5 ref, 4 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Ion exchange, Resins, Wastes, Waste treatment, Industrial wastes, Water pollution treatment, Water pollution sources, Pulp and paper industry, Effluents, Economics, Reliability, Kraft mills.

A review is presented of the potential use of ion-exchange resins, such as Amberlite XAD-8, for the treatment of pulp and paper industry effluents. Data are reviewed showing such treatment to be particularly applicable to kraft pulp mill effluents, giving good economy, reliability, and simplicity of operation. The equipment is of compact modular design. The need to match such treatment systems to the individual requirements of a mill is emphasized. (Speckhard-IPC)

Treatment of pulp mill effluents with Ettringite (prepared by reacting aluminum sulfate with calcium hydroxide at pH 11 or higher) removed COD better than did alum and massive lime dosing. The resulting sedimentation sludge could be used in a closed-system operation. Changes of Ettringite compounds in this closed system were elucidated by x-ray analysis. Interferences by other compounds, such as silica and magnesium oxide, affect the operation of the closed system, and they should be removed. (See also W79-01758) (Brown-IPC)

COLOR REMOVAL FROM PULP MILL EFFLUENT USING FLY ASH ACIDIFIED WITH CHLORINATION STAGE EFFLUENT,
Saskatchewan Univ., Saskatoon.
D. N. Rao, N. N. Bakhshi, and D. G. MacDonald.
Canadian Pulp and Paper Association, Transactions of the Technical Section, Vol 4, No 3, p TR77-TR82, September, 1978. 5 fig, 6 ref, 5 tab.

Descriptors: *Decoloration, *Pulp wastes, *Waste water treatment, *Fly ash, *Bleaching wastes, Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Water pollution sources, Pulp and paper industry, Effluents, Aluminum, Iron, Calcium, Ions, Color, Chemical oxygen demand, Hydrogen ion concentration.

Aluminum, iron, and calcium ions are released from fly ash by acidification with the chlorination-stage effluent from a kraft bleach plant. The resulting slurry effectively removes the color from the caustic extraction-stage effluent. One gram of fly ash requires 157 ml of the chlorination-stage effluent to release the maximum amount of metal ions. Treatment of one liter of caustic extraction-stage effluent (color of 36,600 APHA units, COD of 4,220 ppm) with 2.3 g of fly ash acidified with 3.6 liters of chlorination-stage effluent (color of 650 APHA units, COD of 765 ppm) resulted in 93% color and 73% COD removals. The optimum pH for color removal is approximately 4.6. Acidification of fly ash with chlorination-stage effluent is not as effective as with HCl because the effluent pH of 1.64 is not low enough and the dissolved organic compounds in the effluent react with the metal ions. The mechanism of color removal and the behavior of the sludge obtained by this treatment are also briefly discussed. (Swichtenberg-IPC)

AERATED LAGOON TREATMENT OF BLEACHED KRAFT MILL EFFLUENTS AT HIGH TEMPERATURE,
British Columbia Research Council, Vancouver.
E. G.-H. Lee, J. C. Mueller, and C. C. Walden.
Canadian Pulp and Paper Association, Transactions of the Technical Section, Vol. 4, No. 1, p TR15-TR18, March, 1978. 4 fig, 12 ref, 6 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Aerated lagoons, *Temperature, Wastes, Industrial wastes, Waste treatment, Water pollution sources, Water pollution treatment, Biochemical oxygen demand, Toxicity, Lagoons, Suspended solids, Sludge, Pulp and paper industry, Effluents, Kraft mills.

Laboratory studies suggest that aerated lagoons for treating bleached kraft mill effluents perform satisfactorily up to about 45-50 C. Five-day BOD removal and detoxification efficiency begin to drop when temperatures exceed 50 C. The tendency of mixed liquor suspended solids (biomass) to disperse also increases at temperatures above 50 C, resulting in poor sludge settleability, sludge washout, and high suspended solids levels in effluents. (Switchenberg-IPC)

UTILIZATION OF SPENT SULFITE LIQUOR BY PEKILO FERMENTATION AND ULTRAFILTRATION,
Finnish Pulp and Paper Research Inst., Helsinki.
K. Forss, R. Kokkonen, H. Sirelius, and P.-E. Sagfors.
Canadian Pulp and Paper Association/TAPPI International Sulfite Conference, Montreal, Canada, September 12-14, 1978, Preprinted Proceedings (CPPA Technical Section, Montreal, Quebec, Canada), p 97-102. 11 fig, 3 ref.

Descriptors: *Sulfite liquors, *Waste water treatment, *Ultrafiltration, *Fermentation, Wastes, Industrial wastes, Pulp and paper industry, Effluents, Water pollution treatment, Water pollution sources, Waste treatment, Foreign countries, Europe, Lignins, Lignosulfonates, Industrial water, Proteins.

Protein can be produced from spent sulfite pulping liquors by means of the Pekilo process. A study has been made of the interaction of the Pekilo process with the ultrafiltration process to find possible advantages of their simultaneous application. The results show that fermentation of spent sulfite liquor prior to ultrafiltration permits a reduction in the size of the ultrafiltration installation needed for production of high molecular-weight lignosulfonates, and also diminishes the requirement of wash water, producing a filtrate which is suitable for concentration by hyperfiltration. (Swichtenberg-IPC)

BIOLOGICAL CONTROL ALTERNATIVES FOR A SULFITE MILL (EFFLUENT),
Finnish Pulp and Paper Research Inst., Helsinki.
E. Meloni.
Canadian Pulp and Paper Association/TAPPI International Sulfite Conference, Montreal, Canada, September 12-14, 1978, Preprinted Proceedings (CPPA Technical Section, Montreal, Quebec, Canada), p 81-86. 4 fig, 7 ref, 4 tab.

Descriptors: *Sulfite liquors, *Biological treatment, *Waste water treatment, Pulp wastes, Wastes, Industrial wastes, Water pollution treatment, Water pollution sources, Pulp and paper industry, Effluents, Foreign countries, Europe, Yeasts, Candida utilis, Proteins, Alcohols, Biochemical oxygen demand, Phosphorus compounds, Nitrogen compounds, Capital costs, Operating costs, Costs, Waste treatment, Water pollution control, Finland, Condensates, Sulfite pulp mill, Ethanol, Sulfite alcohol.

Biological treatment and the manufacture of ethanol, Torula (Candida utilis) yeast, or Pekilo protein were evaluated as alternative methods for the pollution control of evaporator condensates from a sulfite pulp mill. All of these processes, with the exception of alcohol manufacture, reduce the organic matter (BOD) discharged from the mill, but increase the discharge of phosphorus and nitrogen. Although biological effluent treatment involves the lowest capital and operating cost, it remains the most expensive alternative, since the other methods yield a saleable product. (Swichtenberg-IPC)

PILOT PLANT STUDIES OF BIOLOGICAL TREATMENT OF MAGNESIUM-BASE SULFITE MILL EFFLUENT--AERATED STABILIZATION BASIN AND ROTATING BIOLOGICAL SURFACE,
Ontario-Minnesota Pulp and Paper Co., Ltd., Fort Frances.
C. D. Baker, R. H. Nachbar, and R. E. Summer.
Canadian Pulp and Paper Association/TAPPI International Sulfite Conference, Montreal, Canada, September 12-14, 1978, Preprinted Proceedings (CPPA Technical Section, Montreal, Quebec, Canada), p 69-80. 4 fig, 12 ref, 3 tab.

Descriptors: *Sulfite liquors, *Waste water treatment, *Biological treatment, Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Water pollution sources, Pulp wastes, Pulp and paper industry, Effluents, Foreign countries, Canada, Biochemical oxygen demand, Aerated lagoons, Oxidation lagoons, Nutrients, Suspended solids, Sludge, Lagoons, Newsprint mills, Spent sulfite liquor, Rotating biological contactor.

Magnesium-base spent sulfite liquor (SSL) was pretreated with aqueous ammonia and phosphoric acid and biologically treated in an aerated stabilization basin (ASB) at loadings of 4 and 12 lb BOD/1000 cu ft/day for retention periods of 20 and 7 days, respectively. This 2-yr study was carried out at a Canadian integrated newsprint mill during both summer and winter months. BOD reductions were satisfactory. The influence of nutrients on BOD reduction was determined. Basin suspended solids were higher at the shorter residence time. Column settleability tests showed that about 50% of the effluent solids were readily settleable but upflow rates less than 625 gal/day-ft would be needed to remove most of the solids. Filter leaf tests revealed that the settled solids would be difficult to dewater on a vacuum filter. It was concluded that BOD reduction in an ASB is feasible but solids clarification and sludge dewatering make the process impractical. Similar studies on the BOD reduction of SSL were conducted with a rotating biological contactor (RBC). Although BOD reductions of over 80% were achieved on occasion, the overall performance of the unit was erratic. Because the unit had an integral clarifier, sludge settleability was not adequately characterized. The settled sludge showed wide variations in its characteristics. The RBC performance was very sensitive to fluctuations in feed properties. (Swichtenberg-IPC)

ASSESSMENT OF THE ABILITY OF BIOLOGICAL TREATMENT TO DETOXIFY EFFLUENTS FROM SULFITE MILLS PRACTICING CHEMICAL RECOVERY,
Beak Consultants Ltd., Montreal (Quebec).
S. Schneiderman, and G. A. Allard.
Canadian Pulp and Paper Association/TAPPI International Sulfite Conference, Montreal, Canada, September 12-14, 1978, Preprinted Proceedings (CPPA Technical Section, Montreal, Quebec, Canada), p 49-58. 12 ref, 16 tab.

Descriptors: *Pulp wastes, *Sulfite liquors, *Waste water treatment, *Biological treatment, Detoxifica-

tion, Wastes, Industrial wastes, Water pollution treatment, Toxicity, Water pollution sources, Waste treatment, Pulp and paper industry, Effluents, Activated sludge, Aerated lagoons, Biochemical oxygen demand, Operation and maintenance, Design, United States, Chemical recovery, Spills, Sulfite pulp mills.

According to a survey of seven U.S. sulfite pulp mills, aerated lagoon systems and activated sludge treatment are capable of effluent detoxification irrespective of the form of chemical recovery. Four of the 7 treatment systems detoxified irrespective of the form of chemical recovery. Four of the 7 treatment systems detoxified 100% of the time; the remaining 3 mills exhibited lesser degrees of detoxification frequency. BOD removal was generally good, ranging from 73 to 91%, except at two mills where the BOD removals were 45 and 60%. Proper design and operation and frequency and duration of liquor spill strongly affect the ability of biological treatment to detoxify sulfite mill effluents. No consistent relationship was found between pulping base or wood species and detoxification. (Swichtenberg-IPC)

PURIFICATION OF HIGH-ASH WASTEWATERS IN FLOTATION SAVEALLS (OCHISTKA VYSOKOZOL'NYKH STOCHNYKH VOD NA FLOTATSIONNYKH LOVUSHKAKH),
Vsesoyuznyi-Nauchnyi Planovii Otdel Bumazhnoi Promyshlennost, Moscow (USSR).
V. A. Kopylov.
Bumazhnaya Promyshlennost', No. 10, p 28-29, October, 1978. 2 fig, 1 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Flotation, Wastes, Pulp wastes, Industrial wastes, Water pollution treatment, Waste treatment, Water pollution sources, Pulp and paper industry, Effluents, Aeration, Water purification, Suspended solids, White water(Paper machines), Savealls, Aluminum oxide, Polyacrylamide, Rosin.

A study of ways to increase the efficiency of flotation savealls, so that they can be used for treatment of white water from the manufacture of high-ash content papers, showed that the air can be utilized more effectively when the tank inlet is located tangentially near its bottom; the height of the head tank should not exceed 10-12 m. A further increase of saveall efficiency can be achieved by the addition of chemical agents (aluminum oxide, polyacrylamide, and rosin size) in doses depending on the suspended solids content. With a combination of these chemicals, a degree of purification of up to 99% was obtained for effluent containing up to 4,800 mg/liter of suspended solids. (Stapinski-IPC)

OXIDATIVE TREATMENT OF INDUSTRIAL WASTEWATER,
Industrial Environmental Research Lab.-Cincinnati, Edison, NJ.
F. Ellerbusch, and H. S. Skovronek.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 268, Price codes: A02 in paper copy, A01 in microfiche. Technical Report EPA-600/J-77-057. 1977. 9 p, 7 fig, 3 tab, 55 ref.

Descriptors: *Industrial wastes, *Oxidation, *Waste treatment, *Performance, *Costs, Oxidation lagoons, Activated sludge, Incineration, Aerated lagoons, Ozone, Electrolysis.

Oxidative industrial waste treatment processes are defined, categorized, and discussed. Biological, chemical, and thermal methods, categorized as oxidative destruction, reductive destruction, and nondestructive, separation processes, are considered. Advantages, disadvantages, and generalized cost comparisons are presented. Energy use or production is also considered. US Environmental Protection Agency projects are identified as examples. Some systems discussed include activated sludge, sludge incineration, multiple oxidation channels, oxidation pond, aerated lagoon, and the PACT system. Ozone treatment of electroplating wastes, alkaline oxidation pulping, and electrolytic oxidation of plating wastes, are outlined. (Small-FIRL)

PROCESSING RAW SEWAGE BY ULTRAFILTRATION,
David W. Taylor Naval Ship Research and Development Center, Bethesda, MD.
L. R. Harris, and C. M. Adema.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 607, Price codes: A02 in paper copy, A01 in microfiche. Report MAT-77-79. April 1977. 15 p, 2 fig, 5 tab, 25 ref.

Descriptors: *Filtration, *Membranes, *Membrane processes, *Sewage effluents, *Water quality standards, Water pollution, Waste water treatment, Waste water disposal, Suspended solids, Coliforms.

Four filtration configurations were evaluated for the treatment of raw sewage to produce effluent which meets discharge regulations for marine sanitation devices. One microfiltration unit and nine ultrafiltration systems were operated and four filtration configurations were tested: tubular, hollow fiber, spiral wound, and plate and frame. Pretreatment and cleaning requirements for each system were assessed. Parameters evaluated for each system included relative flux decline, maintenance, rejection of fecal coliforms, and removal of suspended solids. The 1980 effluent discharge standard requires that waste water contain <150 mg/liter of suspended solids and <200 fecal coliform bacteria per 100 ml. All the systems investigated produced an effluent which met the suspended solids limitations and all but two systems produced effluent that met the coliform requirements. Further research with non-cellulosic tubular membranes with a 1-inch interior diameter and with hollow fiber membranes in conjunction with a biological oxidation system was recommended. Comparison of these systems with a plate and membrane design was also suggested. (Lisk-FIRL)

CONTROL OF VIRUS PATHOGENS IN MUNICIPAL WASTEWATER AND RESIDUALS BY IRRADIATION WITH HIGH ENERGY ELECTRONS,
New Hampshire Univ., Durham. Dept. of Microbiology.
T. G. Metcalf.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 347, Price codes: A04 in paper copy, A01 in microfiche. 1977. 64 p, 18 fig, 2 tab, 19 ref.

Descriptors: *Radiation, *Waste water treatment, *Disinfection, *Viruses, *Sewage treatment, Performance, Seasonal, Water pollution.

Electron radiation was used to disinfect waste water based on inactivation of enteric viruses. Trials with an in-line installed radiation unit at the city of Boston's Municipal Waste Treatment Plant on Deer Island confirmed results obtained at the High Voltage Research Laboratory, MIT. Radiation doses needed for disinfection were calculated from D(10) values determined for test enteric viruses and natural virus numbers found per unit volume of a vwaste water residual. Disinfection of fresh raw sewage was estimated to require at least 400 kilorads/ml doses. As much as 600 kilorads/ml may be required during the summer months, based on peak concentrations of 1000 PFU/ml. Disinfection of waste water effluents was estimated to require a maximum of 400 kilrads/gal. Acid adjustment of a residual pH 3.7 or addition of aluminum or ferric chlorides, enhanced radiation effectiveness. Also, a method was developed for recovery of test virus from large volumes of digested sludge which permitted recoveries of 50% of test virus incorporated into five gal samples. (Small-Firl)

ALUM ADDITION AND STEP-FEED STUDIE IN OXYGEN-ACTIVATED SLUDGE,
Department of Environmental Services, Washington, DC.
D. F. Bishop, J. A. Heidman, R. C. Brenner, and B. Stamberg.
Available from the National Technical Informatic Service, Springfield, VA 22161 as PB-272 89 Price codes: A03 in paper copy, A01 in microfich Report EPA-600/2-77-166, 1977. 31 p, 6 fig, 10 ta 10 ref.

Descriptors: *Activated sludge, *Oxygen requir ments, *Performance, *Suspended solids, *Pho phorus, Lime, Municipal wastes, Sludge treatmen

A plug flow, oxygen-activated sludge process wa operated with alum addition to remove phosphor and with lime addition to prevent the process p from decreasing below 6.4. The pollutant remova from the primary effluent ranged from 82 to 92 for BOD (7.4 to 19 mg/liter of residual BOD from 52 to 84% for suspended solids (17 to 56 mg liter of residual suspended solids), and from 54 t 86% for phosphorus (1.05 to 3.26 mg/liter of resid ual P). Optimum P removal occurred at a 1.8 to average Al/P ratio with an average total residual of 1.05 mg/liter. In the second phase of the study the oxygen-activated sludge process was operate in a step-feed configuration consisting of a sludg oxygenation stage followed by three stages o oxygen aeration with equal portions of the primar effluent fed to each stage. The step configuratio clearly reduced the solids loading to the clarifie and provided an average process MLSS of mor than 6500 mg/liter. Excellent BOD removal wa realized with the step operation. Eighty-nine per cent removal from the primary effluent resulte with an effluent BOD of 10 mg/liter and a solubl filtered effluent of less than 3 mg/liter. The COI and suspended solids residual averaged 43 mg/lite and 23 mg/liter, respectively. Oxygen usage in th step configuration was significantly less than th 90% typically achieved in co-current contacting (Small-FIRL)

ACTIVATED CARBON TREATMENT O KRAFT BLEACHING EFFLUENTS,
Saint Regie Paper Co., Cantonment, FL.
E. W. Lang, J. W. Stephens, and R. L. Miller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 078 Price codes: A04 in Paper copy: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-119, 1977. 54 p, 12 fig, 6 tab, 12 ref, append

Descriptors: *Pilot plants, *Activated carbon, *Color, *Organic matter, *Bleaching wastes, Pulp and paper industry, Pulp wastes, Costs, Performance, Adsorption.

A pilot plant study investigated the removal o color and organic contaminants from kraft pulp bleaching plant effluent by adsorption in activated carbon. The caustic bleach effluent, which contains 80% of the color from pulp bleaching, was decolorized when pH was adjusted to 2.5. The spent carbon could be regenerated with caustic solution for an average of 11 adsorption-regeneration cycles before thermal regeneration was necessary. The pH of feed, feed rate, effluent from bleaching of hardwood and softwood, caustic requirements for regenerating the carbon, and concentration of color in feed, were studied. The process was technically sound. It can remove 94% of the color and 84% of the total organic carbon from caustic bleach effluent from the bleaching of softwood. Capital and operating cost estimates are presented for full-scale plants. Variations in design and their cost effects are discussed. The process is generally more expensive than alternative processes for reducing color such as resin adsorption, ultrafiltration, or bleach sequence modification. (Small-Firl)

POWDERED ACTIVATED CARBON ADDITION AT THE WOODSTOCK WATER POLLUTION CONTROL PLANT,

Gore and Storrie Ltd., Toronto (Ontario).
T. Alkema, and R. Luscombe.
Ministry of the Environment, Ontario Technical Report E.01. 1978. 20 p, 1 fig, 7 tab.

Descriptors: *Activated carbon, *Waste water treatment, *Granules, *Pilot plants, *Performance, Biochemical oxygen demand, Color, Oxidation, Ammonia.

A pilot plant study of the effectiveness of powdered activated carbon (PAC) addition to the secondary treatment section at the Woodstock Water Pollution Control Plant was conducted. PAC was added daily to both plant aeration cells. A sampling and analysis program determined the impact of the PAC addition over an 18 wk period. Good operating results were obtained. No significant improvement in BOD removal was found. PAC had no impact on heavy metal removal. Color removal in the secondary treatment section as much improved with PAC addition. Also, oxidation of NH3-N was improved. This increased ammonia removal which was important at this particular plant because a large percentage of the effluent TOD is normally contributed by the nitrogenous oxygen demand. (Small-Firl)

CHARACTERISTICS OF EFFLUENTS FROM SEPARATE SEPTIC TANKS TREATING GREY WATER AND BLACK WATER FROM THE SAME HOUSE,
Ontario Ministry of the Environmental, Toronto. Pollution Control Branch.
M. Brandes.
Technical Report W 68, 1977. 32 p, 3 fig, 6 tab, 30 ref.

Descriptors: *Waste water treatment, *Septic tanks, *Domestics wastes, Sludge, *Performance, Sewage, Coliforms, Phosphorus, Nitrogen, Soil filters.

The chemical and bacteriological characteristics of septic tank effluents from two separate tanks used by one house for grey water and black water (toilet) treatment were studied for nine months. The household used only phosphorus free detergents. For the grey water septic tank effluent, the concentrations of total phosphorus and total Kjeldahl nitrogen were 1.4 and 11.3 mg/liter, respectively. These values are about 10 times lower than the toilet waste water septic tank effluent. Total and fecal coliform organisms in the grey water septic tank were higher than in the effluent from the toilet septic tank. Grey water levels were 24,000,000 and 1,400,000 ml, respectively. The effect of soil filters on removal of chemical and bacteriological contaminants from the septic tank effluents is discussed. Sludge accumulation rates were determined: 8.3 liters/person/yr for the grey water tank and 65.7 liters/person/yr for the toilet water septic tank. Grey water septic tank cleaning were about 8 to 10 times less frequent than recommended time intervals for normal household septic tanks. (Small-FIRL)
W79-06161

NITRIFICATION OF A SECONDARY MUNICIPAL EFFLUENT USING A ROTATING BIOLOGICAL CONTACTOR,
Ontario Ministry of the Environment, Toronto. Waste Water Treatment Section.
T. Hewitt.
Research Publication 71, 1978. 41 p, 11 fig, 6 tab, 25 ref, 1 append.

Descriptors: *Municipal wastes, *Nitrification, Rotational flow, *Mechanical equipment, Hydraulics, Aerobic bacteria, Oxidation, *Ammonia, *Aerobic treatment, Waste water treatment, Performance.

The feasibility of using the Rotating Biological Contactor (RBC) process for biological nitrification of a non-nitrified, secondary municipal effluent was evaluated. Tests were conducted in both summer and winter in Ontario which established that the RBC process could produce a consistent, well-nitrified effluent. During summer tests, nitrification efficiency decreased as hydraulic loading was increased from 0.8 Imperial gpd/sq ft to 3.2 Imperial gpd/sq ft. A hydraulic loading of 3.2 Imperial gpd/sq ft produced an effluent of 0.77 mg/liter average NH3-N, with 71% of the effluent samples containing less than 1 mg/liter NH3-N. As disc rotational speed increased from 1 rpm to 2 rpm, nitrification efficiency increased. During winter, at constant hydraulic loading, nitrification efficiency decreased as waste water temperature decreased. A hydraulic loading rate of 2.4 Imperial gpd/sq ft produced an effluent of 1.05 mg/liter average NH3-N with 79% of the effluent samples containing less than 2 mg/liter NH3-N. Total recovery of nitrification was limited and recovery time was lengthy after two successive upsets. (Small-FIRL)
W79-06162

THE RELATION OF SOIL CHARACTERISTICS TO THE FAILURE OF DOMESTIC WASTE-WATER DISPOSAL SYSTEMS,
Vermont Univ., Burlington.
F. R. Magdoff.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 809, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Center Technical Completion Report, April 1979. 46 p, 11 fig, 11 tab, 26 ref. OWRT A-025-VT(1).

Descriptors: *Waste water disposal, *Septic tanks, Soil clogging, Mound systems, Clay soils.

Laboratory and field experiments were conducted to assess design criteria and performance of mound systems for septic tank effluent disposal on clay soils. Laboratory experiments indicated that the mound fill might clog if high rates of effluent application are used (greater than 3 cm/day) or the height of fill is insufficient to allow for well oxidized conditions near the infiltrative surface of the fill. Thirty centimeters of fill or more appear necessary to reduce the development of clogging. Clogged surfaces could recover infiltrative capacity if they were allowed to rest under aerobic conditions. Field experiments clearly showed the superiority of mound systems to subsurface disposal, especially during wet years. Moisture tension patterns in the fill of mound systems indicated that while during the winter clogging of the infiltrative surface may begin, summer conditions appear to cause a recovery of the infiltrative capacity. At no time was seepage noted around the experimental mound systems.

COST ESTIMATES FOR CONSTRUCTION OF PUBLICLY-OWNED WASTEWATER TREATMENT FACILITIES, 1976 NEEDS SURVEY. VOLUME 1,
Environmental Protection Agency, Washington, DC. Office of Water Program Operations.
J. A. Chamblee.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 717, Price codes: A05 in paper copy, A01 in microfiche. Report 430/9--76--010, 1977. 62 p, 41 tab, append.

Descriptors: *Costs, *Waste water treatment, *Public utilities, Sewers, Infiltration, Storm runoff, Overflow, Rehabilitation.

Cost estimates are presented for needed publicly-owned waste water treatment facilities as part of a report to Congress. Eight categories are covered: Secondary treatment, Higher than secondary treatment, Correction of infiltration/inflow, Major rehabilitation of sewers, New collector sewers, New interceptor sewers, Control of combined sewer overflow, and Treatment and/or control of stormwaters. EPA's assessment of the need for construction of municipal wastewater treatment facilities to serve 1990 populations is $95.9 billion in categories 1-5, and an additional $54.1 billion for control of stormwaters. The states' estimate for the same needs are $100.4 billion for the first five categories and $57.2 billion for stormwaters control. (See also W79-06324) (Small-FIRL)
W79-06323

COST ESTIMATES FOR CONSTRUCTION OF PUBLICLY-OWNED WASTEWATER TREATMENT FACILITIES. VOLUME 2. SUMMARIES OF TECHNICAL DATA CATEGORIES I-IV. 1976 NEEDS SURVEY,
Environmental Protection Agency, Washington, DC. Municipal Construction Div.
J. A. Chamblee.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 718, Price codes: A05 in paper copy, A01 in microfiche. Report 430/9--76-011, 1977. 81 p, 8 fig, 26 tab, 2 append.

Descriptors: *Costs, *Waste water treatment, *Public utilities, Sewers, Infiltration, Storm runoff, Overflow, Rehabilitation.

Technical data are presented from the 1976 Needs Survey for Waste Water Treatment Facilities as a supplement to the Cost Estimate Report to Congress. Categories of needs include: Secondary treatment and best practicable waste water treatment technology, More stringent treatment, Infiltration/inflow correction, Sewer system replacement or major rehabilitation, New collectors and appurtenances, New interceptors and appurtenances, Correction of combined sewer overflow, and Treatment and/or control of stormwater. (See also W79-06323) (Small-FIRL)

DEWATERING SEWAGE SLUDGE BY ELECTRO-OSMOSIS. PART 1. BASIC STUDIES,
Electricity Council Research Centre, Capenhurst (England).
J. G. Sunderland.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 411, Price codes: A03 in paper copy, A01 in microfiche. Report, 1976. 26 p, 6 fig, 7 tab, 7 ref, 1 append.

Descriptors: *Electro-osmosis, *Sludge treatment, *Dewatering, *Electrodes, *Polymers, Sewage sludge, Design criteria, Performance, Municipal wastes.

The thickening of sewage sludge by electro-osmosis on a continuous basis was found feasible in laboratory-scale experiments. Sewage sludge from an anaerobic digester was used in the study and contained about 3% solids. The types of dewatering apparatuses tested included: a cylindrical cell with horizontal parallel electrodes, a dipped cell configuration, a rotating drum cell, and a moving belt cell. Applied voltage ranged from 10-30 volts at pumping rates which varied from 1.92-11.4 ml/min. Employing a fixed and a moving polymer mesh belt (1 cm/15-20 sec) at pumping rates of 4.0-5.2 ml/hr/sq cm, a final solids content of 26-28% was achieved. Currents applied ranged from 3.0-5.6 amps; power requirements correlated closely with the initial solids content of the sludge. The laboratory experiments indicated there would be no problems with scale-up of the electro-osmosis dewatering procedure. Polymer mesh belts drawn across static vertical cathodes were considered feasible on a commercial-plant scale. (See also W79-06326) (Lisk-FIRL)
W79-06325

DEWATERING SEWAGE SLUDGE BY ELECTRO-OSMOSIS. PART II SCALE-UP DATA,
Electricity Council Research Centre, Capenhurst (England).
D. Ellis, and J. G. Sunderland.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 412, Price codes: A02 in paper copy, A01 in microfiche. Report 1977. 25 p, 7 fig, 6 tab, 2 ref.

Descriptors: *Dewatering, *Sewage treatment, *Electro-osmosis, *Performance, *Costs, Electrodes, Design, Biochemical oxygen demand, Chemical oxygen demand, Sanitary engineering.

A project scale rig for the electro-osmotic dewatering of sewage was constructed. The moving belt and vertically disposed electrodes minimize floor area requirements and permit continuous removal

of solids from the electrode surface, eliminating batch operation. The rate of dewatering and hence the current can be maintained essentially constant, at constant voltage. A sewage cake of about 24% solids was achieved, together with effluent low in COD and BOD. Cost comparisons are made between different methods of sludge dewatering. Electrokinetic costs are related to initial solids concentration, and compare favorably with conventional techniques at and above about 8% initial solids. The process is probably not appropriate for the sewage treatment market, although much of the technology is relevant to the dewatering of other materials such as ball clay. W79-06326

ADVANCED TREATMENT APPROACHES FOR METAL FINISHING WASTEWATERS. PART I,
Industrial Environmental Research Lab.-Cincinnati, Edison, NJ.
H. S. Skovronek, and M. K. Stinson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 147, Price codes: A02 in paper copy, A01 in microfiche. Report EPA-600/J-77-056a, 1977. 8 p, 12 fig, 1 tab, 27 ref.

Descriptors: *Industrial wastes, *Metallurgy, *Water pollution sources, *Ion exchange, *Electrolysis, Evaporation, Adsorption, Pilot plants, Chromium, Zinc, Nickel, Copper.

New technologies for the control, recycle, and destruction of water pollutants generated in the electroplating and related industries, are described. Ion exchange, evaporation, cementation, electrolytic processes, advanced chemical techniques, treatment of fluoborates, carbon adsorption, and starch xanthate, are discussed. Results of industrial and EPA pilot tests are presented. Pollutants being controlled are primarily: cyanide, chromium, zinc, nickel, and copper. An ion exchange process to recover aluminum from phosphoric acid waste generated by bright finishing of aluminum parts, is described, as is the Reciprocating Flow Ion Exchange method. An electrolytic technique based on semiconductive beds of carbon particles for the reduction of hexavalent chromium and the oxidation of cyanides, was evaluated. Advanced chemical techniques include the Kastone process with zinc recovery, and the Sulfex process. (See also W79-06328) (Small-FIRL)
W79-06327

ADVANCED TREATMENT APPROACHES FOR METAL FINISHING WASTEWATERS PART II,
Industrial Environmental Research Lab.-Cincinnati, Edison, NJ.
H. S. Skovronek, and M. K. Stinson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 148, Price codes: A02 in paper copy, A01 in microfiche. Report EPA 600/J-77-0566 1977. 5 p, 8 fig, 1 tab, 46 ref.

Descriptors: *Industrial wastes, *Water pollution sources, *Reverse osmosis, *Electrodialysis, *Membrane processes, Separation techniques, Solvent extractions, Freezing, Costs, *Performance, Sludge treatment.

New technologies for the control, recycle, and destruction of water pollutants generated in the electroplating and related industries, are described. Reverse osmosis, electrodialysis, newer membrane techniques, solvent-based systems, and freezing are considered. The advantages of reverse osmosis techniques include low capital cost, low space requirements, and low labor costs. Results of EPA tests with three new membranes were encouraging for PA-300, PBIL, and NS-100. A successful application of electrodialysis to nickel recovery is related as is unsuccessful attempt to recover cyanide. Donnan dialysis is being developed and shows promise in chromate and copper treatment. The ZDS system is described which utilizes a combination of countercurrent rinsing and displacement by immiscible fluids to separate dissolved chemicals from rinse water, is described. Freezing is discussed as a possible future treatment method. Control options for sludge are considered briefly. (See also W79-06327) (Small-FIRL)
W79-06328

EVALUATION OF A VAPOR COMPRESSION DISTILLATION UNIT FOR LAUNDRY WASTEWATER REUSE,
Army Medical Bioengineering Research and Development Lab., Fort Detrick, MD.
J. J. McCarthy, and R. H. Chyrek.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A045 765, Price codes: A03 in paper copy, A01 in microfiche. Technical Report 7711. 1977. 44 p, 10 fig, 10 tab, 6 ref.

Descriptors: *Recycling, Waste water treatment, *Distillation, Domestic water, *Laundering, Testing, *Performance, *Mechanical equipment, Water quality, Energy, Maintenance.

A nominal 6 gph vapor compression distillation unit (VCDU) built by Chemtric, Inc. of Rosemont, IL, was evaluated using laundry waste water. Product water quality and energy use rates were determined, and operation and maintenance were monitored for a 16 wk period. Product water quality from the laundry waste water feed when compared with tap water was lower in turbidity, total solids, and conductivity, but higher in total organic carbon and chemical oxygen demand. When all heat was supplied solely by vapor compression, there was minimum energy use. Use of the storage tank heater caused maximum energy use. In actual operation, use of the storage tank heater averaged 655 watt/hr/gal of water produced. Energy use rates were generally high because of intermittent unit operation, lack of adequate operator controls, and severe maintenance problems. Energy use requirements were elevated by poor heat transfer conditions caused by varying water levels and convective currents in the sump and storage tanks. Operation of the VCDU was stopped when foam from the concentrated waste water began to carry-over into the product water in spite of a foam entrainment control medium. When foam carry-over became consistent, product water quality deteriorated rapidly. (Small-FIRL)

CONCEPTUAL DESIGN OF A PILOT WASTEWATER IRRADIATION FACILITY,
Army Facilities Engineering Support Agency, Fort Belvoir, VA.
C. Everline.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A047 788, Price codes: A07 in paper copy, A01 in microfiche. Final Report, 1977. 226 p, 36 fig, 21 tab, 1 append.

Descriptors: *Irradiation, Radiation, *Waste water treatment, *Sewage treatment, *Pilot plants, *Design, Microorganisms, Sampling.

The design of a pilot waste water irradiation treatment plant is presented and discussed. To determine the effects of gamma irradiation on all phases of sewage treatment, the facility should be connected to an operating waste plant in such a manner that influent sewage can be sampled as well as primary, secondary, and tertiary effluent. Initial waste water composition will be analyzed for microbe concentration, surfactants, phenols, dissolved oxygen, and free chlorine. In the mixing and holding tank, the sewage could be chemically treated before irradiation. Irradiation time will be limited by a flow meter, and a recycle loop can be utilized. All effluent will be passed through a radiation monitor before being discharged. Plant layout and radiological protection are described, as are peripheral equipment design and source selection. Nuclear design of the irradiator is also described. (Small-FIRL)

TOXICOLOGICAL INVESTIGATIONS O PILOT TREATMENT PLANT WASTEWATER AT HOLSTON ARMY AMMUNITION PLANT
Battelle Columbus Labs. Columbus, OH.
J. M. Stilwell, M. A. Eischen, W. L. Margard, M. C. Matthews, and T. B. Stanford.
Available from the National Technical Informatio Service, Springfield, VA 22161 as AD-A042 60 Price codes: A04 in paper copy, A01 in microfich Final Report July 27, 1977. 46 p, 11 fig, 11 tab, 2 ref, 2 append.

Descriptors: *Chemical wastes, *Trickling filter *Activated sludge, *Toxicity, *Biological trea ment, Lethal limit, Industrial wastes, Chemic oxygen demand, Nutrients, Waste water trea ments, Pilot plants, Bioassay, Chemical analysi

Several waste waters from effluent streams at th Holston Army Ammunition Plant were treated i an activated sludge chamber or in a trickling filte followed by activated sludge treatment; treate effluent was subjected to 96-hour acute LC50 bio assay tests with fathead minnows to determin toxicity. The pilot plant tests were conducted o two effluent streams mixed in a ratio of 1:9 b volume; one effluent sample was composed o waste water from 10 effluent sources while th second was a mixture of four samples plus synthet ic wastes added to increase the COD to 400 mg liter. The wastes were either treated by the activat ed sludge method or passed through a tricklin filter prior to activated sludge treatment. Bioassa tests were conducted for each individual wast water, the mixture of both effluents, effluent fro the activated sludge treatment, and effluent fro the combined treatment. The toxic effects of th waste waters were correlated with high levels o HMX, COD, BOD, pH, NH3, TKN, PO4, NO and total solids. LC50 values of the first wast stream indicated it was the most toxic at a value o 1%. The second effluent had LC50 values rangin 6.2-43.8% while the combined wastes has LC5 values from between 1.43-14.0%. The treate waste water exhibited significantly lower toxicity with LC50 values of >70%. The levels of RDX i the effluents were not considered toxic in the bio assay tests. Biological treatment of ammunitio waste waters was considered suitable for reducin toxicity. (Lisk-Firl)

THE ROLE OF SEWAGE LAGOONS AT CORPS OF ENGINEERS RECREATION AREAS,
Army Engineering Waterways Experiment Sta tion, Vicksburg, MS. Environmental Effects Lab T. D. Hand, and R. R. Williams.
Available from the National Technical Informatio Service, Springfield, VA 22161 as AD-A047 833 Price codes: A04 in paper copy, A01 in microfiche Final Report 1977. 55 p, 6 tab, 66 ref, append

Descriptors: *Sewage lagoons, *Performance *Seasonal, Design, Recreation, Aerated lagoons Sewage treatment, Algal control.

The role of Corps of Engineers recreation are sewage lagoons was assessed by reviewing curren technology and current Corps needs. A literatur review was conducted to determine design, oper ation, and upgrading methods which could be ap plicable to the special loading problems and othe characteristics of recreation area sewage lagoons Also, a survey established the geographic distribu tion and the design and performance successes and failures of the 200 lagoons. Facultative lagoon were well suited to seasonal recreation areas. Me chanical aeration can be used to upgrade over loaded lagoons. Anaerobic lagoons were not usefu for this application. Where annual evaporation ex ceeds precipitation, total retension lagoons were successful. In northern areas, controlled discharge was effective, but this needs to be developed in warm, humid areas. Phase isolation seems to be a promising development, but it has not been evalu ated sufficiently. Effective methods for removing algal solids are reviewed. Most Corps lagoons are operating at hydraulic and organic loads far below design levels. (Small-Firl)

DECONTAMINATION OF WATER CONTAINING CHEMICAL AND RADIOLOGICAL WARFARE AGENTS BY REVERSE OSMOSIS,
Army Mobility Equipment Research and Development Command, Fort Belvoir, Va. Energy and Water Resources Lab.
D. C. Lindsten, and P. R. DesRoches.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A046 203, Price codes: 04 in paper copy, A01 in microfiche. Report June 1977. 66 p, 16 fig, 31 tab, 1 append.

Descriptors: *Chemical wastes, *Radioactive wastes, *Reverse osmosis, *Membranes, *Potable water, Sea water, Brackish water, Water pollution, Cesium, Iodine, Strontium, Chemical warfare, Water pollution sources, Waste water treatment, Water treatment, Separation techniques.

Performance tests were conducted on a reverse osmosis water purification unit with two types of membranes for treating polluted fresh water, sea water, brackish water, and water contaminated with chemical, biological, and radiological agents. The model unit was a 600 gal/hr Reverse Osmosis Water Purification Unit for producing potable water. The membranes compared were a dry, modified, brackish-water type cellulose acetate membrane and a sea water type polyamide membrane. The chemical agents were GB, VX, and BZ while the radiological agents were iodine-131, strontium-85, and cesium-134. The polyamide membrane was found to be superior to the cellulose acetate membrane, although both were effective in the removal of turbidity, conductivity, color, alkalinity, hardness, and dissolved solids from raw water. The polyamide membrane removed more than 99% of the chemical contaminants and removed 95.5% of the iodine-131, 99.7% of the strontium-85, and 98.8% of the cesium-134, on the average. The polyamide membrane was not, however, able to consistently reduce the levels of the chemical and radiological contaminants in the water to within the maximum permissible concentration (MPC). A post, activated carbon column to treat the permeate from the reverse osmosis unit and further research of the treatment process were recommended. (Lisk-FIRL)

FINAL EIS GREENSBORO-GUILFORD COUNTY, N.C. 201 WASTEWATER TREATMENT SYSTEM PROJECT NO. C37037601.
Environmental Protection Agency, Atlanta, GA. Region IV.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 694, Price codes: A19 in paper copy, A01 in microfiche. Report EPA 904/0-77-037. 1977. 445 p, 8 fig, 7 tab, append.

Descriptors: Waste wate treatment, Sewage treatment, *North Carolina, *Streams, *Environmental effects, Terrestrial habitats, *Tertiary treatment, Sewers, Air pollution effects, Odor, *Environmental Impact Statement.

This environmental impact statement was prepared in response to the awarding of a grant to the city of Greenboro, NC, for the purpose of developing a waste water treatment system to service about 36 mgd of waste water for the Greensboro-Guilford County area. The proposed action consisted of upgrading an existing plant to teriary treatment at 6 mgd, abandoning one plant, and building a new 0 mgd plant with tertiary treatment. Direct adverse environmental impacts were minor. They included sewer construction and plant construction causing short-term stream siltation and increased airborne particulate, destruction of some natural vegetation, temporary noise levels that exceed acceptable thresholds, and reduced flow in a segment of Buffalo Creek. Potential secondary adverse impacts include possible flooding and erosion, continued terrestrial habitat attrition, and increased air pollution due to population increases. Beneficial impacts include meeting the effluent limits for the creeks, elimination of an odor source, and allowance for planning orderly urban growth while minimizing urban sprawl. Seven alternatives are presented. (Small-FIRL)
W79-06345

DRAFT ENVIRONMENTAL IMPACT STATEMENT. HENDERSON, NORTH CAROLINA, 201 WASTEWATER TREATMENT SYSTEM.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 095, Price codes: A14 in paper copy, A01 in microfiche. 1976. 181 p, 48 fig, 41 tab, 70 ref.

Descriptors: *Waste water treatment, *Municipal wastes, Odors, Phosphorus, *Environmental effects, Water quality, Bodies of water, North Carolina, *Water pollution sources, *Environmental Impact Statement.

Three alternative waste water treatment systems to service the Greater Henderson area were developed. The major environmental impacts associated with the water quality downstream of the waste water treatment plant discharges are described. Using Alternative A, the Red Bud Creek treatment plant would be abandoned, the existing Nutbush Creek plant would be upgraded to a capacity of 1.58 mgd with odor controls and phosphorus removal, and a 2.12 mgd plant would be constructed on Sandy Creek. Alternative A would cause moderate adverse impacts on Sandy Creek, a substantial improvement in Nutbush Creek water quality, and a moderate increase in Kerr Reservoir water quality. Using Alternative B, the Red Bud Creek plant would be abandoned and a new 3.7 mgd plant would be constructed on Sandy Creek. This alternative would cause major improvement in Nutbush Creek water quality and a moderate adverse impact on Sandy Creek. Using Alternative C, The Red Bud Creek plant would be abandoned and the Nutbush Creek plant would be upgraded or expanded to 3.7 mgd with phosphorus removal and odor controls. This alternative would cause a substantial increase in the water quality of Nutbush Creek and Kerr Reservoir. (Small-FIRL)

MANAGEMENT OF METAL-FINISHING SLUDGE,
E. P. Crumpler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-263 946, Price codes: A04 in paper copy, A01 in microfiche. Report EPA/530/SW-561 1977. 62 p, 8 fig, 2 tab, 31 ref.

Descriptors: *Sludge treatment, *Sludge disposal, *Recycling, Chemical precipitation, Metallurgy, *Industrial wastes, Reverse osmosis, Ion exchange, Solvent extractions, Electrodialysis.

The state-of-the-art technology for the management of metal-finishing sludge is discussed. Disposal techniques, recycle and waste reduction technology are reviewed. The major advantages and disadvantages of each technique are presented, along with current EPA research and demonstration efforts. Environmentally adequate disposal technology includes encapsulation, heat treatment, chemical lining of disposal cells, and chemical fixation. Water treatment processes which produce nonhydroxide sludge include sulfide precipitation and starch xanthate precipitation. Internal recycle of rinse water dragout includes evaporative recovery, reverse osmosis, ion exchange, electrodialysis, freeze separation, solvent rinsing, and ion floatation. External recovery of segregated metals from sludges and solutions includes integrated treatment, Kastone treatment process, single metal sludge recovery, and spent bath recovery. Recovery of metals from mixed hydroxide sludges includes solvent extraction and electrochemical roasting. (Small-FIRL)

IN SITU TREATMENT OF HAZARDOUS MATERIAL SPILLS IN FLOWING STREAMS,
Battelle-Northwest, Richland, WA.
G. W. Dawson, B. W. Mercer, and R. C. Parkhurst.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 455, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-164. October 1977. 49 p, 16 fig, 8 tab, 9 ref.

Descriptors: *Activated carbon, *Chemical wastes, *Adsorption, *Running waters, *Application methods, Granules, Porous media, Treatment, Waste water treatment, Water pollution, Disasters, Water treatment, Separation techniques.

Buoyant activated carbon and porous fiber bags packed with granular activated carbon were compared for treating, in situ, chemical wastes from spills in flowing streams. Tests were conducted in a renovated irrigation ditch carrying water at flow rates between 3.98-4.45 cu ft/sec spiked with 4 lb methylisobutyl ketone (hexone), 1 lb of methanol, and 0.1 lb of rhodamine dye to simulate hazardous chemical wastes. Buoyant activated carbon was added by sub-surface and surface introduction to the waste flow and subsequently recovered by conventional skimming techniques. The non-buoyant packaged carbon bags were attached to floats and allowed to flow with the spill plume for a distance before manual removal. Flow rates of the waste water were varied in the irrigation channel which had a quiescent section. Buoyant carbon was superior to the carbon-filled bags, achieving 50% waste removal at carbon to contaminant ratios of 10:1; carbon recovery exceeded 90%. Containment removal by the porous bags was directly related to turbulence and current structure in the receiving water body, achieving 20% removal at a flow rate of 15 cu ft/sec. Up to 25% of the bags were lost due to snagging and shore capture. The bags were considered easier to handle and steam stripping was suitable for regenerating the hexone. An air deliverable slurry injection system was recommended for introduction of buoyant carbon and further investigations of the treatment methods were recommended. (Lisk-FIRL)

INDUSTRIAL WASTEWATER RECIRCULATION SYSTEM: PRELIMINARY ENGINEERING,
Owens-Corning Fiberglas Corp., Toledo, OH.
A. W. Loven, and J. L. Pintenich.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 990, Price codes: A09 in paper copy, A01 in microfiche. Report EPA-600/2-77-043, 1977. 150 p, 61 fig, 33 tab.

Descriptors: *Industrial wastes, *Recycling, *Waste water treatment, Filtration, *Performance, Activated carbon, Disinfection, Reverse osmosis, *Pilot plants.

Various technologies for a closed-loop, industrial waste water system were tested on a pilot plant scale at a fibrous glass plant. Sand filtration, activated carbon adsorption, and disinfection methods were tested and found to yield water suitable for reuse. If removal of inorganic dissolved solids is required, it can be accomplished through treatment by reverse osmosis or lime-soda softening/anion exchange. Complete physical and chemical treatment of fibrous glass plant wastes is not feasible due to extreme residual concentrations of nonadsorbable organic compounds. Construction of a full-scale plant is planned. The projected design loadings for advanced waste water treatment processes are: Flow = 285 gpm; TSS loading = 31 lb/day; and TOC loading = 116 lb/day. FEASIBILITY STUDY ON IN-SEWER TREATMENT METHODS,
Pomeroy, Johnston and Bailey, Pasadena, CA.
R. D. Pomeroy, and R. J. Lofy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 445, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-77-192 1977. 106 p, 16 fig, 10 tab, 22 ref, 2 append.

Descriptors: *Waste water treatment, *Sewers, Biochemical oxygen demand, *Oxygen, Activated sludge, Flocculation, Flow, Slopes, Sewage treatment.

Biological, chemical, and physical methods of in-sewer waste water treatment are discussed. Promise is seen in biological oxidation which leads to a partial reduction of BOD. An appreciable reduction of BOD occurs normally in sewers. Equations are developed which can estimate this oxidation. A high degree of treatment requires an adequate oxygen supply, and oxidizing culture, and time. The culture could be suspended in the form of activated sludge or attached to solid surfaces. Possible methods for supplying oxygen are discussed. The prospects for a useful degree of in-sewer treatment are good for force mains. Under certain limited conditions, a sewer can function as an efficient flocculation device in conjunction with chemical treatment. Slope-flow relationships in most sewers produce velocity gradients suitable for flocculation of aluminum hydroxide and iron hydroxide. (Small-FIRL)
W79-06350

APPRAISAL OF POWDERED ACTIVATED CARBON PROCESSES FOR MUNICIPAL WASTEWATER TREATMENT,
Battelle-Northwest, Richland, WA.
A. J. Shuckrow, and G. J. Culp.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 933, Price codes: A16 in paper copy, A01 in microfiche. Report EPA-600/2-77-156, 1977. 340 p, 27 fig, 137 tab, 44 ref, 1 append.

Descriptors: *Activated carbon, *Sewage treatment, Activated sludge, Nitrification, *Evaluation, *Costs, Performance, *Granules, Municipal wastes.

All work with powdered activated carbon (PAC) and PAC regeneration was reviewed, and representative processes were compared with activated sludge, activated sludge with nitrification, and granular activated carbon. No one PAC approach was superior from a performance point of view. Biophysical processes were attractive because they can be incorporated into existing biological plants. Capital and operating costs were compared for plants with throughput rates of 1, 5, 10, 25, and 50 mgd. Independent physical-chemical PAC systems were not economically competitive with other modes of treatment. PAC can offer advantages for specific cases where highly variant flows are experienced such as plant receiving flows of a seasonal nature or areas with combined storm sewer systems. Possible improvements which could make PAC competitive were investigated. Lower carbon doses and/or inexpensive throwaway carbon are necessary to make the system competitive with the other systems evaluated. (Small-FIRL)
W79-06352

CONTROL OF REFINERY VACUUM PRODUCING SYSTEMS, WASTEWATER SEPARATORS AND PROCESS UNIT TURNAROUNDS,
Environmental Protection Agency, Research Triangle Park, NC. Office of Air Quality Planning and Standards.
K. C. Hustvedt, and R. A. Quaney.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-275 662, Price codes: A03 in paper copy, A01 in microfiche. Report EPA-450/2-77-025, October 1977. 40 p, 4 fig, 5 tab, 40 ref.

Descriptors: *Air pollution, *Oil industry, *Organic compounds, *Oil wastes, *Separation techniques, Oily water, Maintenance, Economics, Gases, Vapor pressure, Volatility.

The technology, impacts, regulations, and economics of controlling volatile organic compound (VOC) emissions from vacuum producing systems, waste water separators, and process unit turnabouts in petroleum refineries are discussed. VOC emissions from vacuum producing systems may be controlled by passing non-condensable vapors to a fire-box, incinerator, or to a compressing system. Waste water separator emissions may be minimized by covering forebays and separator sections; types of covers suitable for these areas are described. Process unit turnabouts, such as shutdowns, repairs, inspections, and start ups, may incorporate systems where vapors are added to the fuel gas system, flared, or vented to the atmosphere; VOC emissions will be minimized if vapors are combusted with fuel gas or flared until the pressure in the vessel is close to atmospheric pressure. An economic analysis of control systems considers all the technical parameters used in developing control costs. The impacts of these emission control technologies on energy and the environmental are discussed briefly. Regulatory aspects reviewed include the identification of plants to which regulations would apply, the selection of an appropriate format, and recommendations for compliance and monitoring techniques. AUTOMATIC EXCHANGE RESIN PILOT PLANT FOR REMOVAL OF TEXTILE DYE WASTES,
Bennett Coll., Greensboro, NC.
A. Maggiolo, and J. H. Sayles.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 362, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-136. 1977. 54 p, 18 fig, 5 tab, 7 ref, 1 append.

Descriptors: *Resins, *Adsorption, Waste water treatment, *Dyes, *Industrial wastes, *Cost comparisons, Automation, Capital costs, Recycling, Solubility, Laboratory tests.

Adsorption resins were used to remove colored dyes from textile dyeing waste waters using an automated bench-scale pilot unit. This method could make possible the reuse of treated waste waters in subsequent dyeing operations at competitive costs. At a waste water treatment rate of 20,000 gpd by resin adsorption, the amortized operating cost was estimated at $3.47/1000 gal. Capital investment was estimated at $86,000. Operating costs for alternative processes, ozonation, carbon treatment, and hyperfiltration (reverse osmosis) are $1.90, $1.00, and $2.00/1000 gal, respectively, on a one million gpd rate of operation. These costs would equal or exceed the estimated costs for the resin adsorption process when scaled down to the typical 20,000 gpd dispersed dye hosiery plant basis. Adsorption resins have the advantage of removing insoluble dispersed dyes from waste water. The three alternative processes effectively remove soluble dyes, but not much is known about their effectiveness in removing insoluble dyes. Insoluble dyes are non-responsive to biological waste treatment. (Small-FIRL)

EVALUATION OF OZONATION AND CHLORINATION FOR DISINFECTION OF BLACKWATER,
Abcor, Inc., Wilmington, MA. Walden Div.
K. J. McNulty, and R. L. Goldsmith.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A033 734, Price codes: A05 in paper copy, A01 in microfiche. Final Report December 1976. 89 p, 43 fig, 6 tab, 13 ref.

Descriptors: *Chlorination, *Ozone, *Disinfection, *Ships, *Waste water, Hydrogen ion concentration, Temperature, Coliforms, Operating costs, Capital costs.

Disinfection tests on marine vessel blackwater compared ozonation and chlorination at various concentrations, temperatures, and pH's for reducing fecal coliform levels to 200 colonies/100 ml. Experiments focused on ozone or chlorine dosages required at temperatures of 15C and 30C and pH ranging from 5-9. Ozonation was unaffected by temperature and pH while the required chlorine dosage appeared to increase with temperature and pH (at 30C). The variation in blackwater samples was cited as a possible reason for the increase in chlorine requirements. Results of the disinfection study indicated that an ozone dosage of 750 mg/liter was required to attain the desired fecal coliform level while a chlorine concentration of 240 mg/liter was necessary. An economic analysis of the two treatment methods determined that operating and capital costs for the ozonation system were three times greater than the costs for a chlorination system. Ozonation, however, was considered to have the advantages of better viricide action and no production of chlorinated hydrocarbons. (Lisk-FIRL)

ENZYME TECHNOLOGY FOR SHIPBOARD WASTE MANAGEMENT,
David W. Taylor Naval Ship Research and Development Center, Annapolis, MD.
L. R. Harris, and A. E. Lardis.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A033 730, Price codes: A03 in paper copy, A01 in microfiche. Technical Report 76-0117, 1976. 28 p, 5 tab, 38 ref.

Descriptors: *Enzymes, *Ships, Oil pollution, *Oily water, *Waste water treatment, Water pollution sources, Odor cleaning.

Current enzyme technology and applications were reviewed, and areas were identified where enzymes may provide solutions to shipboard waste management problems. Enzyme characteristics were discussed including enzyme kinetics, reactors, and immobilization, and current applications are reviewed. Waste water treatment methods being considered by the Navy include utilization of a packed bed immobilized enzyme system, an enzyme cellulase process, enhancement of UF performance using enzymes, and detoxifying organotin compounds. Enzymes systems are also being considered for odor control, cleaning operations, oil pollution control and analytical monitoring. Research and development recommendations are made including development of a shipboard waste water treatment system based on immobilized enzyme technology, and determination of the feasibility of adding enzyme/bacterial products for controlling oil discharges from ballast tanks. HIGHLIGHTS OF RESEARCH ON OVERLAND FLOW FOR ADVANCED TREATMENT OF WASTEWATER,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Environmental Effects Lab.
C. R. Lee, P. G. Hunt, R. E. Hoeppel, C. A. Carlson, and T. B. Delaney.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A033 864, Price codes: A03 in paper copy, A01 in microfiche. Technical Report Y-76-6, 1976. 24 p, 9 fig, 4 tab, 17 ref.

Descriptors: Tertiary treatment, *Municipal wastes, Waste water treatment, *Overland flow, Slopes, *Heavy metals, *Nitrogen, *Phosphorus, Performance.

Greenhouse grass-soil models were used to study the overland flow treatment of municipal waste water. The response of overland flow treatment of nitrogen, phosphorus, and heavy metals to various operating conditions was determined. Overland flow was an efficient nitrogen removal method. Up to 99% nitrogen removal was obtained at a 2% slope with an application period of either 6 or 18 hr. Phosphorus removal was about 80 to 84% when 0.5 inch/acre of waste water was applied to a 2% slope in either 6 or 18 hr. Waste water flowing over the soil does not have extensive contact with iron and aluminum compounds in the soil that fix massive amounts of phosphorus. Heavy metal removal was greater than 90% when 0.5/inch/acre of waste water was applied in 6 hr on a 2% slope. Overland flow systems require extensive construction, a suitable cover crop, waste water storage during cold weather, and a flow rate no greater than 0.5 inch/acre/day. (Small-FIRL)

M. Botros, and W. C. Best.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A039 603, Price codes: A04 in paper copy, A01 in microfiche. Report FESA-RT-2017, 1976. 49 p, 13 fig, 5 tab, 3 ref.

Descriptors: Laundering, *Domestic wastes, Waste water treatment, *Recycling, *Coagulation, *Flocculation, Sulfates, *Filtration, Filters, Cost analysis.

A laboratory investigation was conducted of the chemical treatment of laundry waste water using different coagulation and flocculation compounds. When ferric chloride was used, sodium hydroxide and WT-2700 (1 flocculation aid) were used which increased costs and required a complicated treatment design. When aluminum sulfate and lime were used, water hardness increased. The use of Al2(SO4)3 alone gave good results, and the use of Al3(SO4)3 with polyelectrolyte WT-2700 gave excellent results. Good flocculation was obtained in a pH range of 5.5-6.5 and a temperature range of 25-35C with flow turbidity. Filtration was also discussed including the design of the ideal sand filter, the use of polymers as a filtration aid, and types of filter structures. The recycling of laundry wastewater at army installations would not be cost effective. (Small-FIRL)

COUNTERCURRENT RINSING ON A HIGH-SPEED HALOGEN TINPLATING LINE,
National Steel Corp., Weirton, WV. Weirton Steel Div.
D. A. Pengidore.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 590, Price codes: A05 in paper copy, A01 in microfiche. Report EPA-600/2-77-191, 1977. 94 p, 19 fig, 4 tab, 6 ref, 1 append.

Descriptors: *Waste water treatment, *Industrial wastes, *Recycling, *Metallurgy, Chemicals, Steel, Metals.

The first use of countercurrent rinsing on a high speed plating line was investigated. The operating performance of the multistage rinse system was studied to determine whether or not the basic principles of countercurrent rinsing would hold. Also, the best method for recovering the chemicals in the concentrated stream from this rinse system were determined. Also described are efforts to recycle the concentrated rinse back into the main plating system. The problems encountered in the direct recycle may be solved by a new technique in removing sodium ions from the rinse stream or the main bath. Plans are underway to recover the tin values from the dragout recovery system by sending the rinse solution to the Detinning Plant. Full recovery of fluorides and other constituents at the Detinning Plant is also under investigation. (Small-FIRL)

REPORT ON THE PLANT EVALUATION AT OLD FAITHFUL WASTEWATER TREATMENT PLANT YELLOWSTONE NATIONAL PARK,
Environmental Protection Agency, Denver, CO. Region VIII.
O. K. Boe, and L. Malloy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 743, Price codes: A02 in paper copy, A01 in microfiche. Report EPA-908/3-77-004, 1977. 10 p, 2 fig, 1 tab.

Descriptors: *Activated sludge, Aeration, Sewage, *Waste water treatment, *Nitrification, *Temperature, Settling basins, Nitrogen.

Observations and process control data obtained at the Old Faithful 0.51 mpg activated sludge waste water treatment plant were assessed by the EPA. The high temperature of the waste water was a critical factor which influenced all phases of operation. Warm sewage seemed to cause nitrification in the plant even though the facility was not designed to nitrify. Settleometer tests indicated the formation of extensive gas bubbles, probably nitrogen, which caused excessive floating of sludge in both the settlometer and the clarifier. Recommendations are made to reduce the degree of nitrification. A carefully controlled sludge wasting program should be established during start up, and the system may need to operate at less than design hydraulic detention times. The final clarifier should operate to minimize sludge detention times. One or more of the reaeration basins may be used as an N2 stripping basin. Process control tests and data analyses should be continued to further process control analyses. (Small-FIRL)

INVESTIGATION OF THE FEASIBILITY OF TERTIARY TREATMENT OF MUNICIPAL WASTEWATER STABILIZATION POND EFFLUENT USING RIVER WETLANDS IN MICHIGAN,
Williams and Works, Grand Rapids, MI.
J. C. Sutherland.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-275 283, Price codes: A08 in paper copy, A01 in microfiche. Report, 1977. 164 p, 11 fig, 1 tab, 5 append.

Descriptors: Feasibility, *Wetlands, *Tertiary treatment, *Municipal wastes, Waste water treatment, Capital costs, *Michigan, Rivers, Energy, *Streams.

The engineering feasibility of using Michigan river wetlands for tertiary treatment of municipal waste water stabilization pond effluent was investigated as an alternative to upland spray irrigation and chemical tertiary treatment. An aerial reconnaissance was made of 75 Michigan Southern Peninsula rural municipalities with populations ranging from 360-2800 which utilized treatment ponds and had proximal streams. Thirty-five to 40% of these were estimated to have suitable wetlands. The method could yield capital cost savings totalling about $320,000 (1977 dollars) when used instead of upland irrigation, and about $150,000 when used instead of chemical treatment. Interaction with the Wisconsin Department of Natural Resources indicated interest in the wetlands treatment method for municipal application. The wetland method is esti-

mated to be the most cost effective when pond-wetland distance is less than four miles. Favorable capital cost advantages include anticipated low land cost and minimum of on-site hardware. Also, operational energy requirements would be low. (Small-FIRL)
W79-06383

THE FEASIBILITY OF ESTABLISHING OPERATIONAL WATER HYACINTH-BASED SYSTEMS AT THE TREATMENT FACILITIES OF EXISTING CITIES,
Caspan Corp., Houston, TX.
F. C. Urteaga.
Available from the National Technical Information Service, Springfield, VA 22161 as N78-14947, Price codes: A04 in paper copy, A01 in microfiche. Final Report, 1977. 51 p, 12 tab, 4 ref.

Descriptors: *Municipal wastes, Groundwater, *Sewage lagoons, *Water hyacinth, Waste water treatment, Florida, Texas, Costs, Regulation, *Feasibility, Cities.

The feasibility of establishing operational water hyacinth treatment facilities at three South Florida and two South Texas communities of 20,000 residents or less, was investigated. Florida cities were not responsive and were generally unsuited to the suggested treatment system. The Florida Department of Environmental Regulation discourages the use of stabilization ponds and surface discharge. This is because of South Florida's very high groundwater table and the fact that treatment facilities had already reached advanced planning stages. South Texas communities, on the other hand, were excellent candidates for water hyacinth treatment because of current treatment systems, regulatory philosophy, stage of planning to meet permit requirements, and economic conditions. Stabilization ponds which could be converted, are common. Up-grading current facilities would, however, require financial assistance. (Small-FIRL)

VIRAL AND BACTERIAL AEROSOLS AT A WASTEWATER SPRAY IRRIGATION SITE,
Army Medical Bioengineering Research and Development Lab., Fort Detrick, MD.
H. T. Bausum, S. A. Schaub, and K. F. Kenyon.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-054 436, Price codes: A03 in paper copy, A01 in microfiche. Technical Report 7804, 1976. 37 p, 2 fig, 14 tab, 14 ref.

Descriptors: *On-site tests, *Spraying, *Aerosols, Waste water, Microorganisms, *Aerobic bacteria, Fluorescent dye, *Tracers, Model studies, Viruses.

The second phase of a field study to measure microbiological aerosol dissemination by the spray irrigation mode of land waste water application was conducted at Ft. Huachuca, AZ. Bacterial and virus aerosols were sampled after spraying chlorinated and unchlorinated secondarily treated waste waters during periods of high and low sunlight intensity. Predictions were attempted of long distance migration and aerosol dispersal of total aerobic bacteria and enteric virus using seeded coliphage f2 as a model. In some runs, the waste water was seeded with sodium fluorescein dye to estimate physical aerosol decay. In chlorinated effluent, aerobic bacteria averaged 240,000 cfu/mg (standard plate count). One hundred and fifty m downwind of the sprayer, bacterial aerosol levels were as high as 9900/cu m at 46 m. Downwind levels were inhanced by darkness or low solar radiation. Chlorination at about 6 mg/liter reduced waste water effluent bacterial levels 3300-fold, and reduced bacterial aerosols to near background levels at all distances. Fluorescein dye aerosol levels remained somewhat higher in relation to source strength than bacterial levels, providing an indication of the extent of early bacterial die-off. Source strength and meteorological date were used in conjunction with a dispersion model to generate mathematical predictions of aerosol strength at each sampler location. Ratios of predicted aerosol strength to observed strength ranged from 308 to 1661. (Small-FIRL)

EVALUATION OF MEMBRANE SEPARATION PROCESSES, CARBON ADSORPTION, AND OZONATION FOR TREATMENT OF MUST HOSPITAL WASTES,
Abcor, Inc., Wilmington, MA. Walden Div.
A. Z. Gollan, K. J. McNulty, R. L. Goldsmith, M. H. Kleper, and D. C. Grant.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A030 057, Price codes: A20 in paper copy, A01 in microfiche. Final Report, 1976. 437 p, 80 fig, 53 tab, 33 ref, 11 append.

Descriptors: Waste water treatment, *Reverse osmosis, *Adsorption, *Ozone, Membranes, *Filtration, *Hospitals, Organic matter.

The development of a compact 4000 gpd waste system to process non-sanitary wastes at a MUST army field hospital was investigated. Processes evaluated included waste equalization, ultrafiltration (UF), reverse osmosis (RO), and post treatment. A treatment sequence of waste equalization, UF, RO, O3, ion exchange, and Cl2 produced an effluent suitable for reuse. This treatment sequence also produced satisfactory discharge effluent for laundry composite wastes but not for laboratory wastes. This treatment sequence also produced potable water from brackish surface waters. A process design was developed for a system capable of operating in either the reuse mode or the waste-treatment/water-treatment mode. The system satisfies all quality specifications except for laboratory wastes. When operating on laboratory wastes, the system will have a reduced output capacity because of the organic content of the laboratory waste RO permeate exceeds the treatment capabilities of the ozonation system. ECONOMIC ASSESSMENT OF FGD SLUDGE DISPOSAL ALTERNATIVES,
Tennessee Valley Authority, Muscle Shoals, AL.
J. W. Barrier, H. L. Faucett, and L. J. Henson.
Journal of the Environmental Division, American Society of Civil Engineers, Vol 104, No 5, p 951-966, October 1978. 13 tab, 25 ref.

Descriptors: *Sludge disposal, *Flue gas desulfurization, *Electric powerplants, *Waste disposal, *Alternative costs, Alternative planning, Slurries, Lime, Landfills, Ponds, Tennessee Valley Authority, Sulfur dioxide, Fly ash, Scrubbers, Economics, Costs, Coals, Chemfix process, IUCS process, Dravo process, Untreated ponding, Untreated sludge-fly blending, Gypsum.

Evaluation of six disposal processes for flue gas desulfurization (FGD) sludge indicated that in all case variations the gypsum option required the lowest capital investment and annual revenue requirement. The six alternatives were: (1) untreated ponding, (2) Dravo process, (3) IU Conversion Systems process, (4) Chemfix process, (5) untreated sludge-fly ash blending, and (6) gypsum. FGD systems are being installed in coal-fired steam-generator electric power plants to meet federal emission standards, to remove sulfur dioxide before flue gas is discharged in the atmosphere. Some 90% of systems employ scrubbing with lime or limestone slurry, resulting in reaction products requiring disposal. This report is based on option assessments made by the Tennessee Valley Authority. Conclusions: (1) gypsum requires a much smaller equipment investment than other options except untreated ponding, which requires a very expensive disposal pond; (2) altenatives involving pond disposal (untreated and Dravo) require th highest capital investments (all other processes i volve landfill disposal); (3) processes using chem cal treatment (Dravo, IUCS, and Chemfix) ha higher annual revenue requirements than the othe three; (4) both unit capital investment and un revenue requirements were slightly lower for larg plant sizes; and (5) capital and revenue require ments vary almost directly in proportion to quant fy of sludge. Other factors included remainin plant life, distance to disposal site, and type c transport. (Lynch-Wisconsin)

LAND MANAGEMENT OF SUBSURFACE-IN JECTED WASTEWATER LIQUID RESIDUALS
Colorado State Univ., Fort Collins. Dept. of Agri cultural and Chemical Engineering.
J. L. Smith, M. H. Lutkin, J. S. Latham, and A. de Haai.
Available from the National Technical Informatio Service, Springfield, VA 22161 as PB-280 162 Price codes: A03 in paper copy, A01 in microfiche Interim Report, 1977. 44 p, 6 fig, 3 tab, 8 ref, append.

Descriptors: *Pilot plant, *Ultimate disposal, *Irra diation, Kansas, *Disinfection, Sewage treatment *Waste water treatment, Costs, Injection wells Landfills.

Recommendations are made for the construction and operation of a Proof-of-Concept Experimen facility adjacent to the sewage treatment plant a Lawrence, Kansas. The objectives of the POCF were: to determine the acceptability of irradiation disinfection and subsurface injection as an alterna tive technology for current methods of stabiliza tion and handling waste water residuals; and, to define specific operational characteristics and eco nomics of irradiation disinfection and subsurface injection as a technology for the treatment o waste water residuals. The optimum configuration of treatment facilities utilizing irradiation disinfec tion and subsurface injection was to be determined Also, the environmental effects of subsurface injec tion of irradiation disinfected residuals, were to be investigated. Potential benefits of this research are reduced treatment costs, simplification of treat ment facilities, and preparation of a better and safer product for land application. (Small-FIRL)

FEASIBILITY STUDY OF VACUUM FILTRATION SYSTEMS FOR DEWATERING DREDGED MATERIAL,
Ryckman, Edgerley, Tomlinson, and Associates, Inc., St. Louis, MO.
B. W. Long, and D. J. Grana.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A053 773, Price codes: A09 in paper copy, A01 in microfiche. Technical Report, 1978. 169 p, 57 fig, 9 tab, 8 ref, 2 append.

Descriptors: *Filtration, *Dredging, *Dewatering, *Waste disposal, Particle size, Coagulation, Separation techniques, Lime, *Performance.

The feasibility of dewatering dredged material by vacuum filtration was investigated. Samples from six disposal areas were characterized: Penns Neck Spillway, Apalachicola Bay, Mobile Bay, Toledo Harbor, Craney Island, and Browns Lake. Particle size distributions, specific resistance to filtration, filter leaf studies, and bench-scale vacuum filtration studies were conducted. Seven chemical coagulants were investigated with each sample. Dredged material was effectively dewatered to 45 to 60% solids (depending on site) using lime dosages of 7 to 10% of the solids in the sample. Filter yields of up to 9.0 lb solids/sq ft/hr were observed. Generally, the quality of the filtrate was in the range of 500 to 1500 mg/liter suspended solids. Pilot plant studies are recommended to further evaluate the operating parameters of vacuum filtration. (Small-FIRL)

DEMILITARIZATION OF CS I. CHEMICAL DISPOSAL OF CS BY HYDROLYSIS,
Edgewood Arsenal, Aberdeen Proving Ground, MD.
M. E. Brooks, P. M. Davis, and S. Sass.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A033 469, Price codes: A02 in paper copy, A01 in microfiche. Technical Report, 1976. 19 p, 3 tab, 4 ref.

Descriptors: *Ultimate disposal, *Water pollution sources, *Hydrolysis, *Chemical warfare, Waste treatment.

Studies of the chemical disposal of CS (tear gas or orthochlorobenzamalonitrile) by conversion to a salable product, were performed. Alkaline hydrolysis of CS was selected as the simplest means of converting CS to a salable product, O-chlorobenzaldehyde. Initially isopropyl alcohol was used as a solvent, but when that failed to yield the desired salable end product, a slurry of 16.6 w/v% CS in 6.6% aqueous NaOH (2 moles of NaOH per mole of CS) was used. The O-chlorobenzaldahyde can be recovered from the water phase by extraction with benzene or methylene chloride. For plant scale demilitarization of CS, the following parameters are recommended: NaOH:CS ratio = 1.1:1, NaOH concentration = 6% or 12%, reaction temperature is 35 to 50C, reaction time = 10 min, product separation occurs as a second liquid phase, and product purification is by water wash at ambient temperatures. LAND TREATMENT OF WASTEWATER AT WEST DOVER, VERMONT,
Army Terrestrial Sciences Center, Hanover, NH.
J. R. Bouzoun.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A046 300, Price codes: A03 in paper copy, A01 in microfiche. Special Report 77-33 October 1977. 31 p, 7 fig, 9 tab, 12 ref, 5 append.

Descriptors: *Spray irrigation, *Return flow, *Sewage treatment, *Flow rates, *Seasonal, Cold regions, Infiltration, Runoff, Monitoring, Test wells, Waste water treatment, Waste water disposal, Municipal wastes, Treatment facilities, Spraying.

Secondary effluent has been sprayed on a forested knoll in West Dover, Vermont, for two years as part of the land application waste water treatment operation. The rate of application was designed for a winter flow of 0.55 mgd; winter volumes are higher than other seasons due to an influx of winter vacationers. The spraying of effluent has been conducted at ambient temperatures down to 10F. Freezing problems in the spray nozzles and laterals have been corrected; all upward spraying nozzles are spaced 50 ft apart in summer and 25 ft apart in winter. Summer-Fall design flow rates average 0.30 mgd while Spring design flow rate average 0.11 mgd. Effluent samples, groundwater wells, diversion ditch flows, and nearby streams are being monitored to evaluate the treatment process. Further investigations are examining the possibility of producing snow from the secondary effluent to insulate the soil against freezing and thus insure infiltration of the water into the soil throughout the winter and reduce runoff during spring melt. SOLID WASTE DISPOSAL BY LANDSPREADING TECHNIQUES,
Civil Engineering Lab. (Navy), Port Hueneme, CA.
E. R. Durlak.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-B017 149, Price codes: A04 in paper copy, A01 in microfiche. Technical Note N-1471, 1977. 74 p, 31 fig, 14 tab, 29 ref, 3 append.

Descriptors: *Solid waste, *Ultimate disposal, Sludge disposal, *Application methods, *Aerobic treatment, Vegetation, *Soil disposal fields, Soils, Waste treatment, Waste disposal.

The landspreading technique for solid waste disposal is described and discussed. Landspreading is the disposal of solid waste by mixing compostable materials into the topsoil so that the decomposition process remains aerobic. Landspreading advantages include minimum settling of the land, no undesirable odors or leachates, a potential for the support of vegetation, continued usefulness of the land, restoration in a minimum amount of time, and improvement in soil texture and water retention. Three types of construction rototillers and two types of soil were examined in a study of the homogenization of solid waste into the top soil to depths up to 20 inches. Rototillers adequately mixed 10 to 12 inches of soil with solid waste piled about 12 inches deep on the ground. The mixture in the test plots was both homogeneous and uniform to about 16 inches. Some plant growth resulted. (Small-FIRL)

PHOTOGRAPHIC WASTE UTILIZATION,
Horizons, Inc., Cleveland, OH.
S. S. Donovan.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A033 065, Price codes: A02 in paper copy, A01 in microfiche. Technical Report AFAL-TR-76-162. 1976. 51 p, 14 fig, 23 tab, 26 ref.

Descriptors: *Waste water disposal, *Landfills, Sanitary engineering, *Photography, *Recycling, Ultimate disposal, Pollution abatement, *Chemical wastes.

The pollution hazards associated with the disposal of 10 tons/wk of photographic processing wastes were eliminated by incorporating photowaste into a ceramic foam, a ceramic castable, and to modify it to an untramarine pigment. The ceramic foam could be used as an insulating firebrick and the ceramic castable could be used as an insulating castable. Each green product contained 10 wt% of photowaste, and physical properties of the producta were identical or better than comparable commercial products. The foam cost about 23.6 cents/lb and the castable 25.5 cents/lb, to manufacture. Necessary capital equipment and a functional plant layout, are given. A portable unit for on-site foam fabrication under a wide range of climatic conditions is also described. All three approaches were technically feasible, but pigment fabrication was economically unfeasible. Tests were also conducted to render the waste harmless and suitable for a class three landfill. Clay-containing foam cured at 1000F or non-clay-containing foam cured at room temperature were suitable for landfills that were not excessively alkaline. Castable cured at 1000F was suitable for alkaline landfills. (Small-FIRL)

LANDFILL DISPOSAL OF HAZARDOUS WASTES; A REVIEW OF LITERATURE AND KNOWN APPROACHES,
Environmental Protection Agency, Washington, DC. Office of Solid Waste.
T. Fields, and A. W. Lindsey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 079, Price codes: A03 in paper copy, A01 in microfiche. Report EPA/530/SW-165, 1975. 36 p, 1 fig, 4 tab, 32 ref, 1 append.

Descriptors: *Landfills, *Ultimate disposal, Injection wells, *Chemical wastes, Groundwater, *Hazards, Radioactivity, *Solid wastes, Incineration.

A review is presented of conventional sanitary landfilling, the chemical waste landfill, and alternatives to chemical waste landfill disposal. Research, development, and demonstration programs in hazardous waste land disposal are discussed. Hazardous wastes are categorized as toxic chemical, radioactive, flammable, explosive, or biological. Existing industrial waste landfills are described. Site design and preparation are considered including liners, pH adjustments, cover materials, and observation/monitoring wells. Various waste preparation methods are described including chemical fixation, volume reduction, waste segregation, detoxification, degradation, and encapsulation. Alternatives to chemical waste landfills such as incineration, deep well injection, ocean dumping, and detonation. (Small-FIRL)

MULTIMEDIUM MANAGEMENT OF MUNICIPAL SLUDGE.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 093, Price codes: A10 in paper copy, A01 in microfiche. Report 1977. 202 p, 7 fig, 23 tab, 187 ref, 1 append.

Descriptors: *Ultimate disposal, *Sludge disposal, *Municipal wastes, *Decision making, *Environmental effects, Waste water treatment, Metals, Toxicity, Costs, Performance.

Methods available for managing municipal waste water treatment residuals are reviewed. The disposal or reuse of sludge in three environmental media is considered: ocean, land, atmosphere. Sludge management options are compared in terms of their primary impacts, intermedium effects, risk of environmental damage, technical reliability, direct and indirect costs, and status in regard to present environmental regulation. These comparisons are used to outline a general approach to decision making in sludge management. The final stages of the waste water treatment system are emphasized, but the study also examines the potential for lowering the concentration of metals and other toxic materials in sludge through source control and pretreatment of industrial wastes. WATER TREATMENT: TASTE AND ODOR.
Ground Water Age, Vol 12, No 11, p 25, 26, 30, July, 1978.

Descriptors: *Water treatment, *Taste, *Odor, *Turbidity, *Palatability, Aesthetics, Organic matter, Dissolved gases, Dissolved minerals, Activated carbon, Filtration, Chlorination, Potable water.

Factors affecting palatability in drinking water include taste, odor and turbidity. Organic matter is the chief cause of bad taste and odor in water. Sources of organic matter are algae, industrial wastes, and decaying organic matter. They can be treated by filtration through a bed of activated charcoal or by hypochlorination. Dissolved gases are another major source of bad taste and odor in water. The most common gas, hydrogen sulfide, imparts a rotten egg smell to water and causes it to be highly corrosive. Hydrogen sulfide can be removed with either an activated charcoal filter or an oxidizing filter. Dissolved minerals cause a bad taste but do not affect odor. Iron and manganese create a sharp metallic taste and stain clothing, plumbing fixtures and food. Highly alkaline water may have a soda taste. Various neutralizing methods are available to lower the pH. Excess sulfate content is common in water in some areas of the country. A demineralizing filter should be used for drinking water with this problem. Turbidity is caused by small insoluble particles suspended in the water. Although they may be harmless, odorless and tasteless, they still are unsightly. Turbidity can be removed by mechanical filtration or coagulation. (Purdin-NWWA)

EVALUATION OF SORBENTS AS ORGANIC COMPOUND ACCUMULATORS,
Ames Lab., IA.
C. D. Chriswell, J. S. Fritz, and H. J. Svec.
Available from the National Technical Information Service, Springfield, VA 22161 as IS-M 123, Price codes: A04 in paper copy, A01 in microfiche. 1977. 9 p, 1 fig, 4 tab, 6 ref.

Descriptors: *Sorption, *Activated carbon, Water purification, *Resins, Organic matter, Properties, *Municipal water, Potable water, Water treatment.

Sorptive properties of fifteen activated carbons and synthetic resins were evaluated by comparing recovery of organic materials to results obtained with XAD-2 resin. The test sorbents included three polystyrene-divinylbenzene (PS-DV) macroreticular resins, two acrylic ester macroreticular resins, one phenol-formaldehyde absorbent, three week-base anion exchange resins, six activated carbons, and one carbonaceous resin. Four municipal water supplies were sampled using parallel sorption columns. The highest recoveries were obtained using the PS-DV macroreticular resins. Recoveries were lower from acrylic ester macroreticular resins than from PS-DV resins but were higher than from other sorbents. Recoveries from activated carbons were generally quite low. (Small-FIRL)

PROBLEM DEFINITION STUDY: PRODUCTION AND TESTING OF PYROGEN-FREE WATER UNDER FIELD CONDITIONS,
Army Medical Bioengineering Research and Development Lab., Fort Detrick, MD.
J. J. Barkley, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A049 033, Price codes: A03 in paper copy, A01 in microfiche. Technical Report 7612, November 1976, 30 p. 86 ref, 2 append.

Descriptors: *Pyrogens, *Water purification, *Pharmacy, *Limulus Amebocyte Lysate test, *Public health, *Endotoxins, *Methodology, *Water treatment, Pyrogen-free water, Activated carbon, Potable water, Medicine, Bioassay, MUST Pharmacy Modules, Chlorination, Bacteria, Gram-negative bacteria, Costs, Testing procedures, Fever, Microorganisms, Algae, Toxicity, Poisons, Ultraviolet radiation, Ozone, Sterilization, Military aspects.

The best water treatment system for pyrogen removal from potable water for pharmaceutical applications and subsequent testing of purified water under field conditions (particularly military) consists of ion-exchange, carbon absorption, UV irradiation, and ozonation; the Limulus Amebocyte Lysate test (LAL) is the preferable testing method. Pyrogens, derived from certain metabolic by-products of bacteria, molds, some yeasts, viruses, and algae, and from certain chemicals, cause fever when injected into mammals, though not when ingested. Chemical pyrogens are removed by standard water treatment practices, but progens pass through most bacterial filters. Biological pyrogens are often referred to as endotoxins; the most potent are derived from gram-negative bacteria. Distillation, the most widely used method of pyrogen removal, is the most costly: production of 100 gal pyrogen-free water in 16 hrs requires 18.2 kw electricity and 0.9 gal cooling water/min., while the recommended system would consume less than 0.5 gal/min cold water and no more than 3 kw. The rabbit test is the only test recognized by the US Pharmacopeia (USP), but in field uses, such as in the Pharmacy Module of MUST-equipped hospitals, disadvantages include the need to maintain test animals, three-hr duration, and requirement of skilled personnel. The LAL test is commercially available, rapid, simple, and specific, though it is pH; temperature; and agitation-dependent. This test uses the blood cell (amebocyte) of the horseshoe crab (Limulus polyphemus). (Lynch-Wisconsin)

ENVIRONMENTAL ASSESSMENT GUIDANCE MUNICIPAL SEWAGE TREATMENT WORKS PROGRAM.
Environmental Protection Agency, Chicago, IL. Water Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 150, Price codes: A05 in paper copy, A01 in microfiche. Report No EPA-905/2-77-004, October 1977. 89 p, 4 fig, 5 append.

Descriptors: *Treatment facilities, *Sewage treatment, *Planning, *Evaluation, Social aspects, Economic evaluation, Environmental effects, Cost analysis, Waste water treatment, Waste disposal.

A working document of a general nature intended to assist in the preparation of facility plans for construction of municipal sewage treatment works is presented. Environmental, social, and economic evaluation are viewed as an integral part of the facilities-planning process and should be performed throughout the process. A cost-effective analysis is defined as a systematic comparison of alternative ways of dealing with waste water treatment and disposal problems to identify the solution which will minimize total costs to society; these costs are monetary and environmental. Guidelines are presented for an inventory of the existing environment, the development of alternatives, and evaluating the environmental impact. (Davison-IPA)

MONOGRAPH ON CARBON: ACTIVATED CHARCOAL,
Informatics, Inc., Rockville, MD.
R. W. Rogers.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 129, Price codes: A03 in paper copy, A01 in microfiche. Report No. FDA/BF-78/90, October 18, 1977. 41 p, 3 fig, 10 tab, 141 ref. FDA 223-76-2001.

Descriptors: *Carbon, *Activated carbon, *Filtration, *Water purity, *Water purification, Absorption, Waste water treatment, Data collections, Physical properties, Water pollution treatment.

The available scientific literature from 1920 to 1977 on carbon (activated charcoal) is summarized. In addition to being used as an antidote to poison, activated charcoal has been used in sugar refining, brewing, and as a filter in the purification of many products such as gelatin, lard, oils, fats, sorghum syrup, fruit juices, and water for the soft drink industry. Chemical information, biological data, and the biochemical aspects of carbon are given. (Davison-IPA)
W79-06104

DEVELOPMENT AND TESTING OF BREADBOARD ELECTROCHEMICAL ORGANIC CONTENT ANALYZER,
Life Systems, Inc., Cleveland, OH.
R. J. Davenport, and R. A. Wynveen.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A045 557, Price codes: A04 in paper copy, A01 in microfiche. Annual Report 1977. 69 p, 33 fig, 7 tab, 7 ref.

Descriptors: *Analytical techniques, *Instrumentation, Electrolytes, *Electrodes, *Adsorption, *Solutes, Organic wastes, Performance, Monitoring, Ozone, Disinfection, Water treatment, Water purification.

The Breadboard Electrochemical Organic Content Analyzer was developed to be interfaced with the Water Processing Element Pilot Plant and its data acquisition system. The analyzer was designed to monitor organic solute concentrations based on adsorption of the solutes on an indicating electrode, and measurement of the resulting decrease in the electrodes interfacial capacitance. The analyzer was capable of longterm, continuous monitoring of the ozonated effluent. The addition of electrolyte to the sample was an effective means of eliminating measurement errors resulting from changes in the pH and conductivity in the sample. The electrolyte used demonstrated the ability to avoid interferences from 03, Cl(-), NO3(-), and SO4(-2). There was no interference from 02, and there were no temperature effects. (Small-FIRL)

PILOT PLANT STUDIES TO EFFECT CHRYSOTILE ASBESTOS FIBRE REDUCTION DURING POTABLE WATER TREATMENT,
Ontario Ministry of the Environment, Toronto.
R. B. Hunsinger, J. Lawrence, and K. J. Roberts.
Technical Report 67, 1977, 37 p, 1 fig, 3 tab, 12 ref, 3 append.

Descriptors: *Potable water, Water treatment, *Filtration, *Asbestos, *Pilot plants, Turbidity, Efficiency.

Pilot plant studies incorporating conventional potable water pre-treatment and filtration were performed to assess asbestoiform fiber removal. Problems were encountered in consistent fortification of the pilot plant feed water with sufficient asbestos to make measurement of removal possible. Optimized conventional treatment did significantly reduce asbestos levels. Unfortunately, given the current state-of-the-art in counting technology, treatment efficiency cannot be determined accurately. No direct relationship was established between fiber concentration and turbidity, although low fiber concentration was generally associated with low turbidity. (Small-FIRL)

ACTIVATED CARBON ADSORPTION OF TRACE ORGANIC COMPOUNDS,
Illinois Univ. at Urbana-Champaign. Dept. of Civil and Ceramic Engineering.
V. L. Snoeyink, J. J. McCreary, and C. J. Murin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 253, Price codes: A07 in paper copy, A01 in microfiche. Technical Report EPA-600/2-77-223, 1977. 115 p,

42 fig, 17 tab, 70 ref.

Descriptors: *Adsorption, *Activated carbon, *Organic matter, *Organic compounds, Isotherms, *Humus, *Odor, Potable water, Fluorescence, Water treatment, Humic acids.

Activated carbon adsorption of humic substances and trace contaminants 2-methylisoboreol (MIB), geosmin, the chlorophenols and polynuclear aromatic hydrocarbons (PAH) was investigated under competitive adsorption conditions encountered in natural waters. Isothermal tests and small-scale laboratory columns were used. Humic substances were obtained from a commercial source, well water, leaf extract and soil extract. Significant differences were observed in adsorption, haloform formation potential, and fluorescence. A method for the synthesis of MIB was developed along with a gas chromatographic analytical technique for MIB and geosmin (0.1 microgram/liter). These naturally occurring odorous compounds were more strongly absorbed than humic substances which compete with MIB and geosmin for adsorption sites. Chlorophenols and PAH's were strongly adsorbed. Anionic and neutral species of 2,4-dichlorophenol and 2,4,-6-trichlorophenol competed for adsorption sites even at a concentration of 1 microgram/liter. Except at a pH of 7.0, the observed data conformed to the Langmuir model for competitive adsorption, or the Jain and Snoeyink modification of the Langmuir model. A significant reduction in chlorophenol adsorption capacity resulted with the presence of various humic substances. Also, humic acid did not interfere with the rate of adsorption of anthracene, a model polynuclear aromatic hydrocarbon. (Small-Firl)

INACTIVATION OF VIRUSES IN WATER BY BROMINE AND ITS COMPOUNDS: INFLUENCE OF VIRION AGGREGATION,
North Carolina Univ. at Chapel Hill. School of Medicine.
D. G. Sharpe, and J. D. Johnson.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A048 622, Price codes: A06 in paper copy, A01 in microfiche. Final Report, 1977, 103 p, 51 fig, 40 ref.

Descriptors: *Viruses, Diseases, *Bromine, *Disinfection, Water purification, Electron microscopy, *Hydrogen ion concentration, *Aggregates, Particle size.

The inactivation of poliovirus and reovirus by bromine in water was investigated. OBr(-) reacted most rapidly with dispersed poliovirus reducing plaque-forming infectivity about 3 log(10) units/sec at a concentration of 9.6 at 2C and pH 11. The rate of inactivation with Br2 at pH 5 was 0.8 log (10) units/sec. Corresponding rates with HOBr, NBr3, and NHBr2 were 0.12, 0.035, and 0.004 log(10) units/sec at pH 7. Reovirus was more sensitive to HOBr than polio virus, but when aggregation was present, reovirus survived bromine treatment that destroyed well dispersed poliovirus. Aggregated preparations of both viruses reacted with HOBr with a continuously decreasing reaction rate. The most resistant units were the larger aggregates. Electron microscopy demonstrated that virus particles are generally aggregated in the crude or unpurified state. Experimental techniques to determine aggregation were developed, and the fate of aggregates in different types of water and at different pH levels, was investigated. (Small-Firl)

CRITERIA FOR THE PRODUCTION OF HIGH PURITY WATER,
Army Medical Bioengineering Research and Development Lab., Fort Detrick, MD.
J. J. McCarthy.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A049 032, Price codes: A04 in paper copy, A01 in microfiche. Technical Report 7714, 1977. 63 p, 18 tab, 67 ref.

Descriptors: *Specifications, Water quality, *Water purification, *Laboratories, *Hospitals, Ion exchange, Reverse osmosis, Distillation, Filtration, Adsorption, *Water pollution.

Information is presented which should be considered during the design or specification of high purity water production systems in health care facilities and laboratories. Water quality is discussed, and summaries of commonly used water quality criteria are presented. Design considerations are discussed for ion exchange, reverse osmosis, distillation, filtration, and carbon adsorption techniques. Design considerations for the distribution and storage of high purity water are discussed including construction materials and centralized versus decentralized systems. Water quality should be monitored periodically to ensure suitability for use and to make possible the detection of contaminants developed during production, storage, and distribution. (Small-FIRL)
W79-06354

ALTERNATIVES TO CHLORINATION FOR CONTROL OF CONDENSER TUBE BIOFOULING,
Monsanto Research Corp., Dayton, OH.
H. H. S. Yu, G. A. Richardson, and W. H. Hedley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 269, Price codes: A05 in paper copy, A01 in microfiche. Report EPA-600/7-77-030. March 1977. 74 p, 14 fig, 9 tab, 28 ref.

Descriptors: *Cooling water, *Fouling, *Powerplants, *Chlorination, *Water treatment, Bromie, Ozone, Iodine, Radiation, Cleaning, Condensers.

Better techniques of chlorination or alternatives to chlorination of power plant effluent for preventing bio-fouling in cooling systems, especially condenser tubes, were evaluated. The assessments were directed toward reducing free-chlorine residuals in effluent released into receiving waters where chlorinated compounds may have toxic effects on aquatic microorganisms or may enter drinking water supplies. Parameters evaluated and compared in the study included: technical feasibility; environmental effects; engineering problems; relative capital, operational, and chemical costs; actual dollar costs; and present state of technology. Chemical applications evaluated for treating fresh or marine cooling water in once-through or closed cycle systems included: chlorine, bromine, chloride, iodine, ozone, chlorine dioxide, hypochlorite, and controlled-release pesticides. On-line mechanical cleaning of condenser tubes in cooling systems were also considered; these included the utilization of sponge rubber balls, bruch devices, or hot water backflushing. Ultraviolet and gamma radiation were evaluated as physical-chemical treatments. Improved procedures of chlorination as alternatives to continuous chlorination included: dosing at the inlet of condensers, serially; dechlorination; chlorination by feedback control of residuals; and blowdown timing control. (Lisk-FIRL)

OIL/WATER SEPARATION STATE-OF-THE-ART,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Chemical and Biochemical Engineering.
F. A. Osamor, and R. C. Ahlert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 755, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-78-069, 1978. 104 p, 10 fig, 4 tab, 176 ref.

Descriptors: Oil industry, *Evaluation, *Oil pollution, Oil wastes, Oily water, Oil-water interfaces, *Separation techniques, Water quality control, *Testing, Ships.

The state-of-the-art of oil and water separation devices and processes was investigated. The technology available for shipboard and shoreside treatment of bilge and ballast waters and the oily waste water associated with crude oil production was considered. Separation devices were classified according to the primary mechanisms that induce separation of oil/water mixtures. The basic concepts of each class of equipment, design features, operational conditions, and device limitations are discussed. Literature on test evaluation of devices was critiqued on the basis of actual or potential success in treating various oil/water systems. No single technique can separate all oil/water system states efficiently. (Small-FIRL)

A THEORY ON WATER FILTRATION, PART I: BACKGROUND,
Civil and Environmental Engineering Development Office, Tyndall AFB, FL.
S. P. Shelton.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A045 387, Price codes: A03 in paper copy, A01 in microfiche. Report CEED0-TR-77-1, 1977. 34 p, 2 fig, 1 tab, 49 ref, 1 append.

Descriptors: *Filtration, Aerosols, *Efficiency, Water treatment, *Mathematical models, Flow, Suspended solids.

Background is given for a project which applied existing theoretical concepts used in aerosol mechanics to various water filtration systems. Equations were developed to describe the water filtration processes as a function of the characteristics of the fluid, suspended particles, and filter media. Information is presented on small particle collection, air filtration efficiency, and the effects of flow, pressure, and time. (See W79-06388 and W79-06389) (Small-FIRL)
W79-06387

A THEORY ON WATER FILTRATION PART II. MODEL PRESENTATION,
Civil and Environmental Engineering Development Office, Tyndall, AFB, FL.
S. P. Shelton.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A045 607, Price codes: A02 in paper copy, A01 in microfiche. Report CEEDO-TR-77-2, 1977. 18 p, 1 fig, 24 ref.

Descriptors: *Filtration, Aerosols, Water treatment, *Efficiency, Sands, *Mechanical properties, *Suspended solids, Mathematical models.

Existing theoretical concepts used in aerosol mechanics were applied to various water filtration systems. These equations were then used to described water filtration processes as a function of the characteristics of the fluid, suspended particles, and filter media. The model integrates numerically to determine the pressure drop caused by the sand, the suspended particles collected in the sand, and the filter efficiency for both the sand and the suspended particles (the cake) at different time increments. Also, it computes the average efficiency from the start to any point in the filter cake. The sand bed and filter cake characteristics are then modified for each increment to reflect the net change in their characteristics caused by particles collected during the previous integration increment. A THEORY ON WATER FILTRATION, PART III - SENSITIVITY ANALYSIS, DATA EVALUATION AND CONCLUSIONS,

Civil and Environmental Engineering Development Office, Tyndall Air Force Base, FL.
S. P. Shelton.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A043 290, Price codes: A03 in paper copy, A01 in microfiche. Report CEEDO-TR-77-3, 1977. 37 p, 5 fig, 8 tab, 61 ref.

Descriptors: *Filtration, Aerosols, Water treatment, *Efficiency, Sands, Mechanical properties, *Suspended solids, *Mathematical models, Flow.

Existing theoretical concepts used in aerosol mechanics were applied to various water filtration systems. These equations were used to describe water filtration processes as a function of the characteristics of the fluid, suspended particles, and filter media. These models were examined from the standpoint of their interrelated parameters and their applicability to known filtration data. The sand filtration model demonstrated a potential to predict the relationship between flow, pressure, time, and efficiency. Data validation of the model indicated that its predictions were within the range of predictions made by classical water filtration models for typical data ranges. Also, the new model could predict filter efficiency for a wide range of fluid-particle suspensions and filter media. (See also W79-06387) (Small-FIRL)

GROUND-WATER CONTAMINATION BY FERTILIZER NITROGEN,
Science and Education Administration, Fort Collins, CO.
H. R. Duke, D. E. Smika, and D. F. Heermann.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineering, Vol 104, No 1R3, p 283-291, September, 1978. 6 fig, 2 tab, 8 ref.

Descriptors: *Irrigation programs, *Water pollution, *Leaching, *Nitrates, Fertilizers, Denitrification, Water management, Groundwater.

A partial analysis is presented of the results of studies on the effects of irrigation practices on the movement of water and nitrate toward the water table. The study area was an alluvial valley of the South Platte River near Crook, Colorado. Four sandy plots, irrigated with center pivot sprinkle systems, were instrumented to measure directly all components of the water budget during the growing season. Vacuum extractors were installed beneath each plot to measure deep percolation. Water samples for NO3-N analysis were collected periodically from each extractor, from irrigation and stock wells, and from piezometers. Soil samples were also collected. Three of the plots were irrigated according to the USDA irrigation scheduling program. A fourth plot was irrigated nearly continuosly which resulted in leaching of significant amounts of NO3-N beyond the root zone. A high concentration of 50 ppm was found near the water table but decreased rapidly with depth. This may be due to the denitrification effect of microbial activity or ferrous iron in the anaerobic region of the aquifer. If significant denitrification occurs, the potential for groundwater pollution by leached nitrates is considerably reduced. However, careful water management remains an important factor in the irrigation program. (Purdin-NWWA)
W79-06081

THE INTEGRITY OF WATER,
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 238, Price codes: A10 in paper copy, A01 in microfiche. Proceedings of a Symposium, March 10-12, Washington, DC, 223 p, 84 fig, 10 tab, 153 ref. Environmental Protection Agency, Washington, DC.

Descriptors: *Water quality, *Federal Water Pollution Control Act Amendments of 1972, Environmental effects, Human population, Groundwater, Surface waters, Physical properties, Chemical properties, Biological properties.

The twenty-two papers presented at an invitational symposium focus on the definition and interpretation of water quality integrity as viewed and discussed by representatives of State governments, industries, the academic community, conservation and environmental groups and the general public. The quantitative and qualitative characteristics of the physical, chemical, and biological properties of surface and groundwater were addressed. (Davison-IPA)

GREAT LAKES RESEARCH ADVISORY BOARD ANNUAL REPORT TO THE INTERNATIONAL JOINT COMMISSION,
1978. 64 p, 1 fig, 2 tab, 30 ref.

Descriptors: Great Lakes region, *Great Lakes, *Toxins, Water pollution, *Phosphorus, Water quality standards, *Ecosystems, *Data storage and retrieval, Dredging, Solid wastes, Water quality.

The past activities of the principal scientific advisor to the Commission on Great Lakes water quality (US-Canada) are discussed as they relate to three concerns: toxic substances, water quality and the Great Lakes ecosystem, and phosphorus limitations. Governments are requested to coordinate efforts to identify existing data bases and develop new data bases with information on physical, chemical, and toxicological data. An immediate joint effort to review and assess alternative dredged material disposal policies is recommended. Also, a recognized policy is needed for an ecosystem approach to water quality management. Further, studies are recommended to determine the most cost-effective programs for reducing phosphorus loadings. (Small-Firl)
W79-06125

GREAT LAKES WATER QUALITY SIXTH ANNUAL REPORT TO THE INTERNATIONAL JOINT COMMISSION,
1978. 89 p, 6 fig, 20 tab.

Descriptors: *Great Lakes region, *Legislation, *Water quality, Regulation, Priorities, Toxicity, *Chemical wastes, Public health, Environmental effects, Governments.

Progress by the Great Lakes Water Quality Board toward compliance with the original 1972 Water Quality Agreement is discussed. Recent water quality, remedial programs, legislation, and water quality board activities are described. A review is presented of previous assessments and recommendations of the Water Quality Board, and water quality objectives. Due to the presence of low concentrations of toxic chemicals, the board recommends that governments develop rational schemes to order priorities for evaluating the risk of toxic chemicals to human health and environment. It is also recommended that governments initiate programs to control the production, use and disposal of chemicals that are potentially toxic. (Small-FIRL)

CRITERIA OF WATER QUALITY IN RELATIONSHIP WITH THE FINAL USE OF THE RECEIVING BODY AND ITS ASSIMILATION CAPACTIY (CRITERIOS DE CALIDAD DEL AGUA EN RELACION CON EL USO FINAL DEL CUERP RECEPTOR Y SU CAPACIDAD DE ASIMILACION),
Esso S.A.P.A., Argentina.
A. H. Torrea, E. Alvarez, N. E. Catarineu, and L. Peisojovich.
ATIPCA (Asociacion de Tecnicos de la Industria Papelera y Celulosica Argentina), Vol. 17, No. 2, p 2, 6-10, 12, 16-18, 20-21, 1978. 20 ref.

Descriptors: *Water quality, *Waste assimilative capacity, *Surface waters, Water quality control, South America, Argentina.

The application of water quality criteria based on the final use of the receiving water body and its assimilation capacity permits establishing levels of quality resulting in reduced effluent treatment requirements. Concepts are developed on the determination of the final use of a receiving body. Methodology is analyzed for establishing the assimilation capacity of the receiving body through various formulae. Taking these aspects into account, methods are suggested for evaluating the cost-benefit relationship in making a decision with the object of utilizing to the maximum the particular conditions of a receiving water body. A regional system for water quality control in Argentina is proposed. (Speckhard-IPC)

EFFICIENT AMENDMENT USE IN SODIC SOIL RECLAMATION,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel). Inst. of Soil and Water.
R. J. Prather, J. O. Goertzen, J. D. Rhoades, and H. Frenkel.
Soil Science Society of America Journal, Vol 42, No 5, p 782-786, September-October, 1978. 8 fig, 5 tab, 9 ref.

Descriptors: *Reclamation, Alkali soils, *Soil amendments, Calcium sulfate, Gypsum, Calcium chloride, Sodium, *Leaching, Regression analysis.

A laboratory column study of sodic soil reclamation was carried out using two soils high in exchangeable sodium percentage (ESP) and cation exchange capacity (CEC). Three amendments ($CaSO_4.2H_2O$, $CaCl_2.2H_2O$, and H_2SO_4) were used singly and in combination to test their effectiveness and efficiencies with respect to amount of amendment, time, and leaching needed. As a single amendment, H_2SO_4 was more effective than $CaSO_4$ and results in a more desirable ESP profile than $CaCl_2$. Combining either $CaCl_2$ or H_2SO_4 with $CaSO_4$ (proportions of 1/4 and 3/4, respectively) appreciably reduced the time and leaching needed to achieve reclamation as compared with $CaSO_4$ alone. It was observed that certain soil conditions preclude or make undesirable the use of $CaSO_4$ alone and combining amendments results in effective reclamation and a potential savings in amendment costs. (Skogerboe-Colorado State)

DETERMINING WATER QUALITY CRITERIA FOR WATER FLOW IN SOLVING THE PROBLEMS OF CONTROLLING WATER POLLUTION,
Kh. A. Velner, V. I. Gurariy, and A. S. Shayn.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Kharkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 193-205 (Discussion p 206-207), September 1978. 1 fig, 3 tab, 14 ref. EPA-600/9-78-024.

Descriptors: *Water pollution control, *Flow, *Water quality criteria, *Soviet Union, Effects, Assessment, Equations, Questionnaires, Decision making, Water bodies, Classification, Statistical methods.

In the Soviet Union, water quality improvement is considered one of the most important economic and political problems at the present stage of social development. Needed are methods for the objective assessment of water quality. First, water quality must be defined quantitatively; developing a state system of quality control includes problems of planning, forecasting and optimization. Information based only on water quality evaluation by individual properties does not provide an adequate problem solution. Laws in the USSR set maximum permissible concentrations for harmful substances in impoundments and water courses and define the water quality in a reservoir for drinking water, recreation, and fish breeding. However, some deficiencies have been found in the existing criteria for water quality assessment from the design and maintenance of water installations. The decision-making procedure is not purely mathematical in character, having certain psychological attributes. VNIIVO's mathematical modeling lab distributed a questionnaire among experts, selecting the most significant parameters and evaluating them on a five-point system. The mean statistical value for each parameter, the frequency of possible maximum estimates, sum of ranks, and also probability characteristics, variance coefficient, concordance coefficient, and the statistical significance of the level of agreement among the experts were determined. Needed is a common system of water quality indexing. The application of analytical-expert methods allows establishment of a common approach to the problem of developing water quality criteria for water management systems. EFFECTS OF CHANNEL DAMS ON DISSOLVED OXYGEN CONCENTRATIONS IN NORTHERN ILLINOIS STREAMS,
Illinois State Water Survey, Urbana.
T. A. Butts, and R. L. Evans.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 924, Price codes: A08 in paper copy, A01 in microfiche. Circular 132, 1978. 153 p, 6 fig, 6 tab, 14 ref, 1 append.

Descriptors: *Reaeration, *Streams, *Illinois, *On-site investigations, Dissolved oxygen, Water quality, Dams, Aeration, Data collections, Overflow, Spillways, Analytical techniques, Methodology.

This study was performed for the Northeastern Illinois Planning Commission (NIPC) to provide data for input into a comprehensive water quality model being developed for NIPC in conjunction with their Areawide Waste Treatment Management Study. The principal objective of this study was to gather physical data concerning the aeration characteristics of the dams for use in calibrating weir formulas developed in Great Britain. This entailed measuring upstream and downstream DOs and temperatures for extended time periods and determining the physical measurements and characteristics of the dams. In all, 53 different structures exist at 48 locations on study area streams. At 5 of those locations, 2 different spillway or release structures exist side by side. Forty of the 53 structures were sampled at 15-minute intervals for at least 4-hour segments. Detailed results observed and recorded in the field were presented in the appendix. Two photographs were shown for some structures to illustrate structural details more clearly or to show different flow conditions. It was concluded that most channel dams and weirs studied significantly affect water quality in almost all major study area streams. These effects should be incorporated into any mathematical model dealing with dissolved oxygen. This report was prepared for use as a preliminary guide. (Humphreys-ISWS)

FEDS PUSH FOR WHOLLY INTEGRATED STATE/EPA PROGRAMS,
C. W. Heckroth.
Water and Wastes Engineering, Vol. 15, No. 12, p 22-27, 30, December, 1978.

Descriptors: *Water pollution control federation, *Water quality control, *Integrated control measures, *Conferences, Toxins, Sludge disposal, Industrial wastes, Water reuse, Research priorities, Consolidation, Permits, Grants.

At the annual Water Pollution Control Federation meeting many topics were discussed. Among them were state-federal Environmental Protection Agency (EPA) agreements, pretreatment standards, toxic pollutants, national municipal policy and strategy, '208' programs, future legislation, Congress-EPA conflicts, water reuse, managing grants and permits, and a national research program. Speakers' conclusions are provided. One speaker said the EPA intends to consolidate its efforts by requiring each EPA region to enter into an annual agreement with its respective states covering all water and solid waste programs. Pretreatment standards for industrial plans are detailed herein. Control of toxic pollutants will be receiving more emphasis in the future and should constitute a major factor in formulating a national research program. Water reuse is being given top priority. Some ways in which EPA is encouraging water conservation are discussed. There is also a need to coordinate management of federal construction grants to municipalities, to insure compliance with the terms and stipulations of a community's National Pollutant Discharge Elimination System permit. The funding strategy for section 208 of the Clean Water Act is discussed. The '208' program gives state and area-wide agencies funds for implementing water quality management plans. (Horwich-Florida)

PERFORMANCE TESTING OF OIL MOP ZERO RELATIVE VELOCITY OIL SKIMMER,
Mason and Hanger-Silas Mason Co., Inc., Leonardo, NJ.
M. K. Breslin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 232, Price codes: A03 in paper copy, A01 in microfiche. Report EPA-600/7-78-060, 1978. 20 p, 7 fig, 2 tab, 2 append.

Descriptors: *Skimming, *Oil spills, Water pollution control, Oily water, *Prototypes, *Testing, *Separation techniques, Adsorption, Performance, Running waters, Mechanical equipment.

A fast current prototype skimmer designed and built by OMI with an operating range up to 3 m/sec, was tested. Oil was adsorbed onto oleophilic fibers woven into a rope. The rope and fibers were then squeezed by wringers to remove the oil. The device was operated in a controlled oil slick and monitored for oil recovery. Controlled independent variables included operating speed, oil slick thickness, tow speed, and wave conditions. Fluid recovery was sampled during and after the test run to determine skimmer performance. Results were evaluated in terms of recovery rate, recovery efficiency, and throughput efficiency. Only eight oil-collection test runs were made over two days because of adverse weather and problems with the device. Thus, parameters could not be completely optimized. (Small-FIRL)

Descriptors: *Oil spills, Oil pollution, *Testing, *Skimming, Mechanical equipment, *Performance, Evaluation, Waves(Water), Weather, Oceans.

Three off-shore skimming devices were evaluated as part of the assessment and evaluation of technology and procedures for controlling and cleaning up oil spills in the marine environment. Throughput efficiency, recovery efficiency, and oil recovery rate, were determined for the Cyclonet 100, MARCO class V Oil Skimmer, and the U.S. Coast Guard Skimming Barrier (CGSB). Test variables included several wave conditions and tow speeds to simulate harbor and offshore environments. Performance was maximum at speeds through the water of 1.5 m/sec or less, even in calm water. As wave conditions become more severe, performance deteriorates. Even relatively low breaking waves render the pickup devices effectively useless. Performance was better using the heavier of the two oils tested. Thus, effective use of the equipment depends on extremely favorable weather conditions. Further research and development are needed to establish effective cleanup methods which are effective in more severe sea conditions. (Small-FIRL)

Field 6—WATER RESOURCES PLANNING

Group 6A—Techniques Of Planning

The American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management examines methodological questions related to simulation and optimization modeling of processes that determine water quality of river basins. Discussants describe the general state of development and application of mathematical models designed to predict and optimize water quality management in the USA and USSR. Subjects of papers presented by American and Soviet specialists include: planning comprehensive water quality protection systems; modeling water quality in river basins; geographic-economic aspects of pollution control systems; identification of ecosystem models by field data; management decisions for lake systems on a survey of trophic status, limiting nutrients, and nutrient loadings; a descriptive simulation model for forecasting the condition of a water system; mathematical ecosystem models and a description of the water quality in water bodies; mathematical modeling strategies applied to Saginaw Bay, Lake Huron, to eutrophical processes in Lake Ontario, to hydrodynamics and dispersion of contaminants in the nearshore, and to coastal currents in large lakes; and the construction of a model of Lake Baikal on the principles of self-organization. Publication of the proceedings held December 9-16, 1975, in Kharkov and Rostov-on-Don, USSR, is in compliance with the Memorandum from the Fourth Session of the Joint American-Soviet Committee on Cooperation in the Field of Environmental Research. PLANNING COMPREHENSIVE WATER QUALITY PROTECTION SYSTEMS,
Cornell Univ., Ithaca, NY. Dept. of Environmental Engineering.
D. P. Loucks.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Kharkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 1-33, September 1978. EPA-600/9-78-024. 3 fig, 15 ref.

Descriptors: *Comprehensive planning, *Water quality, *Protection, *Economic efficiency, *Optimization, *Simulation analysis, *Analytical techniques, *Model components, *USSR, *Cost minimization, Constraints, Mathematical models, Systems analysis, Mixed-integer programming, Linear programming, Nonlinear programming, River basins, Waste water(Pollution), Flow augmentation, Aeration, Land disposal.

This paper outlines several approaches to water protection modeling, emphasizing problem definition and model development. Reviewed is a number of mathematical modeling components which can be combined and solved for the preliminary planning of minimum cost, comprehensive water quality management programs for river systems. The techniques considered hopefully reflect an approach to long-run water quality protection planning that might be appropriate for various rivers in the USSR. The use of both optimization and simulation models permits the identification of those particular measures, their design specifications, and their operating policies, that will satisfy water quality, economic, and possibly other objectives. The optimization techniques herein have been developed for: wastewater treatment facilities; wastewater effluent storage lagoons; land disposal sites for wastewater disposal and additional treatment; flow augmentation reservoirs; and in-stream aeration devices. The models are static. Discussed are nonlinear, linear, separable, and mixed-integer programming, the last being recommended as the solution technique. The systems models and methods illustrated herein are not substitutes for judgment, but rather are aids to it in providing information and opportunities that otherwise might not be available. OPTIMIZATION OF WATER QUALITY CONTROL IN A RIVER BASIN,
A. K. Kuzin.
In: American Soviet Symposium on Use of Mathematical Model to Optimize Water Quality Management. Kharkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 36-52, September 1978. EPA-600/9-78-024. 2 fig, 12 ref.

Descriptors: *Water quality, *Protection, *River basins, *Optimization, *Methodology, *Mathematical models, *Decision making, Effluents, Treatment, Lagoons, Flow autmentation, Investment, Long-term planning, Analytical techniques, Systems analysis, Equations.

Water quality is considered in the development of a long-term optimum strategy determining capital investment policy in the USSR. The basin water protection programs, part of the nation's overall water protection program, are based on strategic objectives for 10 to 15 years. Weighty socio-economic prerequisites favor the basin approach to the control of water quality-effect factors. There are at least two ways of constructing an economic-mathematical model for optimization of anti-pollution measures on a drainage basin scale: construction of a united 'super-model' or a system of small mutually matched models. A number of serious shortcomings of a practical nature limit the use of 'super-models'. Optimization problems in the field of water protection are divided into three classes: Class 1 - problems of optimizing functionally different technical facilities; Class 2 - problems of interaction of differing facilities; and Class 3- problems of optimizing operationally different technical solutions. Investigation of relations among these has shown that during the optimization of water protection measures within the limits of a basin or basin section, a multilevel system of models can be developed, requiring a multilevel approach. Discussed are the stages in solving an optimization problem, and typical optimization problems for water protection measures are described. Widespread use of the decision-making optimization methodology outlined herein will yield high economic profits to the national economy. (See also W79-06166) (Bell-Graf--Cornell)

WATER QUALITY MANAGEMENT MODELS: SPECIFIC CASES AND SOME BROADER OBSERVATIONS,
Meta Systems Inc., Cambridge, MA.
R. J. DeLucia, and T. Chi.
In: American Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Kharkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 92-124, September 1978. EPA-600/9-78-024. 9 fig, 1 tab, 28 ref.

Descriptors: *Water quality, *Management, *River basins, *Planning, *Mathematical models, Optimization, Constraints, Pollutants, Treatment facilities, Costs, Biochemical oxygen demand, Dissolved oxygen, Constraints, Timing, Equations, Systems analysis, Capacity expansion, Cost minimization, Linear loss function, Convex separable programming, Size, St John River basin model, Descriptive modeling, Prescriptive model.

There is no one prescribed approach for model building for investment planning in water quality control. The development of a water quality model is dependent on the characteristics of the problem being examined. Considered herein are four areas of concern that influence model development: (1) the relationship of planning activity to the problems of variable specifications; (2) the nature of the institutional or client setting; (3) the type and quality of data available for model development; and (4) the availability of resources for model development and implementation. Discussed is the Saint John River basin model, whose development provides an example in which many important issues in these four areas arise; highlighted are the most significant issues. The notable features of the discussions which led to the development of th model in its present form are considered. Discusse in detail is the need to calibrate/verify the descrip tive relationships in water quality modeling. It concluded that there are two types of applicatio or implementation problems associated with th use of water quality planning models: (1) accept ance of a descriptive or prescriptive model for us in an actual water quality planning study and (2 the implementation of a water quality plan that i based at least partially on a study in which a mode has been used. It is recommended that a wast discharger be required to provide evidence t show his innocence in polluting, regarding an discharge believed to be harmful to the environ ment, instead of the present procedure whic allows the polluter to be regarded innocent unti proven guilty. An example of optimal capacity expansion of treatment facilities is given. (See also W79-06166) (Bell-Graf--Cornell)

MODELING AND DECISION-MAKING AS PECTS OF WATER QUALITY MANAGEMENT
Environmental Protection Agency, Washington DC. Water Planning Div.
M. A. Pisano.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Kharkov and Rostov-on-Don, USSR December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 180-190 (Discussion 191-192), September 1978. 2 fig, 3 tab. EPA-600/9-78-024.

Descriptors: *Water pollution control, *Decision making, *Mathematical models, *Water quality analysis, Planning, Evaluation, Dissolved oxygen, Evaluation, Rivers, United States, Methodology, Systems analysis.

This paper gives an overview of how approaches and concepts considered in several of the papers presented at this symposium may be utilized in the solution of complex water quality problems. These papers discuss key economic and political concepts that are used in the water quality management planning process of the United States. Also, the papers discuss some specific case study applications of these modeling approaches, as well as how some of the major planning concepts were employed in a particular area. Modeling, water quality analysis, and comprehensive planning approaches have played a very fundamental role in the implementation of our Federal Water Pollution Control Program. This paper describes that role and provides an assessment of modeling as it has contributed to our water quality management decisions. Considered is how the above approaches and concepts have been employed as a part of this role. (See also W79-06166) (Bell-Graf--Cornell)

IDENTIFICATION OF ECOSYSTEM MODELS BY FIELD DATA (INVERSE PROBLEMS OF ECOLOGY),
Akademiya Nauk URSR, Kiev. Inst. Hidrobiologii.
V. B. Georgiyevskiy.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Kharkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 263-279 (Discussion p 280-281), September 1978. 7 ref. EPA-600/9-78-024.

Descriptors: *Ecosystems, *Model studies, *Differential equations, *Field data, *Stochastic processes, *Model parameters, *Integral transformations, Algorithms, Dynamic model, Cartesian coordinates, Water biocenosis, Complete smoothing, Curvilinear orthogonal coordinates, Algebraic equations, Statistical models, Numerical analysis, Systems analysis, Plankton.

Proposed is the construction of ecosystem models to be identified herein on the basis of conventional

differential equations (dynamic models) and in partial derivatives. Identification is the determination of numerical values of coefficients for use in differential equations by first-hand observation of biotic and abiotic components of an ecosystem in a certain region. In ecology, problems of this kind are examined by identifying objects of automatic control. The usual identification method is to select numerical values for the model parameters which minimize the mean square difference between the observed and calculated trajectories. But ecological problems possess traits which hamper this approach. Given are the characteristics of inverse problems in ecology which necessitate identification without using solution of the direct boundary conditions. Proposed is the use of a method which does not use the solution of direct boundary equations; the method can be based on integral transformations of differential equations of ecological models aimed at excluding the experimental functions differential operation. Considered herein are: (1) type of differential equations of water ecosystem models; (2) model parameters as systemic characteristic of water biocenosis; (3) method of integral transformations; (4) minimum complexity integral transformation I for an equation with Cartesian coordinates; (5) integral transformations of complete smoothing for equation with Cartesian coordinates and for equations in general curvilinear orthogonal coordinates; (6) determination of variable and of dependent parameters; and (7) parameter determination with inadequate information available. Descriptors: *Reservoir design, *Reservoir operation, *Model studies, *Optimization, *Linear programming, *Stochastic processes, *Decision making, Benefit maximization, Screening model, Water resources development, *River basins, Planning, Multiple-purpose reservoirs, Algorithms, Equations, Operations research.

Optimization models offer a valuable tool to the river basin planner. This report is the result of research in water resources multi-methodology. To solve the complex problems of simultaneous design and operation of reservoirs, much work has been accomplished in the joint use of optimization and simulation models, where the optimization model is used as a screening tool to identify a range of alternatives worthy of more detailed analyses to be carried out by the simulation model. The phase of this research reported herein concentrates on the derivation of an improved screening model, working with ReVelle's Linear Decision Rule (LDR) and Louck's Sequential Explicit Stochastic Linear Programming (SESLP) models. These two models are restructured and extended. A reformation of the SESLP models results in a substantial reduction in computational burden so that the models are now usable for realistic systems. The LDR model is extended to explicitly include economic benefits or losses. Energy generation is also considered for the first time in the LDR model and a new perspective on the water supply potential of a reservoir system is given. (See also W79-06186) (Bell Graf-Cornell)

OPTIMAL DESIGN AND OPERATION OF MULTI-RESERVOIR SYSTEMS: VOLUME II, ALTERNATIVE OPTIMIZATION MODELS OF THE LEHIGH RIVER BASIN,
Johns Hopkins Univ., Baltimore, MD.
M. H. Houck, and J. L. Cohon.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 018, Price codes: A08 in paper copy, A01 in microfiche. Prepared for National Science Foundation, Washington, D.C., Report No SAE-PDM-76-02, June 1976. 144 p, 46 fig, 48 ref.

Descriptors: *Reservoir design, *Reservoir operation, *Model studies, *Optimization, *Linear programming, *Stochastic processes, *Streamflow, *Simulation analysis, *Screening model, *Dynamic programming, *Chance-constrained programming, Lehigh River basin, Planning, Water policy, Water resources development, Costs, Water storage, Economics, Systems analysis.

This report is the result of research in water resources multi-model methodology. To solve the complex problems of simultaneous design and operation of reservoirs, much work has been accomplished in the joint use of optimization and simulation models, where the optimization model is used as a screening model to identify a range of alternatives worthy of more detailed analyses to be carried out by the simulation model. One phase of this research concentrated on the derivation of an improved screening model, emphasizing ReVelle's linear decision rule and Louck's stochastic linear programming model. The other major research task--the subject of this Volume II--was to develop an additional model for multi-model approaches to river basin planning, a policy model used for deriving optimal operating policies for the system developed by the screening model. The result would be a 'three-model' methodology, where the design from the screening model and the operating rules from the policy model would be fed into the simulation model for further analyses. This volume reports on the testing of various combinations of previously developed reservoir system models in order to identify reasonable methodologies. The models considered include: a mean year deterministic linear program, a multi-year deterministic linear program, a chance-constrained linear program, the sequential explicit stochastic linear program (Loucks), and a deterministic dynamic program. Each of these models was formulated, programmed, and solved for the Lehigh River Basin which presented rich data sources. The chance-constrained programming model using linear decision rule was found to be superior on the basis of all relevant criteria. (See also W79-06185) (Bell Graf-Cornell)

GEOTHERMAL RESERVOIR SIMULATION 1. MATHEMATICAL MODELS FOR LIQUID- AND VAPOR-DOMINATED HYDROTHERMAL SYSTEMS,
Geological Survey, Reston, VA. Water Resources Div.
C. R. Faust, and J. W. Mercer.
Water Resources Research, Vol 15, No 1, p 23-30, February 1979. 4 fig, 25 ref.

Descriptors: *Geothermal studies, *Model studies, *Hydrothermal studies, *Mathematical models, *Thermal water, Porous media, Pressure, Enthalpy, Thermodynamics, Energy transfer, Steam, Hydrogeology, Equations.

Two alternative mathematical models are presented that are suitable for numerical simulation of geothermal reservoirs. The general mathematical model describes the three-dimensional flow of single-component water (both one and two phase) and the transport of heat in porous media. It is composed of two nonlinear partial differential equations, posed in terms of fluid pressure and enthalpy, and appropriate boundary conditions. An alternative quasi-three-dimensional model is derived by partial integration (in the vertical dimension) of the three-dimensional equations. The reservoir is assumed to have good vertical communication so that vertical equilibrium (gravity segregation) between steam and water is achieved. The resulting equations, posed in terms of vertically averaged pressure and enthalpy, include effects of an inclined, variable-thickness reservoir and mass and energy leakage to confining beds. (See also W79-06304) (Woodard-USGS)
W79-06303

GEOTHERMAL RESERVOIR SIMULATION 2. NUMERICAL SOLUTION TECHNIQUES FOR LIQUID- AND VAPOR-DOMINATED HYDROTHERMAL SYSTEMS,
Geological Survey, Reston, VA. Water Resources Div.
C. R. Faust, and J. W. Mercer.
Water Resources Research, Vol 15, No 1, p 31-46, February 1979. 13 fig, 4 tab, 44 ref.

Descriptors: *Geothermal studies, *Model studies, *Numerical analysis, *Hydrothermal studies, *Simulation analysis, Porous media, Vapor pressure, Enthalpy, Thermodynamics, Energy transfer, Hydrogeology, Equations, Evaluation.

Two numerical models are introduced for simulating three-dimensional, two-phase fluid flow and heat transport in geothermal reservoirs. The first model is based on a three-dimensional formulation of the governing equations for geothermal reservoirs. Since the resulting two partial differential equations, posed in terms of fluid pressure and enthalpy, are highly nonlinear and inhomogeneous, they require numerical solution. The three-dimensional numerical model uses finite difference approximations, with fully implicit Newton-Raphson treatment of nonlinear terms and a block (vertical slice) successive iterative technique for matrix solution. Newton-Raphson treatment of nonlinear terms permits the use of large time steps, while the robust iterative matrix method reduces computer execution time and storage for large three-dimensional problems. An alternative model is derived by partial integration (in the vertical dimension) of the three-dimensional equations. This second model explicitly assumes vertical equilibrium (gravity segregation) between steam and water and can be applied to reservoirs with good vertical communication. The resulting equations are posed in terms of depth-averaged pressure and enthalpy and are solved by a two-dimensional finite difference model that uses a stable sequential solution technique, direct matrix methods, and Newton-Raphson iteration on accumulation and source terms. (See also W79-06303) (Woodard-USGS)

SIMULATION OF STREAMFLOW OF ROCK RIVER AT LAKE KOSHKONONG, WISCONSIN, TO DETERMINE EFFECTS OF WITHDRAWAL OF POWERPLANT-COOLING WATER,
Geological Survey, Madison, WI. Water Resources Div.
W. R. Krug.
Geological Survey open-file report 79-253, January 1979. 21 p, 8 fig, 1 plate, 4 tab, 5 ref.

Descriptors: *Routing, *Streamflow, *Computer models, *Lakes, *Low flow, Consumptive use, Analytical techniques, Simulation analysis, Flow control, Nuclear powerplants, Diffusion, Thermal water, Cooling, *Wisconsin, *Rock River, *Lake Koshkonong.

A flow-routing model was used to simulate 44 years of stage data from Lake Koshkonong, Wis., and streamflow data from the Rock River downstream from the lake. The simulation was repeated for five possible degrees of consumptive use, ranging from zero to an annual average of 40 cubic feet per second. A minimum release rule was applied to the simulated operation of the dam at Indianford to guarantee at least the 7-day, 10-year low-flow discharge in the Rock River downstream from Lake Koshkonong. The simulated stage of Lake Koshkonong with consumptive use at 40 cubic feet per second was as much as 0.42 feet lower than the simulated stage with zero consumptive use for the same period. Duration of drawdown below the regulatory minimum stage of 11.8 feet, occurring

once in 10 years, increased from 83 to 132 days as consumptive use increased from 0 to 40 cubic feet per second. (Woodard-USGS)

FIELD VERIFICATION OF A ONE-DIMENSIONAL MATHEMATICAL MODEL FOR TRANSIENT COMPACTION AND EXPANSION OF A CONFINED AQUIFER SYSTEM,
Geological Survey, Sacramento, CA. Water Resources Div.
D. C. Helm.
In: ASCE Proceedings of the Specialty Conference on Verification of Mathematical and Physical Models in Hydraulic Engineering, College Park, Maryland, August 9-11, 1978, p 189-196, 1978. 6 fig, 2 tab, 9 ref.

Descriptors: *Land subsidence, *Pumping, *Groundwater, *Drawdown, *Computer models, Forecasting, Compaction, Water levels, Aquifer characteristics, Compressibility, Hydraulic conductivity, Hydrogeology, Permeability, Mathematical models, Aquifers, Confined water, Physical properties, Soil mechanics, Storage coefficient, Pressure, Simulation analysis, Evaluation.

Land subsidence due to ground-water withdrawal from a confined aquifer system is an expression at land surface of the net compaction at depth of the compressible layers within the system. Water-level fluctuations within coarse-grained aquifers produce boundary-stress changes on slow-draining compressible interbeds. A one-dimensional model has been applied to various field conditions ranging from a short-term test where 0.00048 meters of recoverable compaction (and subsequent expansion) of an overlying confining bed were measured during a 4-week aquifer test (including drawdown and recovery) to a long-term test where nearly 4 meters of subsidence occurred during 50 years of pumping overdraft. The model computes not only transient compaction and expansion at a site of interest but also the transient vertical distribution of preconsolidation pressure. This calculated stress distribution is used to estimate a critical depth to water needed either to initiate or to stop nonrecoverable compaction. Drawing on 15 sets of field data of stress and compaction, 15 sets of model values for average hydraulic conductivity and nonrecoverable compressibility are tabulated. Based on these estimated parameter values, future nonrecoverable compaction is predicted at each site for specified stress changes. (Woodard-USGS)

AN ANALYSIS OF THE FEASIBILITY OF SEPARATING EXPLORATION FROM PRODUCTION OF OIL AND GAS ON THE OUTER CONTINENTAL SHELF.
Office of Technology Assessment, Washington, DC.
Report May 1975. 227 p, 4 fig, 12 tab, 4 append, 7 attach.

Descriptors: *Resources development, Exploration, Production, *Outer Continental Shelf, *Oil and gas, Mid-Atlantic Bight, Southern California Bight, Gulf of Alaska, Leasing.

This study examines present practices and considers several alternative procedures by which exploration may be carried out prior to leasing and examines the advantages, disadvantages and uncertainties of each. The alternatives include three ranges of exploration effort--limited, intermediate, and full--by either government exploration teams or contracting industry teams through licensing procedures. The study keys on three of the twelve 'frontier' OCS areas as representative: the Mid-Atlantic (Baltimore Canyon), Gulf of Alaska, and Southern California. It appears feasible to separate exploration from production for the major prospects identified in the frontier areas in a limited or intermediate exploration program as defined in the report. However, since full exploration would require information obtained in the process of development and production of a region, it is probably not feasible or practical to conduct full exploration prior to production. Furthermore, OTA found that an intermediate program would merely be an extension of a limited program. Consequently, if separate exploration was desired, it could be initiated on a limited basis with the decision to extend to an intermediate level deferred. The analysis also found that, as certain benefits accrue from such a separation, it is likely that there will also be certain disadvantages or uncertainties of success, time loss and other impacts accruing from separation. These should be considered by policymakers in their deliberations. It should be noted further that there are possible alternatives to separation which could resolve, in part, the issues which raise the question of whether exploration should be separated from production. 6B. Evaluation Process

HYDRONOMIC ANALYSIS: A METHOD FOR REGIONAL ANALYSIS OF ECONOMIC AND WATER RESOURCES RELATIONSHIPS,
Yale Univ., New Haven, CT. School of Forestry and Environmental Studies.
A. P. O'Hayre.
Journal of Environmental Management, Vol 7, No 2, p 125-146, September 1978. 7 fig, 2 tab, 36 ref. OWRT A-033-MINN(2). 14-34-0001-7050.

Descriptors: *Hydrodynamics, *Regional analysis, *Economics, *Water resources, *Input-output analysis, *Water quality, *Effects, *Simulation analysis, *Lakes, Eutrophication, Environmental control, Monte Carlo method, Land use, Forest management, Water pollution, Systems analysis, Equations, Mathematical models, Nonpoint source pollution, Spatial variation, Timber harvest, Pulp wood harvest, Itasca County(Minn).

Previous efforts to predict regional economic and environmental relationships have proposed the use of discharged residuals as environmental criteria. Others have attempted to use models to relate discharged residuals to environmental quality parameters, but these models fail to represent the spatial dimension of pollution discharge, especially regarding non-point sources of pollution. This study was an attempt to develop a more realistic simulation of regional economic and environmental quality relationships by modeling the regional distribution of lake water quality resulting from the spatial distribution of pollutants from non-point as well as point sources. An input-output economic model of Itasca County, Minnesota was modified so that the spatial variation in pollutants discharged in association with economic activity in the region could be assessed. A regional indicator of lake water quality was developed from the distribution of lake trophic state. Monte Carlo simulation was used to derive the distribution of trophic state from the distribution of lake characteristics, land use activities and point source discharge of nutrients. The lake water quality model was calibrated for Itasca County, using sub-regions within the county. The method was used to determine the effect of forest management alternatives on economic conditions and lake water quality in the region. The results suggest that expansion of timber harvest has a minimal effect on lake water quality as long as all the increased pulp wood harvest is exported from the region. (Bell Graf-Cornell)

CHOOSING A POTABLE WATER SUPPLY: WHAT YOU NEED TO KNOW,
New Jersey Inst. of Tech., Newark.
H. S. Hundal, R. B. Trattner, and P. N. Cheremisinoff.
Water and Sewage Works, Vol 126, No 3, p 78-80, March, 1979. 1 fig, 3 ref.

Descriptors: *Potable water, *Surface water, *Ground water, Water sources, Water quality, Water treatment, Rivers, Lakes, Impoundments, Water harvesting, Aquifers, Water wells, Safe yield, Pumping, Artificial recharge, Springs, Infiltration galleries.

Various types of surface and subsurface sources of potable water are discussed in terms of their quality and treatment requirements. The quality of river water depends on the quantity of waste discharged by upstream sources, and the volume flow of the river. Lakes and ponds generally have better, more uniform quality than rivers. An impoundment reservoir is an ideal source of potable water, requiring a minimum amount of treatment. Water harvesting uses catchment basins to collect runoff from precipitation and stores it in tanks designed to prevent seepage and evaporation losses. Groundwater is an important source, constituting about 97 percent of all freshwater. Minimal or no treatment is required and availability is relatively unaffected by droughts. An aquifer stores and transmits ground water in porous strata. If the pumping rate of a well penetrating an aquifer exceeds the recharge rate, the safe yield of the aquifer may be exceeded. In such cases, artificial recharge should be used. Springs water is usually free from bacteria or other harmful substances. Springs, like water wells, are of two types, gravity and artesians. The yields of gravity springs may be increased by constructing deep galleries across the direction of flow. (Purdin-NWWA)

WATER WELL MARKETS IN 1979,
E. A. Scott, Jr.
Ground Water Age, Vol. 13, No. 5, p 20, 27, 28, January, 1979.

Descriptors: *Economic prediction, *Water wells, Industrial production, Drilling, Marketing.

An economic forecast for key water well markets in 1979 is presented. Due to the cost of mortgage money, there will be a slight decline in new residential work, but to a far less extent than in similar periods in the past. Much of the slack caused by a decline in new residential jobs will be taken up by an expansion of the nonresidential market. This is due to an increase in the physical volume of commercial buildings and a trend toward the greater use of ground water in such construction. Water systems replacements will continue to grow during 1979. However, the rate at which pump replacements are growing may be slowing down due to more reliable equipment such as submersibles. New markets for the water well industry, most notably the ground-water source heat pump, will see further development in 1979. 1979 should be a banner year for the water well industry. (Purdin-NWWA)
W79-06017

DRILLERS AND INDUSTRY LEADERS LOOK AT 1979.
Ground Water Age, Vol. 13, No. 5, p 17-21, January, 1976. 1 tab.

Descriptors: *Economic prediction, *Surveys, *Drilling, Water wells.

The results of a survey of the economic outlook of 300 water well drilling contractors are presented in tabular and narrative form. The fourteen economic indices surveyed were: inflation, unemployment, gross income, net income, essential capital expenditures, discretionary capital expenditures, total expenses, administrative expenses, payroll expenses, total personnel, sales area personnel, technical personnel, and promotion. The opinions on the fourteen indices were in three categories: up over 1978, down from 1978, and little or no change. The contractors also gave verbatim reasons for their economic views. The most representative of these statements are presented for each of the fourteen indices. The overall opinion is that 1979 will be a good year for the water well drilling industry in spite of higher inflation and unemployment. (Purdin-NWWA)

AN ANNOTATED BIBLIOGRAPHY ON RIVER RECREATION.
North Central Forest Experiment Station, St. Paul, MN.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 689, Price codes: A04 in paper copy, A01 in microfiche. General Technical Report No NC-41, 1978. Compiled by Anderson, D. H., Leatherberry, E. C., and Lime, D. W. 64 p.

Descriptors: *Recreation, *Rivers, *Wild River Act, *Water resources development, *Bibliographies, Abstracts, Publications, Water sports, Access routes, Natural resources, Social aspects, Social impact, Wild rivers, Campsites, Recreational demand, Recreation facilities, Scenery, Tourism, Economics.

A compilation of available reference materials consisting of more than 300 listings which document various aspects of river recreation is presented. The bibliography is organized in nine parts; in each part the papers are arranged alphabetically according to author. All references are numbered since many references are cited in more than one part. The annotation of a reference appears in the first appropriate citation and subsequent citations are referenced by number at the beginning of all other relevant sections. Part 1 covers material pertinent to water resource management and research; Part 2 includes references on the role of river resources in outdoor recreation; Part 3 presents methods to inventory and classify river recreation resources; Part 4 cites economic methods to evaluate alternative uses of river resources; Part 5 presents articles describing investigations of the impacts people and recreational activity have on river resources; Part 6 focuses on how and by whom the river is used; Part 7 cites management of river resources; Part 8 contains an unannotated listing of all Federal legislation pertaining to the National Wild and Scenic Rivers Act of 1968; and Part 9 is an unannotated listing of selected guidebooks on rivers of North America. An author index is provided at the end of the bibliography. (Davison-IPA)

GEOGRAPHIC-ECONOMIC ASPECTS OF POLLUTION CONTROL SYSTEMS,
Ohio State Univ., Columbus. Dept. of Geography.
C. ZumBrunnen.
In: American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management. Kharkov and Rostov-on-Don, USSR, December 9-16, 1975. Environmental Research Laboratory, U.S. Environmental Protection Agency, Gulf Breeze, Fla., p 155-174 (Discussion p 175-179), September 1978. EPA-600/9-78-024. 4 fig, 21 ref.

Descriptors: *Water pollution control, *Geographic-economic aspects, *Territorial size, *Jurisdictional scale, *Water management(Applied), Optimization, Political aspects, Legal aspects, Cost-benefit analysis, Rivers, Lakes, Regions, Evaluation, Cost minimization, Marginal costs, Spatial impact.

This paper examines four considerations (questions) involved with water pollution. The first deals with the geographic-economic distribution or equity problems arising from either water pollution-generating activities or water pollution control problems; an attempt is made to apply benefit-cost concepts within a spatial context. The second section considers the issue of whether the mere territorial size or jurisdictional scale of a pollution control system enhances or impedes progress in achieving its abatement objectives. In other words, what are the inherent pros and cons associated with pollution control regions at various geographical scales. Investigated are the utility and disutility of the various scales of two types of water quality control regions, namely, political-administrative jurisdictions and natural regions such as river and lake basins. The third section briefly evaluates four broad strategies for water resource management: (a) moral suasion; (b) bargaining; (c) government regulation; and (d) economic inducments. Both of the last two water pollution control strategies are predicated upon governmental legislative action, but the latter is presumed to involve more decentralized decision making. Finally, current U.S. pollution control policies are reviewed. The paper addresses itself to legal, territorial, and economic strategies. Two implicit assumptions are: (1) the true price or value of pure water may be greater than both the U.S. and the USSR have assumed; and (2) the objective of any pollution control system should be to minimize the total costs of residual disposal which is achieved by equating the marginal costs of abatement and the marginal costs of pollution damages. 6C. Cost Allocation, Cost Sharing, Pricing/Repayment

THE USE OF EFFLUENT FEES TO REGULATE PUBLIC SECTOR SOURCES OF POLLUTION,
Princeton Univ., NJ. Dept. of Economics.
W. E. Oates, and D. L. Strassmann.
Journal of Environmental Economics and Management, Vol. 5, No. 3, p 283-291, September 1978. 2 fig, 14 ref.

Descriptors: *Economics, *Pollution taxes(Charges), *Regulation, *Public sector, *Pollution abatement, *Institutional constraints, Institutions, Bureaucracy, Federal government, Treatment plants, Municipal wastes, Powerplants, Weapons production, Costs, Optimization, Motivation, Incentives, Decision making, Financing, Budgeting, Policy, Niskanen model, Water pollution sources, Water pollution control, Effluents, Air pollution, Sewage disposal, Pollutants.

Pollution charges might induce public agencies to control and even reduce the amount of pollutants they introduce to the environment. Even though public agencies are organized on a non-profit basis and effluent charges assume profit-maximizing behavior by polluters, the nature of the budgeting/appropriations process in a bureaucracy makes this a feasible alternative. The analysis employs extended versions of the Niskanen model of bureaucratic behavior to determine the likely response of bureaucrats to effluent fees. Imposition of an effluent fee on a public agency can result in various outcomes: (1) the agency can request and receive a budgetary supplement from the legislature to cover the tax bill, and the pollution level will be unchanged; (2) the agency may be refused the supplement since it is presumably already receiving its maximum allocation, and it will be forced to reduce its level of pollution to meet costs; or (3) the agency may be granted the supplement but still have an incentive to shift less-polluting technology in order to increase prerequisites. This last possibility may be nullified, however, if there is a propensity to avoid the effort and complications of adopting new technology. All evidence shows public agencies to be major sources of pollution, including sewage, sulfur from power plants, and disposal of weapons production by-products. (Lynch-Wisconsin)

LOCATIONAL PRICING OF AN ENVIRONMENTAL INPUT,
Kansas Univ., Lawrence. Dept. of Economics.
K. Unger.
Journal of Environmental Economics, and Management, Vol. 5, No. 3, p 207-219, September 1978. 15 ref.

Descriptors: *Economics, *Effluents, *Water pollution sources, *Pricing, *Mathematical models, *Spatial distribution, Input-output analysis, Model studies, Rivers, Water quality standards, Industrial wastes, Municipal wastes, Policy, Externalities, Sites.

A model describes joint production of outputs and heterogeneous effluents for firms located along a river. Most analyses of externalities associated with joint use of an environmental input have been in spaceless economies in which all production and consumption are assumed to occur at a single site, and water quality, benefits, and costs are measured. That approach obscures the spatial nature of the supply of some environmental inputs. The location-specific pollution model is a water quality study for a fixed and finite number of firms or municipalities along a river. This study considers effluents heterogeneous, unlike most other models which reduce all effluents to biochemical oxygen demand. In the present analysis location-specific water quality standards are derived which reflect that upstream discharges impact strongly on downstream water users. Depending on the type of sequential firm interdependence, a water control agency may or may not be able to insure efficient input choices by decentralizing these choices to the firms. Under certain conditions, site-specific prices can be derived to reflect the socially imputed value of a particular type of effluent released at a given site. If each firm is assigned responsibility for cumulative water quality just below its drain pipe, then water quality control may be modelled as an application of nonsymmetrical recursive decision-making. THE MICROECONOMICS OF WATER SUPPLY AND DEMAND IN THE NORTHEASTERN UNITED STATES,
Pennsylvania State Univ., University Park. Dept. of Economics.
T. McHugh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 642, Price codes: A08 in paper copy, A01 in microfiche. Doctor of Philosophy dissertation, March 1979, 164 p, 8 fig, 16 tab, 59 ref, 4 append. OWRT C-3119 (No. 3688)(2), 14-31-0001-3688.

Descriptors: *Water supply, *Water demand, *Operating costs, Water rates, Model studies, *Pricing policy.

The main purpose was to develop a model of the essential operating characteristics of a water utility in the Northeastern United States. Past studies of the industry have tended to look at either the demand or the supply side--but not both. The 'model' utility was statistically estimated first by estimating demand and cost functions independently of one another and alternatively as a set of simultaneous equations. Data for the estimation process was provided by personal visits to each of the sample water suppliers and conducting in-depth interviews as part of a larger project involving all aspects of water supply and demand in the Northeast. The initial demand and cost functions obtained through independent estimating techniques (Ordinary Least Squares) lent credence to the simultaneous equation model in which the quantity purchased by residential customers, utility operating costs, and water price are viewed as being determined jointly within the system. The equations are then utilized to examine the effects of a change in pricing policy by the 'model' water suppliers on utility costs and revenues. (Sink-Penn State)

6D. Water Demand

GROUND-WATER CONDITIONS IN THE NAVAJO SANDSTONE IN THE CENTRAL VIRGIN RIVER BASIN, UTAH,
Geological Survey, Salt Lake City, UT. Water Resources Div.
R. M. Cordova.
Utah Department of Natural Resources Technical Publication No. 61, 1978. 66 p, 15 fig, 3 plates, 8 tab, 15 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Well data, *Water yield, *Water quality, Pumping, Drawdown, Groundwater recharge, Hydrogeology, Water level fluctuations, Surface-groundwater relationships, Groundwater availability, Water supply, Water demand, Chemical analysis, Utah, *Virgin River basin, Navajo Sandstone.

The central Virgin River basin, Utah, includes about 1,000 square miles in the drainage basin of the Virgin River downstream from the Hurricane Cliffs. the Navajo Sandstone of Late Traiassic and Jurassic age crops out in 234 miles of the basin and underlies younger rocks in about 450 square miles of the basin. Interpretation of data were confined to the area of outcrop of the Navajo. Lithologically the formation is essentially a quartzose sandstone, about 2,000 feet in maximum thickness. Recharge to the Navajo Sandstone is estimated for 1974 to be a minimum of 17,000 acre-feet. Movement of ground water is generally from the Pine Valley Mountains, Bull Valley Mountains, and the area east of the Hurricane Cliffs toward the Virgin River and its tributaries. The overall direction of ground-water movement is independent of the strike or plunge of the large structural features. Discharge of ground water in 1974 amounted to a minimum of 19,000 acre-feet. The average effective porosity in the saturated zone is estimated to be 17 percent. The hydraulic conductivity has an average value of 2.1 feet per day based on laboratory analysis and 5 feet per day based on field tests. The maximum amount of water in storage available to wells is estimated to be 2.8 million acre-feet. Chemical analysis of the water in storage indicates that the concentration of dissolved solids range from 103 to 1,360 mg/L. (Woodard-USGS)

6E. Water Law and Institutions

CALIFORNIA GROUNDWATER REPORT: IT'S FINALLY IN,
P. Call.
Pacific Ground Water Digest, Vol 2, No 3, p 17-19, March, 1979.

Descriptors: *Water law, *Water rights, *Legal review, Groundwater mining, Overdrafts, Water management(Applied), Water wells, Storage, Groundwater recharge, Judicial decisions, Legislation, Law enforcement, California.

The first comprehensive review of California water rights law since 1912 was completed by a commission consisting of university professors, water rights attorneys and former state legislators. The commission recommended a comprehensive groundwater management program enforced by state or local agencies. Overdrafts in some basins should be remedied by natural or artificial recharge and reducing the number of new wells drilled. The commission recommended clarification and streamlining of the groundwater adjudication process. The most controversial area of proposed legislation is the groundwater management section, due to enforcing powers which will be given to local managing districts. If passed, these new laws will have some effect on every area of California but especially on unregulated areas with overdraft problems. (Purdin-NWWA)

SOME COMPLICATIONS IN THE MEASUREMENT OF ENVIRONMENTAL CONTROL IMPACTS: A CASE STUDY OF WATER POLLUTION CONTROLS,
Harvard Univ., Boston, MA. Graduate School of Business Administration.
R. A. Leone.
Socio-Economic Planning Sciences, Vol 12, No 3, p 103-111, 1978. 5 fig, 5 tab, 5 ref.

Descriptors: *Water pollution control, *Regulation, *Industrial production, *Costs, *Economic impact, *Alternative planning, Theoretical analysis, Economics, Measurement, Industries, Governments, Pollution abatement, Alternative costs, Prices, Policy, Textiles, Pulp and paper industry, Oil industry, Metal finishing industry, Technology, Welfare(Economics), Discount rates, Management.

The impact on industry of environmental control regulations is defined as: (1) production cost changes induced by a policy action (primary impacts), and (2) competitive and distributional consequences of those cost changes (secondary impacts). Several complications arise in measuring primary impacts, including: (1) intertemporal and spatial variations in factor prices, (2) the discounting procedure cannot by itself account for future technological options, (3) managements may respond to regulations by reorganizing their operations, and (4) changes in processes or product mix. This paper focuses on water pollution control, but the discussion applies to almost any externally-induced and dicontinuous change in factor costs. Some problems addressed are: estimation of industry cost curves, economic criteria for identifying technical alternatives to be included in engineering studies of regulatory impact, choice of minimum cost abatement methods, sensitivity of findings to factor price changes, managerial criteria for selection of control methods, intra-industry disaggregation of impacts, and dynamic economic process of adjustment to controls. Methods demonstrated are microanalytical; examples include the textile, pulp and paper, petroleum refining, and metal finishing industries. Social questions regarding regulation effectiveness are not examined. Future costs incurred by industry from regulation will probably be lower than at present because of technical change and factor substitution. (Lynch-Wisconsin)

LEGAL ASPECTS OF FLOOD PLAIN MANAGEMENT,
North Carolina Univ. at Chapel Hill. Inst. of Government.
W. A. Campbell, and M. S. Heath, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 639, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Institute, University of North Carolina, Raleigh. Report No. 137, February 1979, 49 p. OWRT B-109-NC(1). 14-34-0001-8104.

Descriptors: *Flood plain management, Floodway, Droughts, Flood insurance, Flood protection, Land use, Legal aspects.

The federal flood insurance program has made it possible for landowners in flood hazard areas to obtain subsidized insurance protection against flood damages. As a condition of this protection, however, the local governments in which flood-prone land is located must adopt various restrictions on the use of land in the floodway and flood hazard areas. The North Carolina legislative center piece for authorizing local flood plain regulations is the Floodway Act. This act is deficient both in terminology and in scope of coverage when examined in the light of the federal requirements. To remedy these deficiencies it is recommended that the Act's coverage be broadened to include flood hazard areas beyond the floodway, to include areas of coastal flooding, and to delete the uses permitted as of right in the floodway. It is important for the state to play a major coordination and advisory role in land use regulation for flood protection. Local governments need technical assistance in preparing and administering the necessary regulatory measures, and the state has an important role to play in coordinating local efforts with the Federal Insurance Administrator and in generally overseeing the program. In addition, state property must meet the federal requirements in order for the state to obtain insurance or to qualify as a self insurer. Statutory changes are suggested to meet these needs. (Kiger-North Carolina)
W79-06049

SOUTHEAST CONFERENCE ON LEGAL AND ADMINISTRATIVE SYSTEMS FOR WATER ALLOCATION AND MANAGEMENT, VIRGINIA POLYTECHNIC INSTITUTE AND STATE UNIVERSITY, BLACKSBURG, APRIL 19-20, 1978.
North Carolina State Univ. at Raleigh. Water Resources Research Inst.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 646, Price codes: A04 in paper copy, A01 in microfiche. Summary Report, Vol 1, No 1, 1978. 66 p. OWRT B-123-NC(1) and B-125-NC(1). 14-34-0001-9144, 14-34-0001-8134.

Descriptors: Water law, Water rights, Water administration, Water allocation, Land use, Interbasin transfer.

Conference objectives were: (1) to identify present and anticipated water allocation, use, and management problems in the Southeast as related to the present riparian reasonable use doctrine, (2) to analyze the adequacy of existing water law and administrative systems to cope with these problems, (3) to establish commonality of problems for sharing experiences and for identifying promising new legal and administrative approaches and research needs, and (4) to develop a responsive re-

gional action program. Water law and administration problems in Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina, Tennessee, and Virginia are discussed. Individual state summaries, conclusions, and recommendations are included. An overall regional summary includes recommendations for: a restudy of existing legal and administrative systems; clarification of water rights associated with non-riparian diversion and interbasin transfer; codification and recodification of state water law; improved state law and policies with respect to minimum streamflows, water shortages, hydrologic relationships between surface and groundwater, and land use relationships.
W79-06051

RURAL WATER AND SEWER SYSTEMS PROBLEMS, NEEDS, ISSUES, OPPORTUNITIES, AND GOALS,
National Rural Water Association, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-278 986, Price codes: A03 in paper copy, A01 in microfiche. Report No. EDA-065, August 1976. Proceedings, First National Organizational Conference of the National Rural Water Association, Oklahoma City, OK, April 15-16, 1976, 46 p.

Descriptors: *Water supply, *Water supply development, *Sewerage, *Financing, Sewage treatment, Legal aspects, Water pollution, Water treatment, Rural areas, Community development, Area redevelopment, Investment, Government finance, Maintenance, Management, Operation and maintenance, Technology.

The goals, problems and issues of rural water systems are set forth as defined by representatives of eight State Rural Water Associations, the organization meeting in Oklahoma City. The problems and issues of rural water supply and sewage systems are broadly categorized as financial, legal and jurisdictional, technological, operational and administrative, and educational and informational. The discussion includes analyses of the financial, jurisdictional and legal aspects, and system design, management, operation and maintenance. It is concluded that the socioeconomic and intergovernmental implications of both existing systems and demands for additional systems must be addressed, and that substantial public and private investments will be required during the next few years to meet the water and sewer needs in the rural areas and small towns of America. (Davison-IPA)

LAND AND WATER RESOURCES CONSERVATION ACT OF 1977,
Hearings, Subcommittee on Conservation and Credit, Committee on Agriculture, U.S. House of Representatives, on H. R. 75, March 1, 1977, Serial No. 95-U, 44 p.

Descriptors: *Conservation, *Land management, *Water conservation, *Legislation, Land resources, Land use, Water demand, Water management(Applied), Water pollution, Water quality, Water resources, Water policy.

This hearing before the U.S. House of Representatives Subcommittee on Conservation and Credit of the House Committee on Agriculture addresses the Land and Water Resources Conservation Act of 1977. In order to further the conservation of land, water, and related resources this act states the congressional policy that the conduct of programs administered by the Secretary of Agriculture for this purpose should be responsive to the long-term needs of the nation. This policy is to be implemented by: (1) appraising on a continuing basis the land, water and related resources of the nation; (2) developing and updating periodically a program for furthering the conservation, protection and enhancement of the land, water and related resources of the nation; and (3) providing to Congress and the public, through continuing reports, the information developed pursuant to paragraphs (1) and (2) as stated above, and by providing Congress with an annual evaluation report. Appearing before the subcommittee were representatives of: the Sierra Club; the National Association of Conservation Districts; the Soil Conservation Society of America; and the National Wildlife Federation. All verbatim testimony is included. (Goldberg-Florida)

NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION ORGANIC ACT.
Hearings, Committee on Commerce, Science, and Transportation, U.S. Senate, on S. 2224, April 6, 1978, Serial No. 95-88, 81 p.

Descriptors: *Oceans, *Legislation, *Planning, *Priorities, Atmosphere, Political aspects, Coastal engineering, Coasts, Water resources development, Water policy, Environmental effects.

The hearing before the United States Senate Committee on Commerce, Science, and Transportation addressed Senate Bill 2224. The purpose of this bill is to establish a national ocean policy and to set forth the missions of the National Oceanic and Atmospheric Administration (NOAA). The bill designates the NOAA as the lead civilian agency with responsibility for coordinating and carrying out national ocean policy in order to improve the understanding, assessment, development, utilization, conservation and protection of ocean and coastal resources and the atmosphere. The bill states the Congressional policy that the federal government utilizes its capabilities to create and maintain conditions under which ocean, coastal, and atmospheric resources may be utilized without harming the environment so as to fulfill the needs of present and future generations. Also contemplated is the efficient dissemination of atmospheric and oceanographic research and technology to the states, local governments and the private sectors as well as other federal agencies. All testimony received by the committee is reproduced verbatim. (Goldberg-Florida)
W79-06294

WETLANDS PROTECTION: THE REGULATORY ROLE OF THE UNITED STATES ARMY CORPS OF ENGINEERS,
L. D. Wood, and J. R. Hell, Jr.
Coastal Zone Management Journal, Vol. 4, p 371-404, 1978.

Descriptors: *Wetlands, *Regulation, *Land development, *Engineering, Permits, Dredging, Marshes, Swamps, Coasts, Estuaries, Judicial decisions, Planning.

Until recently, people ascribed little value to marshy lands that could not be farmed or otherwise developed. However, modern science has demonstrated the great importance of wetlands, in both environmental and economic terms. These valuable functions are discussed briefly. The U.S. Army Corps of Engineers administers the only nationwide regulatory program that controls development activities in United States waters and wetlands. The program regulates the issuance of permits to private parties for activities involving wetlands property. The statutory authorities, jurisdictional limitations, and evolution of the current corps regulations, which express a strong policy to protect wetlands, estuaries, and tidal waters from unnecessary dredging, filling, or other alterations are examined. The organization and procedures of the Corps of Engineers are explained and several important permit cases which have developed and implemented the Corps' wetlands policy are also detailed. Current and potential policies underlying the Corps' regulatory efforts are evaluated. The author concludes that the wisest policy for now is to permit alteration of wetlands only when that is clearly necessary to attain public benefits which cannot be attained otherwise. (Horwich-Florida)

INTERGOVERNMENTAL COMPLEXITY AND COASTAL ZONE MANAGEMENT,
New York Univ., NY. Graduate School of Public Administration.
R. L. Sparrow.
Coastal Zone Management Journal, Vol. 4, No. 4, p 363-70, 1978.

Descriptors: *Governmental interrelations, *Coasts, *Planning, *Political aspects, Management, Government finance, Shore protection, Federal jurisdiction, State governments, Local governments, Federal government, Priorities.

The primary purpose of the Coastal Zone Management Act of 1972 (CZMA) and its substantial amendments of 1976, is to initiate coastal zone management practices by means of stimulating state and local activity. Political scientists and political decision-makers have long recognized the difficulty in a federal system of determining the most appropriate jurisdictional level for a given policy activity. The CZMA, straddles the fence regarding the centralization-decentralization jurisdictional dispute. The consequence of this pattern of dispersal of authority will be relative inattention to long-term considerations, such as conservation and preservation. The potential for conflict over the use of the coastal zone is increasing. The basic difficulty is that the law itself is inconsistent in providing for the promotion of goals which are esentially conflicting. Since the problems that engender conflict in this area will not diminish in coming decades, and since the disputants include governmental as well as private forces, the likelihood exists for greater federal involvement whenever the level of conflict exceeds the bounds of existing, decentralized procedures. COMPLYING WITH THE FLOOD DISASTER PROTECTION ACT,
Pennsylvania State Univ., State College.
B. L. Myers, and J. K. Ruben.
Real Estate Law Journal, Vol. 7, No. 2, p 114-131, 1978.

Descriptors: *Flood plains, *Flood plain zoning, *Flood plain insurance, *Local governments, Legislation, Flood control, Federal government, Regulation, Construction, Land use, Land development.

The most significant aspect of the National Flood Insurance Program contained in the Flood Disaster Protection Act of 1973 (Act) is that, if stringent land use controls are not enacted by local or state governments for flood-prone areas, no flood insurance will be made available to residents of such communities. In addition, no money for property acquisition, construction, or development from federal agencies will be made available in the designated 100-year flood plain. In order for individuals to benefit from this program their community must first become an 'eligible community' by complying with federal Housing and Urban Development codes and ordinances. Though no overt sanctions were included in the program, the lack of availability of flood insurance, as well as the withholding of certain federal funds, were expected to encourage compliance with the Act. Amendments are currently being considered which would mean effectively imposed sanctions on those individuals who do not comply with the Act while elminating sanctions against those where are in compliance. (Goldberg-Florida)

THE RESPONSES OF THE LEGAL SYSTEM TO TECHNOLOGICAL INNOVATION IN AQUACULTURE: A COMPARATIVE STUDY OF MARICULTURE LEGISLATION IN CALIFORNIA, FLORIDA AND MAINE,
Massachusetts Inst. of Tech., Cambridge.
S. Owen.
Coastal Zone Management Journal, Vol. 4, No. 3, p 269-94, 1978.

Descriptors: *Aquaculture, *Legislation, *Leases, *Technology, Marine animals, Marine plants, Coasts, Cultivation, Competing uses, Florida, California, Maine.

Aquaculture has been defined as the culture or husbandry of aquatic animals or plants for commercial purposes or to augment natural stocks. Salt-water aquaculture (mariculture) legislation in most states restricts the leasing of coastal waters for specific, existing technologies. Legal responses to innovations has been cautious and piecemeal. But legislation in California, Florida, and Maine represents a more flexible approach to accommodating new technologies. These states' legislation is broadly drafted, and provides for the leasing of coastal areas and use of the vertical water column for any type of aquaculture activity. While this represents a policy decision which would appear to encourage future innovation, the author examines the implications of such a policy and warns that there are a number of complex issues to be resolved in order for states to achieve the desired results. The failure of these states to respond fully to these issues may inhibit aquaculture innovation or unduly restrict nonaquaculture uses of the coastal zone. For example, the effects of minimum time periods or maximum tract sizes of leases are discussed, as are legislative drafting problems and rights of conflicting interest groups. (Horwich-Florida)

OLD WOMAN CREEK, OHIO: THE DESIGNATION OF A FRESHWATER ESTUARINE SANCTUARY,
Ohio Dept. of Natural Resources, Columbus.
D. P. Hanselmann, and T. L. Vogel.
Coastal Zone Management Journal, Vol 4, No 3, p 329-35, 1978. 2 fig.

Descriptors: *Estuaries, *Great Lakes region, *Coastal marshes, *Ohio, Beaches, Marshes, Administrative agencies, Administrative decisions, Estuarine environment, Great Lakes, Freshwater marshes, Preservation.

Although much of Ohio's Lake Erie shoreline is highly developed, one section is a relatively undisturbed representative of freshwater estuaries found around the Great Lakes. This section is located at the mouth of Old Woman Creek in Erie County. In 1975, the Ohio Department of Natural Resources (ODNR) applied to the federal Office of Coastal Zone Management (OCZM) for an estuarine sanctuary grant. The purpose of such a sanctuary is to ensure the long-term protection of a freshwater estuary for the study of both the natural relationships within the ecosystem and of human impact, and for public education programs that emphasize the value of estuaries. The proposed 637-acre sanctuary is comprised of four general landscape types: marshland, woodlands, open fields, and a barrier beach. Development of sound management plants is essential to the long-term scientific/interpretational use and protection of the proposed estuarine sanctuary. The agency submitting the grant application should realize: the need to involve all affected and interested parties at an early planning stage; that the grant process may be a lengthy one; and that compromises and plan modifications may be necessary in boundaries and management plans. (Fortin-Florida)

THE EXCLUSIVE ECONOMIC ZONE AS A CONCEPT IN INTERNATIONAL LAW,
J. C. Phillips.
International & Comparative Law Quarterly, Vol. 26, No. 3, p 585-618, July, 1977.

Descriptors: *United Nations, *Conferences, *International waters, *International law, Oceans, Economics, Fish conservation, Shore protection, Environmental control, Continental shelf, Boundaries(Surfaces), Beds under water.

The Third United Nations Conference on the Law of the Sea was characterized by the failure of the international community to agree on any precise legal regime for the oceans. One of the suggestions that was regarded as likely to form a basis of agreement was the concept of the exclusive economic zone. An exclusive economic zone has been defined as an area beyond and adjacent to the territorial sea in which a State has sovereign rights for the purpose of exploring, exploiting, conserving and managing the natural resources, whether renewable or non-renewable, of the bed, subsoil and superadjacent waters. The sovereign rights of the coastal state pertain only to the resources of the zone rather than the zone itself. Problems that attend such a concept are: (1) the difficulty of delimiting the zone between adjacent states; (2) whether small islands should be entitled to an economic zone of their own; and (3) whether the jurisdiction of coastal states is far too extensive in regard to control over fishing resources as to control over which countries may fish in its economic zone. (Goldberg-Florida)

ECONOMIC IMPACT ANALYSIS OF A TRIHALOMETHANE REGULATION FOR DRINKING WATER. MCL OF THM AT 0.10 MILLIGRAMS/LITER FOR LARGE WATER SYSTEMS.
Temple Barker and Sloane, Inc., Wellesley Hills, MA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 813, Price codes: A07 in paper copy, A01 in microfiche. Report August 1977. 124 p, 6 fig, 52 tab, 4 append.

Descriptors: *Economic impact, *Water quality standards, *Organic compounds, *Water quality control, *Analytical techniques, Cost analysis, Costs, Water treatment, Human population, Treatment facilities, Regulation, Monitoring.

An analysis considered the economic impacts of reducing the maximum contaminant level (MCL) of trihalomethanes in potable water to 0.10 mg/liter at treatment plants serving 75,000 people. The regulation proposed would also require plants serving 10,000-75,000 people. The regulation proposed would also require plantsserving 10,000-75,000 people to monitor trihalomethane levels. The analytic structure identifies regulatory criteria, the number of community water systems affected by the regulation, the available treatment alternatives, and a profile of systems' response to MCL regulation. Cost analyses of the regulation include national cost estimtes, costs to typical systems, and monitoring costs. Variables considered in the economic analysis include varying the mix of treatments which systems would select, varying the MCL, and including system size boundaries above and below the 75,000 population mark. The impacts on the industries supplying granular activated carbon, regeneration furnaces, chlorine dioxide, ozonators, and ammonia for treatment of water under the proposed regulation are also considered. Appendices provide methodology and modelling procedures, water quality data, treatment costs and sensitivity analysis, and regulatory compliance strategies. (Lisk-FIRL)

THE IMPACT OF COMPOSITE SAMPLING AND OTHER DATA AGGREGATION PROCEDURES ON POLLUTION DETECTION IN THE PULP AND PAPER INDUSTRY,
British Columbia Univ., Vancouver.
H. D. Drechsler, and P. N. Nemetz.
Canadian Journal of Forest Research, Vol. 8, No. 3, p 328-340, September, 1978. 9 fig, 11 ref, 45 tab.

Descriptors: *Pulp and paper industry, *Water pollution, *Sampling, Water pollution sources, Canada, Foreign countries, Monitoring, Data collections, Effluents, Discharge(Water), British Columbia(Canada).

The inadequacy of current procedures for the measurement and analysis of effluent data are demonstrated. The deficiencies of these procedures are illustrated using as an example the British Columbia pulp and paper industry. Four factors have been identified which restrict the ability of various monitoring systems to detect the presence and severity of excessive effluent discharges. These factors are the significant information losses associated with current grab and composite sampling techniques, the units of measurement presently required for the assessment of effluent quality, the infrequency of compliance monitoring, and information losses associated with statistical aggregation procedures used in the compilation and analysis of effluent data. TV INSPECTION LOCATES LIBYAN WATER WELL PROBLEMS,
Underground Surveys Corp., Fresno, CA.
R. DeLenikos.
Irrigation Journal, Vol 29, No 1, p 31, January-February, 1979.

Descriptors: *Water wells, *Inspection, Irrigation, Equipment, Well screens, Sands, Separators, Pumps, Telemetry, Rehabilitation, Downhole cameras.

Over 200 irrigation wells serving a large agricultural area in Libya were quickly and accurately inspected with a down-hole television system specially prepared for desert transport. The television survey revealed that most of the performations were plugged with mud while the remaining perforations were causing high entrance velocities and forcing in the sand. An eight inch stainless steel well screen with a sixteen inch production casing was installed and a separator was installed on the pump discharge to reduce the sand content. (Purdin-NWWA)

MEASURING FLUMES OF SIMPLIFIED CONSTRUCTION,

Science and Education Administration, Phoenix, AZ. Water Conservation Lab.
J. A. Replogle, and A. J. Clemmens.
Paper No. 78-2506, Presented at the 1978 Winter Meeting of the American Society of Agricultural Engineers, December 18-20, 1978, Chicago, IL. 13 p. 10 fig, 3 tab, 15 ref. ASAE, St. Joseph, Michigan.

Descriptors: Flumes, Measurement, Mathematical models, Flow measurement, Irrigation canals, Critical flow, Construction costs.

Mathematical modeling was applied to optimize error control and construction simplicity for the selection of a family of long-throated flumes, resembling broad-crested weirs with a sloping approach ramp, for use in trapezoidal irrigation canals. Alternate shapes and sizes were proposed for unlined canals with extensions to sizes and shapes for limited application to watershed work. (Skogerboe-Colorado State)

HF SURFACE-CURRENT MAPPING RADAR 1977 ALASKAN OPERATIONS--LOWER COOK INLET,
National Oceanic and Atmospheric Administration, Boulder, CO. Wave Propagation Lab.
D. E. Barrick.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol IX, Transport, p 1-20, October 1978. 14 fig. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Mapping, *Circulation, *Ocean currents, *Radar, *Baseline studies, Oil spills, Water pollution effects, Environmental effects, Resources development, Alaska, *Outer Continental Shelf, *Oil transport, Cook Inlet.

The objectives of the initial Alaskan experiments in the summer of 1977 were: (1) to demonstrate the feasibility and utility of a transportable HF radar system for operational near-real-time mapping of surface currents in remote coastal areas, and (2) to gather environmental baseline data on surface circulation around Kachemak Bay in the Lower Cook Inlet. By presenting sample radar-produced current maps at two opposing periods in the tidal cycle and comparing these data with drifter buoy velocity measurements, the credibility of the claim is established that such systems can play a major role in future coastal current-data gathering studies. Results show that: (1) a single current-vector map covering thousands of square kilometers can be produced after 15 minutes operation; (2) at least three orders of magnitude more data can be gathered in a given twelve-hour period than by any alternative technique; (3) the system rms error is at worst one-half knot (current velocity), and most likely considerably better. (Sinha-OEIS)

OPERATION OF AN ALASKAN FACILITY FOR APPLICATIONS OF REMOTE-SENSING DATA TO OCS STUDIES,
Alaska Univ., Fairbanks. Geophysical Inst.
A. E. Belon.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 260-291, October 1978. 10 fig. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-55.

Descriptors: *Monitoring, *Remote-sensing, *Sea ice, *Oil spills, *Geomorphology, Offshore platforms, Baseline studies, Hazards, Environmental effects, Meteorology, Forecasting, Alaska, *Outer Continental Shelf, Petroleum development, Petroleum transport.

The acquisition of remote-sensing data, especially satellite data, has proved to be a cost-effective method of monitoring the environment on a synoptic scale. Meteorological satellites have been used for over a decade to study weather patterns and as an aid to weather forecasting. The morphology and dynamics of sea-ice which are relevant to navigation and construction of offshore structures, the patterns of sediment transport and sea-surface circulation which will aid to forecast trajectories of potential oil spills and impact on fisheries, the nature of ecosystems in the near-shore regions which can be changed by human activity, are among the critical development-related environmental parameters which can be studied, in conjunction with appropriate field measurements, and eventually routinely monitored by remote-sensing. (Sinha-OEIS)

M. Frank, and G. A. Laursen.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for the Year Ending March 1978, Vol X, Transport, p 835-852, October 1978. 4 fig. NOAA, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Remote sensing, *Radar, *Aircraft, *Oil spills, *Mapping, Sea ice, Baseline studies, Environmental effects, Path of pollutants, Resources development, Water pollution, Alaska, *Outer Continental Shelf, *Oil transport, Side looking airborne radar(SLAR), North Slope(AK), Petroleum development.

The primary objective of the proposed program is to establish, operate and maintain a remote sensing data acquisition system using primarily side looking airborne radar (SLAR), a precision radiation thermometer (PRT-5) and aerial photomapping cameras. The SLAR has been installed into the dedicated NARL aircraft C117-D in a modular configuration. SLAR imagery is easily obtained through most weather conditions. It becomes a potentially important tool for determining the magnitude of an oil spill under sea ice. It can then be used to map the movements of oil slicks as they are moved by currents and winds. The precision radiation thermometer (PRT-5), or remote thermometer, measures the effective emission-surface temperature using broad spectrum infrared. Pointedly, ground, snow surface, water, oil slick and oil seep temperatures can be determined quickly and with a high degree of accuracy. (Sinha-OEIS)

L. M. MacCary.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 508, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 78-88, July 1978. 30 p, 12 fig, 4 tab, 10 ref.

Descriptors: *Logging(Recording), *Borehole geophysics, *Electrical well logging, *Radioactive well logging, Aquifers, Carbonates, Analytical techniques, Aquifer characteristics, Evaluation, Texas, *Edwards aquifer, Well log analysis, Cross plot methods, M and N plots, Pattern recognition methods.

Geophysical logs from two core holes in the Edwards aquifer in Texas were analyzed and the results compared to other geologic and hydrologic data obtained from well tests and core studies. The acoustic velocity, sidewall neutron, and density logs are especially useful in the study of carbonate aquifers because porosity, secondary porosity, rock composition, and bulk density can be determined from them. Under some conditions, deeply focused resistivity logs can be used to calculate formation water resistivity and the cementation exponent. The log analysis methods described can be applied to other carbonate systems by hand plotting and a few simple calculations which can be performed on a pocket calculator. The hydrologist is advised of specific criteria which his logs must meet in order to derive maximum value from the analysis. (Woodard-USGS)

FLOW MEASUREMENT USING A CONDUCTIVITY FLOW METER--INITIAL INVESTIGATION,
Department of Scientific and Industrial Research, Taupo (New Zealand). Ecology Div.
P. H. John, F. A. Johnson, and P. Sutcliffe.
Journal of Hydrology (New Zealand), Vol 17, No 1, p 16-30, 1978. 7 fig, 2 tab, 13 ref.

Descriptors: *Flow, *Flowmeters, *Flow measurement, *Instrumentation, Current meters, Channel flow, Streamflow, Closed conduit flow, Laboratory tests, Tracers, Salts, Sodium compounds, Electrical conductance, Measurement, Velocity, Hydrology, *Conductivity flowmeters.

The limitations of existing salt velocity flow measurement techniques were reviewed, and the use of a new automatic method called the Conductivity Flow Meter was described. During trials in a laboratory flume, the variables associated with the new system were examined to assess their effect on performance, and a series of tests was carried out to investigate the precision and accuracy of the meter. The results showed the Conductivity Flow Meter to compare favorably with other salt-velocity techniques and current meters and indicated that it could find wide application in flow measurement both in closed conduits and open channels. WATER RESOURCES DATA FOR LOUISIANA, WATER YAR 1978--VOLUME 1. CENTRAL AND NORTHERN LOUISIANA.
Geological Survey, Baton Rouge, LA. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-292 412, Price codes: A18 in paper copy, A01 in microfiche. Geological Survey Water-Data Report LA-78-1, December 1978. 412 p, 9 fig.

Descriptors: *Louisiana, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Central and northern Louisiana.

Water resources data for the 1978 water year for Louisiana consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of ground water. The report, in three volumes, contains discharge records for 76 gaging stations; stage records for 66 of these gaging stations; stage only for 32 gaging stations; contents for 1 reservoir; state only for 12 lakes; water quality for 22 gaging stations, 35 ungaged sites, 80 miscellaneous sites, 10 lakes, and 169 wells; and water levels for 696 observation wells. Also included are 199 crest-stage partial-record stations and flood-profile partial-record stations. Additional water data were collected at various sites, not involved in the systematic data-collection program, and are published as miscellaneous measurements. Records for a few pertinent stations in bordering States also are included. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Louisiana. (Woodard-USGS)

This report presents hydrologic, geologic, and water-quality data collected within the Ochlockonee River basin area, in the panhandle of northwest Florida. The data are presented in graphs and tables. Surface-water data include streamflow measurements and analyses of water collected at 58 sites; ground-water data include descriptions of 360 wells and core holes, analyses of water and hydrographs of selected wells, lithologic logs of 131 wells and test borings, and natural-gamma logs of selected wells ranging in depth from 110 to 1,346 feet. Rainfall and municipal pumpage data also are compiled. Maps show the location of the data-collection sites. (Woodard-USGS)

WATER AVAILABILITY, CLEBURNE COUNTY, ALABAMA,
Geological Survey, University, AL. Water Resources Div.
R. V. Chandler, and G. C. Lines.
Alabama Geological Survey Map 143, 1978. 29 p, 9 fig, 4 tab, 21 ref.

Descriptors: *Available water, *Surface waters, *Groundwater resources, *Water quality, Hydrologic budget, Water supply, Maps, Streamflow, Flow rates, Water storage, Lakes, Reservoirs, Aquifers, Water yield, Groundwater availability, Water wells, Hydrogeology, Water analysis, Chemical analysis, *Alabama, *Cleburne County(Ala).

In Cleburne County, Alabama, large quantities of surface water are available from the Tallapoosa and Little Tallapoosa Rivers. The Tallapoosa River near Heflin has an average flow of about 410 Mgal/d (million gallons per day). The Little Tallapoosa River has an average flow of about 300 Mgal/d where it enters the county. Surface water stored in lakes and farm ponds in the county is estimated to be 2,000 million gallons. The principal sources of ground water in the county are saprolite and fractured bedrock. Some wells in the vicinities of Heflin and Chulafinnee may yield 100 gal/min (gallons per minute) or more, but wells in other parts of the county generally yield 25 gal/min or less. Although large quantities of ground water are not available from individual wells, water sufficient for domestic and stock needs generally can be obtained. Water supplies adequate for small towns and light industries can be obtained from wells. Both surface water and ground water generally are of good chemical quality and suitable for most uses. Surface water is soft and low in dissolved-solids content. Ground water is generally soft and low in iron content; however, locally it ranges from moderately hard to very hard and contains more than 0.3 milligram per liter of iron. Total water use in the county in 1969 was about 1.6 Mgal/d, which is less than 1 percent of the water available. (Woodard-USGS)

W LIFE FOR TERMINAL WELLS,
T. Guardino.
ific Groundwater Digest, Vol 2, No 2, p 19-23, ruary, 1979.

scriptors: *Water wells, *Repairing, *Maintece, Equipment, Inspection, Hydraulic equipnt, Rupturing, Well screens, Clogging, Pumping s, Rehabilitation.

ing construction costs, limited availability of ll sites, and environmental protection are three sons for increased interest in water well maintece and rehabilitation. Rehabilitation involves air and/or redevelopment based on information ained from visual inspection with a television . Essential information includes structural con-ion, corrosion, encrustation, screen location, and ation of reducers. The hydraulic sewage or ming tool is used to repair ruptures and overlapg perforations. Clogged screen and perforations be cleaned with a variety of techniques. Each ll should be carefully analyzed prior to employ- any method. Well maintenance includes the ll itself and the pumping unit. The amount and e of maintenance are dependent on the quality the water. Regular treatment of wells which ve encrustation problems will ensure continuous iciency and prolong the well and pump life pectancy. A maintenance program should be termined with pumping tests to establish both mp and well performance, and water quality alyses. Water well drilling contractors would fit most by subcontracting with well maintece and rehabilitation specialists. (Purdin-WWA)

ME SIMPLE SAND SOLUTIONS,
tional Water Well Association Worthington, H.
E. Gass.
ater Well Journal, Vol. 33, No. 3, p 36-37, rch, 1979.

escriptors: *Sand pumping, *Well filters, Well reens, Pipes, Water wells, Well development, ell rehabilitation, Clogging, Erosion.

scharging of sand from wells penetrating layers fine sand causes clogging of pipes and sprinkler igation lines. Coarse grained particles may mage screens and reduce well efficiencies. Sand ssing through the pump erodes pump bowls and pellers, drastically shortening their performance e. Causes of sand pumping include: (1) improper lection of a slot size for the well intake; (2) calized enlargement of slot or screen openings, holes in the casing due to corrosion or abrasion; a broken or defective seal or packer; (4) settling d bridging of the gravel pack, which exposes rts of the natural formation; (5) inadequate well velopment; and (6) decomposition of borehole alls in uncased wells in sandstone aquifers. Solu-ons to the above problems are recommended aring in mind that some cases of sand pumping ay require more complex remedies. Improved sign, construction and well development techques will significantly reduce the incidence of nd problems. Many sandpumping wells can be habilitated to produce clear, sand-free water. urdin-NWWA)

COLLAPSE PRESSURE PREDICTION FOR THERMOPLASTIC WATER WELL CASINGS,
Auburn Univ., AL. Dept. of Civil Engineering.
D. York.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 665, Price codes: A06 in paper copy, A01 in microfiche. MS Thesis, December 1978, 107 p, 14 fig, 3 tab, 39 ref, append. OWRT A-059-ALA(1).

Descriptors: *Well casings, Plastics, Water wells.

This study analytically determined the collapse resistance of thermoplastic water well casings subjected to a linearly varying external pressure. The method used in the analysis was the principle of minimum potential energy, energy of the external loads, and the strain energy of the confining medium surrounding the casing. The collapse pressure prediction equation was developed in terms of casing geometry, external loading conditions, casing material properties, and surrounding soil or grout support. Parametric studies were conducted to evaluate the influence of these parameters on the predicted collapse pressure. Results indicate that the current method used in designing thermoplastic water well casings in some cases underestimates the collapse resistance of the casing.

THE BOTTOMLESS DAM,
Monash Univ., Clayton (Australia).
R. M. Phatarfod.
Journal of Hydrology, Vol. 40, No. 3/4, p337-363, February 1979. 6 tab, 26 ref.

Descriptors: *Dams, *Dam design, *Model studies, Mathematical models, Analytical techniques, Inflow, Storage, Reservoir storage, Discharge(Water), Reservoirs, Reservoir releases, Mathematics, Equations, Markov processes, Boundary processes.

The purpose of the work reported was to show that it is more fruitful to consider the bottomless (infinitely deep) dam as an approximation to the finite dam rather than the topless (infinitely high) dam considered hitherto. It was shown by taking a wide variety of input models that the theory for the former is far simpler, and the final results are in a form simple enough to give a quick estimate of the size of the reservoir required. Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY3, Proceedings Paper 14464, p 257-273, March 1979. 7 fig, 7 ref, 3 append.

Descriptors: *Uplift pressure, *Gravity dams, *Dam design, *Model studies, Mathematical models, Numerical analysis, Dams, Concrete dams, Joints(Connections), Drainage, Seepage, Loads(Forces), Engineering, Civil engineering, *Hollow gravity dams.

Closed-form solutions were obtained with the help of the Schwartz-Christoffel transformation for the determination of uplift pressures on hollow gravity dams. The uplift pressures were calculated numerically from the derived equations and plotted to facilitate the use of the results for design purposes. It was seen that uplift pressures along the joint between two monoliths drop almost linearly from the full-uplift pressure at the upstream face of the dam to zero uplift at the head of the cavity. The uplift along the center line of the monolith drops linearly to about less than 1/3 of the differential head at a point opposite the head of the cavity. Beyond this, the reduction in the uplift pressures was gradual. (Sims-ISWS)

UTILITY DISTRIBUTION SYSTEMS IN ICELAND,
Army Terrestrial Sciences Center, Hanover, NH.
H. W. C. Aamot.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A026 956, Price codes: A04 in paper copy, A01 in microfiche. Special Report, 1976. 63 p, 54 fig.

Descriptors: Foreign countries, Islands, Public utilities, *Water distribution(Applied), Electrical networks, *Sewerage, *Waste water treatment, *Municipal wastes, Pipes, Thermal water.

Reykjavikj's utility systems including water distribution, sewage collection, heat distribution, and electric transmission, are discussed. The sewage system consists of 203 miles of concrete pipes buried 4 ft underground. The lines are laid for gravity flow with outlet into the ocean. A primary treatment system has been proposed at a cost of $10-20 million over ten years. Clean water which needs no chlorination is drawn from wells 15 km east of the city and distributed through cast iron and polyethyelene pipes. The normal maximum water usage is 65,000 cu m/day. The electrical distribution system is described, as is the geothermal district heating and hot water system. (Small-FIRL)

ABATEMENT OF DEPOSITION AND SCOUR IN SEWERS,
Water Resources Engineers, Inc., Walnut Creek, CA.
M. B. Sonnen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 585, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-77-212, 1977. 114 p, 35 fig, 13 tab, 50 ref, 1 append.

Descriptors: *Design, Sewers, *Storm drains, *Combined sewers, Solid wastes, *Mathematical models, Conduits, *Pipe flow, Waste water treatment.

A new methodology is described for analyzing the design of storm and combined sewer systems. A review is presented of feasible methods for reducing the first-flush of solids in overflows from storm and combined sewers. These include increasing conduit slopes, providing cunette sections or other pipe shapes which maintain high velocity during low flow periods, providing upstream capture of solids during high flows, and providing increased treatment downstream. A mathematical model was developed which simulates the behavior of solids in pipelines as bedload, suspended load, or washload. The model is an adaptation of the EPA Storm Water Management Model. Sample analyses are given. The model can be applied to the design of total systems while considering the physical and economic factors of parts of the total system. (Small-FIRL)

EVALUATION OF BACKFLOW PREVENTION DEVICES: A STATE-OF-THE-ART REPORT,
National Bureau of Standards, Washington, DC.
G. C. Sherlin, and R. W. Beausoliel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-260 913, Price codes: A07 in paper copy, A01 in microfiche. Final Report, 1976. 137 p, 5 fig, 20 tab, 38 ref, 1 append.

Descriptors: Potable water, Performance, *Pipe flow, Piping systems(Mechanical), *Flow control, Flow characteristics, *Standards, *Testing, *Reliability.

The state-of-the-art of backflow prevention devices was reviewed. A systematic review of the literature is presented along with reports of consultations with water purveyors, plumbing officials, laboratory officials, and field researchers. Effective devices, test methods, and laboratory practices are considered. Existing backflow prevention devices provide protection against backflow, however not enough data exists to quantitatively establish effectiveness. None of the existing devices is fool proof. A. S. S. E. Standards are the only standards that have definitive test procedures and test setups. The test methods could be improved by the use of realistic service condition simulation. Tests on the reliability of devices, functional performance tests, and development of a fail-safe indicator are recommended. (Small-FIRL)

SOLAR IRRIGATION PROGRAM - STATUS REPORT, OCTOBER 1976 THROUGH JANUARY 1977,
Sandia Lab., Albuquerque, NM.
R. L. Alvis.
Available from the National Technical Information Service, Springfield, VA 22161 as SAND-77-0380, Price codes: A04 in paper copy, A01 in microfiche. Report SAND-77-0380, 1977. 66 p, 43 fig, 11 ref.

Descriptors: *Irrigation, Irrigation engineering, *Costs, *Energy, Performance, *Pump testing, Deep wells, New Mexico, Arizona, *Heat transfer.

Progress made by the ERDA solar irrigation program from October 1976 through January 1977, is discussed. The program, which initially consisted of a shallow well experiment under construction in NM, has been expanded to include a deep well experiment in AZ and a follow up demonstration system. Technical discussion of the shallow well experiment is emphasized. The solar collector field, 6710 sq ft aperture area, heats a heat transfer fluid (Exxon Caloria HT 43). When the heat transfer fluid exits the collector field, it is recirculated if its temperature is below 420F. If above 420F, the fluid is sent either to the heat engine or thermal storage. The heat engine either takes heated oil from storage or from the collectors and heats its working fluid by use of a boiler and fluid pump. The working fluid is expanded through a turbine. Cost effectiveness for the solar pump was calculated as a function of the Rankine cycle engine efficiency. Minimum system cost occurs at an engine cycle efficiency between 15% and 16%. The cost of purchasing and installing a new irrigation system in the isolated Estancia Valley of NM is estimated to be $50,000. If solar collectors cost about $5/sq ft, solar would be competitive if natural gas cost $5 mcf for a system operating more than 2200 hr/yr, electricity cost $.10/kWh for a system operating 1900 hr/yr, and diesel cost $.55 gal at 2600 hr/yr. (Small-FIRL)

SOLAR IRRIGATION PROGRAM PLAN REVISION,
Sandia Labs., Albuquerque, NM.
R. L. Alvis, and S. C. Vandevender.
Available from the National Technical Information Service, Springfield, VA 22161 as SAND-770730, Price codes: A03 in paper copy, A01 in microfiche. Report SAND 77-0730, 1977. 34 p, 4 fig, 6 ref.

Descriptors: *Irrigation, Irrigation engineering, Pumps, *Pump testing, Energy, *Solar radiation, New Mexico, *Deep wells, Arizona, *Pilot plants.

The ERDA solar irrigation program plan is updated through fiscal year 1979. Construction of the experiment in the Estancia Valley, NM is planned. The system will begin operation, data will be collected, and complete performance calculations will be made. New Mexico State University will plan and design the optimum utilization of off-season energy. Studies will be performed to upgrade the system to power a low energy center pivot system. A study will be initiated to determine the potential market for solar powered irrigation. A deep well experiment will be conducted in AZ. Also, an international workshop is planned to disseminate the results of the first season of operation. (Small-FIRL)

STORMWATER RUNOFF ON URBAN AREAS OF STEEP SLOPE,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
B. C. Yen, V. T. Chow, and A. O. Akan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 755, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-77-168, 1977. 91 p, 28 fig, 10 tab, 48 ref, 3 append.

Descriptors: *Mathematical models, *Storm runoff, *Urban runoff, *Slopes, *Runoff forecasting, Hydraulic engineering, Hydraulics.

The applicability of commonly used urban storm runoff prediction models to drainage basins with steep slopes was investigated. The hydraulics of runoff on steep slope areas was reviewed, and how it differs from that of mild slope areas was discussed. Also, the difficulties in applying commonly used methods to steep slope basins were presented. It appears that engineers may not be familiar wit the problems associated with steep slope areas an may not realize that numerical results given usin conventional methods may not be reliable. A simple method for steep slopes was proposed, an an example utilizing data from the Baker Stree Drainage Basin in San Francisco, is provided (Small-FIRL)

CAUSES AND EFFECTS OF 3-PHASE POWE UNBALANCE.
Water Well Journal, Vol. 33, No. 3, p 54-5 March, 1979. 1 tab.

Descriptors: *Pumps, *Electric motors, Installa tion, Electric currents, Electrical equipment Safety, Water wells.

The problem of unbalanced electrical loads to sub mersible pump motors is discussed. A step-by-ste procedure is outlined for proper pump installation A chart is provided which matches motor KVA with motor horsepower. A simple method of cal culating the percent of current unbalance is use for three examples of motor hookups. The hooku with the lowest percentage of current unbalanc will result in maximum motor efficiency. The per centage of current unbalance should not exceed 5%. (Purdin-NWWA)

HEAT PUMP UPDATE,
National Water Well Association, Worthington, OH.
D. Bacon.
Water Well Journal, Vol. 33, No. 3, p 70, March, 1979. 1 tab.

Descriptors: *Heat pumps, *Cost comparisons, *Efficiencies, Heating, Economics, Ground water.

The Coefficient of Performance (COP) and operating cost of a demonstration ground water heat pump are compared with the air-to-air heat pump and other conventional heating systems for the months of November and December, 1978. The ground water heat pump had a COP of approximately 3.0, meaning that it produced three times more energy than it consumed. This resulted in a saving of 33% over the air-to-air heat pump for the specified months. Comparative data was accumulated for the central Ohio area. (Purdin-NWWA)
W79-06010

BASIC PERFORMANCE FACTORS OF CENTRIFUGAL PUMPS.
Water Well Journal, Vol. 33, No. 3, p 61-63. March, 1979.

Descriptors: *Centrifugal pumps, *Performance, Pressure head, Capacity, Horsepower, Curves, Pump testing, Efficiencies, Water wells.

Four factors which determine the performance of centrifugal pumps are: head or pump pressure; capacity it delivers; horsepower it requires; and efficiency. Pump head is usually given in terms of how many feet of water it can support. Total pressure is the sum of static pressure and motion pressure or velocity head. Capacity is the number of gallons per minute a pump will deliver. Centrifugal pumps depend on three types of horsepower: water, brake, and wire-to-water. Formula for the derivation of each type are given. Pump performance is shown through the use of performance curves. Head-capacity curves and horsepower curves must be determined from pump tests. A formula to calculate the pump efficiency curve is given. When pumping rpm is changed, effects can be calculated by using affinity laws which state that: pump capacity changes directly with speed; head changes with the square of the pumping rpm; and brake horsepower changes with the cube of pumping rpm. (Purdin-NWWA)

TILIZATION OF SEWAGE SLUDGE FOR ERRAIN STABILIZATION IN COLD RE-IONS,
rmy Terrestrial Sciences Center, Hanover, NH.
. A. Gaskin, W. Hannel, A. J. Palazo, R. E. ates, and L. E. Stanley.
vailable from the National Technical Information ervice, Springfield, VA 22161 as AD-A047 368, rice codes: A03 in paper copy, A01 in microfiche. pecial Report 77-37 November 1977. 38 p, 29 fig, 3 tab, 6 ref, append.

escriptors: *Erosion control, *Soil stabilization, Sewage sludge, *Vegetation establishment, *Nu-ients, Moisture content, Runoff, Cold regions, ew Hampshire, Waste water, Sludge disposal, unicipal wastes, Fertilizers.

ourteen test plots were established in Hanover, ew Hampshire to evaluate the effectiveness of ewage sludgeand primary effluent in the stabiliza-on of terrain in cold regions. The plots were 10 y 40 ft with individual 350 gal tanks to collect ediment and were located at an angle of 16 de-rees. Variables in 13 of the plots were: the nutri-nt source as fertilizer, sludge, or primary effluent; oisture as irrigation and nonirrigation; erosion ontrol material as jute netting, straw with tacking ompound, and no erosion material; and vegeta-on, three grasses and two legumes. The control lot lacked fertilizer, seed, and erosion control aterial. Results of the study indicated that the rosion control measures had an efficiency of 89.6-9.8%, based on a soil loss from the control plot of 4,531 lb (dry weight)/acre. Sludge was found to ct as both a nutrient source and an erosion control aterial and reduced runoff velocity and absorbed oisture. When soil loss was considered a function f the nutrient source, sludge-treated plots lost an verage of 150 lb soil/acre, fertilized plots lost 814 b/acre, and primary effluent treated plots lost 81.7 lb/acre. Study of Multi-Phase Ejectors for Distillation Desalination Systems,
W79-06274 3A

Research and Development of Badger-Hickman Centrifugal Distillation Techniques and Equipments.
W79-06276 3A

Effects of Mechanical Agitation on Drying Rate of Fine-Grained Dredged Material,
W79-06339 4A

Role of Evaporation in Springtime Runoff Losses in the Drainage Basins of the Forest Zone of the European USSR,
W79-06409 2D

New Evaluation of the Advisability of Separating the Eastern Shallows of the Northern Caspian,
W79-06413 2D

A Parameterization of the Evaporation from Nonsaturated Surfaces,
W79-06422 2D

Study and Field Evaluation of Solar Sea-Water Stills,
W79-06426 3A

EVAPOTRANSPIRATION

Evapotranspiration from Douglas Fir Stands Exposed to Soil Water Deficits,
W79-06068 2D

Energy Budget Evaluation of the Transpiration-pF Relationship in a Young Pine Forest,
W79-06069 2D

EXPLOITATION

Sediment Characteristics, Stability, and Origin of the Barrier Island-Lagoon Complex, North Arctic Alaska,
W79-06206 5C

FABRICATION

Fabrication of Smooth Tubes for Large Multistage Flash Evaporator Desalination Plants,
W79-06089 3A

Expanded Glassy Polymers and Polyelectrolyte Complexes as Reverse Osmosis and Ion-Selective Membranes,
W79-06427 3A

Reverse Osmosis for Water Desalination,
W79-06437 3A

Expanded Glassy Polymers as Reverse Osmosis Membranes,
W79-06441 3A

Reverse Osmosis for Water Desalination,
W79-06445 3A

Polyelectrolyte Complexes as Reverse Osmosis and Ion-Selective Membranes,
W79-06446 3A

FAST ICE

Study of Climatic Effects on Fast Ice Extent and Its Seasonal Decay Along the Beaufort-Chukchi Coasts,
W79-06195 5C

FAULTS (GEOLOGIC)

Shallow Faulting, Bottom Instability, and Movement of Sediments in Lower Cook Inlet and Western Gulf of Alaska,
W79-06225 5C

Faulting, Sediment Instability, Erosion, and Deposition Hazards of the Norton Basin Sea Floor,
W79-06226 5C

FEASIBILITY

The Feasibility of Establishing Operational Water Hyacinth-Based Systems at the Treatment Facilities of Existing Cities,
W79-06384 5D

The Potential Contribution of Desalting to Future Water Supply in New Mexico,
W79-06428 3A

FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1972

The Integrity of Water,
W79-06103 5G

FERMENTATION

Utilization of Spent Sulfite Liquor by Pekilo Fermentation and Ultrafiltration,
W79-06137 5D

FERNHILL (NEW ZEALAND)

Water Temperatures of the Ngaruroro River at Three Stations,
W79-06417 2E

FERTILIZERS

Removal of Scale-Forming Compounds from Sea Water,
W79-06270 3A

FIELD DATA

Identification of Ecosystem Models by Field Data (Inverse Problems of Ecology),
W79-06177 6A

FILMS

Producing Permanently Hydrophylic Surfaces on Plastic Films for Solar Stills,
W79-06431 3A

FILTRATION

Monograph on Carbon: Activated Charcoal,
W79-06104 5F

Processing Raw Sewage by Ultrafiltration,
W79-06146 5D

Pilot Plant Studies to Effect Chrysotile Asbestos Fibre Reduction During Potable Water Treatment,
W79-06158 5F

Feasibility Study of Vacuum Filtration Systems for Dewatering Dredged Material,
W79-06332 5E

Laboratory Results of Laundry Wastewater Treatment,
W79-06375 5D

Evaluation of Membrane Separation Processes, Carbon Adsorption, and Ozonation for Treatment of MUST Hospital Wastes,
W79-06386 5D

A Theory on Water Filtration, Part I: Background,
W79-06387 5F

A Theory on Water Filtration Part II. Model Presentation,
W79-06388 5F

A Theory on Water Filtration, Part III - Sensitivity Analysis, Data Evaluation and Conclusions,
W79-06389 5F

FINANCING

Rural Water and Sewer Systems Problems, Needs, Issues, Opportunities, and Goals,
W79-06102 6E

FINITE ELEMENT ANALYSIS

Finite-Element Analysis of the Transport of Water and Solutes in Tile-Drained Soils,
W79-06393 2F

FISH

Fishes,
W79-06460 5

FISH BEHAVIOR

Behavioral Thermoregulation and Diel Activi in White Sucker (Catostomus Commersoni),
W79-06478 5

Behavioral Thermoregulation in the Rock Ba Ambloplites Rupestris,
W79-06480 5

FISH HATCHERIES

Weyerhaeuser's Raising Salmon -- Uses M Cooling Water at Hatchery,
W79-06118 3

FISH TOXINS

Acute Toxicity of Copper to Some Fishes High Alkalinity Water,
W79-06235 5

FLASH DISTILLATION

Chamber Geometry in Multi-Stage Flash Eva orators.
W79-06438 3

Survey of Materials Behavior in Multi-Sta Flash Distillation Plants,
W79-06442 3

FLOCCULATION

Studies of Flocculation and Sedimentatio Treatment of Pulp Mill Effluent. (Part 2). A Approach of a Closed System Using Ettringi Compounds, (In Japanese),
W79-06127 5

Laboratory Results of Laundry Wastewat Treatment,
W79-06375 5

FLOOD FORECASTING

Computation and Forecast of the Springtim Flood Volume in the Vyatka River,
W79-06408 2

Estimation of the Error in the Determination Soil Water Storage at Observation Points,
W79-06410 2

FLOOD PLAIN INSURANCE

Complying with the Flood Disaster Protectio Act,
W79-06299 6

FLOOD PLAIN MANAGEMENT

Legal Aspects of Flood Plain Management,
W79-06049 6

FLOOD PLAIN ZONING

Complying with the Flood Disaster Protectio Act,
W79-06299 6

FLOOD PLAINS

Complying with the Flood Disaster Protectio Act,
W79-06299 6

FLOOD PROFILES

Hydrologic Data for Urban Studies in th Dallas, Texas Metropolitan Area, 1976,
W79-06314 4

FLOODS

Computation and Forecast of the Springtim Flood Volume in the Vyatka River,
W79-06408 2

Role of Hydrophysical Soil Properties in Sprin Flood Runoff Losses,
W79-06411 2

FLOTATION
Purification of High-Ash Wastewaters in Flotation Savealls (Ochistka vysokozol'nykh stochnykh vod na flotatsionnykh lovushkakh),
W79-06142 5D

FLOW
Determining Water Quality Criteria for Water Flow in Solving the Problems of Controlling Water Pollution,
W79-06174 5G

Flow Measurement Using a Conductivity Flow Meter--Initial Investigation,
W79-06419 7B

FLOW CONTROL
Evaluation of Backflow Prevention Devices: A State-of-the-Art Report,
W79-06378 8A

FLOW MEASUREMENT
Flow Measurement Using a Conductivity Flow Meter--Initial Investigation,
W79-06419 7B

FLOW RATES
Land Treatment of Wastewater at West Dover, Vermont,
W79-06341 5E

FLOWMETERS
Flow Measurement Using a Conductivity Flow Meter--Initial Investigation,
W79-06419 7B

FLUE GAS DESULFURIZATION
Economic Assessment of FGD Sludge Disposal Alternatives,
W79-06041 5E

FLUORESCENCE
Direct and Indirect Immunofluorescence Staining of Fecal Streptococci for Rapid Assessment of Water Quality,
W79-06133 5A

FLUSHING
Hydrography of Harbors, Lagoons and Sloughs,
W79-06454 5B

FLUVIAL SEDIMENTS
Entropy Concepts in Fluvial Geomorphology: A Reevaluation,
W79-06074 2E

FLY ASH
Color Removal from Pulp Mill Effluent Using Fly Ash Acidified with Chlorination Stage Effluent,
W79-06135 5D

Mode of Elemental Dissipation from Ash Basin Effluent,
W79-06265 5A

FOAM FRACTIONATION
Final Report on Foam Fractionation of Inorganic Solutions,
W79-06282 3A

FOOD ABUNDANCE
Growth, Food Conversion and Survival of O-Group English Sole (Parophrys Vetulus Girard) at Five Temperatures and Five Rations,
W79-06485 5C

FOOD CHAINS
Characterization of the Nearshore Hydrodynamics of an Arctic Barrier Island - Lagoon System,
W79-06205 5C

FORECASTING
Construction of Models for Forecasting and Controlling Water Quality in a River Basin on Principles of Self-Organization,
W79-06171 2E

A Meteorological Basis for Long-Range Forecasting of Summer and Early Autumn Sea Ice Conditions in the Beaufort Sea,
W79-06196 5C

FOREIGN RESEARCH
Cloud Physics and Weather Modification.
W79-06046 2B

FOREST WATERSHEDS
Sediment Yields from Small Forested Catchments North Westland-Nelson, New Zealand,
W79-06418 2J

FORESTS
Energy Budget Evaluation of the Transpiration-pF Relationship in a Young Pine Forest,
W79-06069 2D

The Effect of Intercepted Rainfall on the Water Balance of a Hardwood Forest,
W79-06072 2A

Runoff-Regulating Properties of Drained Forests in Latvia,
W79-06414 2E

FORT CARSON (CO)
Environmental Baseline Descriptions for Use in the Management of Fort Carson Natural Resources. Report 4. Analysis and Assessment of Soil Erosion in Selected Watersheds,
W79-06043 4D

FOULING
Alternatives to Chlorination for Control of Condenser Tube Bio-Fouling,
W79-06358 5F

FREEZING
Development of the Zone-Purification Process for Preparing Potable Water from Sea Water,
W79-06083 3A

Evaluation of the Zone-Purification Process as a Method of Preparation of Potable Water from Sea Water,
W79-06085 3A

Further Development of a Direct-Freezing Continuous Wash-Separation Process for Saline Conversion,
W79-06086 3A

Saline Water Conversion by Direct Freezing with Butane,
W79-06268 3A

Research on Saline Water Conversion by Freezing,
W79-06273 3A

Kinetics of Ice Nucleation from Water and Electrolyte Solutions,
W79-06283 3A

Secondary Nucleation of Ice in a Suspension of Crystals in Turbulent Cylindrical Couette Flow,
W79-06284 3A

Nucleation and Growth of Ice Crystals,
W79-06425 1A

FREQUENCY ANALYSIS
Low-Flow Frequency of Minnesota Streams,
W79-06321 7C

GAS CHROMATOGRAPHY
Evaluation of High Performance Liquid Chromatography Packings for the Concentration and Separation of Organic Materials in Water,
W79-06096 5D

GASES
Faulting, Sediment Instability, Erosion, and Deposition Hazards of the Norton Basin Sea Floor,
W79-06226 5C

GEOCHEMISTRY
Distributions of Grain Size, Total Carbon, Heavy and Light Minerals, Clay Mineralogy, and Inorganic Geochemistry, Outer Continental Shelf, Southern Bering Sea,
W79-06218 5C

GEOGRAPHIC-ECONOMIC ASPECTS
Geographic-Economic Aspects of Pollution Control Systems,
W79-06172 6B

GEOHYDROLOGIC UNITS
Sacramento Valley: A Vast Underground Reservoir,
W79-06006 4B

GEOLOGIC HISTORY
Geological Features,
W79-06450 5B

GEOLOGY
Sea-Floor Instability of Continental Shelf Offshore Central and Northern California,
W79-06465 2J

GEOMORPHOLOGY
An Objective Criterion for the Selection of Representative Basins,
W79-06070 2E

Entropy Concepts in Fluvial Geomorphology: A Reevaluation,
W79-06074 2E

Operation of an Alaskan Facility for Applications of Remote-Sensing Data to OCS Studies,
W79-06200 7B

The Environmental Geology and Geomorphology of the Barrier Island - Lagoon System Along the Beaufort Sea Coastal Plain from Prudhoe Bay to the Colville River,
W79-06207 5C

Oil Spill Vulnerability of the Beaufort Sea Coast,
W79-06210 5C

Yukon Delta Coastal Processes Study,
W79-06219 5C

Coastal Processes and Morphology of the Bering Sea Coast of Alaska,
W79-06228 2J

Shoreline History of Chukchi and Beaufort Seas as an Aid to Predicting Offshore Permafrost Conditions,
W79-06229 2J

A Geomorphic Model for Use in Streamflow Routing,
W79-06259 2E

GEORGIAN BAY
Water Balance Estimate for Georgian Bay in 1974,
W79-06076 2A

GEOTHERMAL ENERGY
Proceedings of the First Workshop on Sampling Geothermal Effluents.
W79-06052 2F

GEOTHERMAL STUDIES
Proceedings of the First Workshop on Sampling Geothermal Effluents.
W79-06052 2F

Geothermal Energy Development,
W79-06053 2F

Geothermal Effluents, Their Toxicity and Prioritization,
W79-06054 5B

Some Problems Involved with Sampling Geothermal Sources,

A Statistician's View of Weather Modification Technology (A Review),
W79-06045 2B

Study of Sulfate Pulp Mill Effluent Toxicity (Estudio de la toxicidad de los efluentes de una fabrica de pasta al sulfato),
W79-06128 5C

REYNOLDS NUMBER
Investigation of the Use of Acoustic Vibrations to Improve Heat Transfer Rates and Reduce Scaling in Distillation Units Used for Saline Water Conversion.
W79-06288 3A

RIO BLANCIO (MEXICO)
Determination of the Mechanism of Recharge in the Los Naranjos Area in Mexico Using Environmental Isotope Techniques,
W79-06067 2F

RIVER BASINS
American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management.
W79-06166 6A

Optimization of Water Quality Control in a River Basin,
W79-06168 6A

Modeling Water Quality in River Basins,
W79-06169 5A

Water Quality Management Models: Specific Cases and Some Broader Observations,
W79-06170 6A

Construction of Models for Forecasting and Controlling Water Quality in a River Basin on Principles of Self-Organization,
W79-06171 2E

Optimal Design and Operation of Multi-Reservoir Systems: Volume I: Explicitly Stochastic Models,
W79-06185 6A

RIVER FLOW
Construction of Models for Forecasting and Controlling Water Quality in a River Basin on Principles of Self-Organization,
W79-06171 2E

RIVER LIFFEY ESTUARY (IRELAND)
The Distribution of Organic Material and Trace Metals in Sediments from the River Liffey Estuary, Dublin,
W79-06239 2L

RIVERS
Dispersion of Soluble Pollutants in Non-Uniform Rivers, I. Theory,
W79-06065 5B

Dispersion of Soluble Pollutants in Non-Uniform Rivers, II. Application to Experimental Results,
W79-06066 5B

Determination of the Mechanism of Recharge in the Los Naranjos Area in Mexico Using Environmental Isotope Techniques,
W79-06067 2F

An Annotated Bibliography on River Recreation.
W79-06099 6B

Efficient Simulation of Nonlinear Steady Flow,
W79-06253 2E

Design Model for Thermal Effluents in Rivers,
W79-06267 5B

Particle Size of Sediments Collected from the Bed of the Amazon River and Its Tributaries in May and June 1977,
W79-06309 2J

RIVERS

Simple Non-Linear Models for the Cooling of Well-Mixed Rivers,
W79-06396 2A

Water Temperatures of the Ngaruroro River at Three Stations,
W79-06417 2E

ROCK RIVER
Simulation of Streamflow of Rock River at Lake Koshkonong, Wisconsin, to Determine Effects of Withdrawal of Powerplant-Cooling Water,
W79-06315 6A

ROSS ICE SHELF
Tritium and Carbon-14 Distributions in Seawater from Under the Ross Ice Shelf Project Ice Hole,
W79-06241 2L

Ocean Tide and Waves Beneath the Ross Ice Shelf,
W79-06242 2L

Circulation and Melting Beneath the Ross Ice Shelf,
W79-06243 2L

Ross Sea Region in the Middle Miocene: A Glimpse into the Past,
W79-06244 2J

Ross Ice Shelf Sea Temperatures,
W79-06245 2C

Miocene Glaciomarine Sediments from Beneath the Southern Ross Ice Shelf, Antarctica,
W79-06246 2J

The Ross Ice Shelf Project,
W79-06247 2C

ROSS SEA
Tritium and Carbon-14 Distributions in Seawater from Under the Ross Ice Shelf Project Ice Hole,
W79-06241 2L

Ocean Tide and Waves Beneath the Ross Ice Shelf,
W79-06242 2L

ROSWELL TEST FACILITY
Annual Report (FY 1969), Roswell Test Facility Roswell, New Mexico,
W79-06281 3A

ROUTING
A Geomorphic Model for Use in Streamflow Routing,
W79-06259 2E

Simulation of Streamflow of Rock River at Lake Koshkonong, Wisconsin, to Determine Effects of Withdrawal of Powerplant-Cooling Water,
W79-06315 6A

RUNNING WATERS
In Situ Treatment of Hazardous Material Spills in Flowing Streams,
W79-06348 5D

RUNOFF
Instantaneous Unit Hydrograph with Negative Ordinates--Possible,
W79-06257 2E

Computation and Forecast of the Springtime Flood Volume in the Vyatka River,
W79-06408 2E

Role of Evaporation in Springtime Runoff Losses in the Drainage Basins of the Forest Zone of the European USSR,
W79-06409 2D

Runoff-Regulating Properties of Drained Forests in Latvia,
W79-06414 2E

RUNOFF FORECASTING
Forecasting Seasonal Snowmelt Runoff: A Summary of Experience with Two Models Applied to Three Drainages in the Cascade Mountains of Washington,
W79-06047 2E

Incorporation of Forecasted Seasonal Runoff Volumes into Reservoir Management,
W79-06048 2E

Stormwater Runoff on Urban Areas of Steep Slope,
W79-06380 8B

SAGINAW BAY
Mathematical Modeling Strategies Applied to Saginaw Bay, Lake Huron,
W79-06182 5B

SALINE LAKES
Salinity Transport Between Layers of a Stratified Shear Flow,
W79-06106 2H

SALINE SOLUTIONS
Diffusion in Ternary Aqueous Saline Solutions,
W79-06285 3A

SALINE WATER
Conversion of Saline Water: A Bibliography of Literature Resulting from the Activities Sponsored by the Office of Saline Water.
W79-06433 3A

Inventory of Published and Unpublished Data on the Characteristics of Saline Surface and Ground Waters of South Dakota,
W79-06447 3A

SALINE WATER SYSTEMS
Diffusion in Ternary Aqueous Saline Solutions,
W79-06285 3A

SALINITY
The Salinity Profile of the East Mesa Field as Determined from Dual Induction Resistivity and SP Logs,
W79-06057 2F

Disposal of the Effluents from Desalination Plants: The Effects of Copper Content, Heat and Salinity,
W79-06092 3A

Salt and Water Stress Influences Nitrogen Metabolism in Red Kidney Beans,
W79-06156 2I

Absorption Rates of Ammonium and Nitrate by Red Kidney Beans under Salt and Water Stress,
W79-06157 2I

Circulation and Melting Beneath the Ross Ice Shelf,
W79-06243 2L

Analysis of Brine Disposal in the Gulf of Mexico. Bioassay Results.
W79-06474 5C

Effects of Temperature and Salinity on the Metabolism and Byssal Formation of Brachidontes Variabilis Krauss (Bivalvia),
W79-06494 5C

Synergistic Effects of Temperature, Salinity and Light on the Hermatypic Coral Montipora Verrucosa,
W79-06496 5C

SALT BUILD-UP
Salt Concentration at Phase Boundaries in Desalination Processes,
W79-06275 3A

Salt Concentration at the Surface of Tubular Reverse Osmosis Membranes,
W79-06436 3A

SALTON SEA
Climatological Estimates of Lake Evaporation,
W79-06261 2D

SAMPLE PRESERVATION
Sampling and Preservation Techniques for Waters in Geysers and Hot Springs,
W79-06064 2F

SAMPLING
Proceedings of the First Workshop on Sampling Geothermal Effluents.
W79-06052 2F

Some Problems Involved with Sampling Geothermal Sources,
W79-06055 5A

Field Sampling of Radioactive Geothermal Effluents,
W79-06058 2F

Atmospheric Discharge Sampling While Drilling Geothermal Steam Wells,
W79-06059 2F

Sampling Hot Springs for Radioactive and Trace Elements,
W79-06060 2F

Union Oil Company of California's Geothermal Sampling Techniques,
W79-06061 2F

Sampling a Two-Phase Geothermal Brine Flow for Chemical Analysis,
W79-06062 2F

Approaches to Interpreting Environmental Data,
W79-06063 5A

Sampling and Preservation Techniques for Waters in Geysers and Hot Springs,
W79-06064 2F

Derivation of the Probability Density Function of Certain Biased Samples of Coarse Riverbed Material,
W79-06077 2J

The Impact of Composite Sampling and Other Data Aggregation Procedures on Pollution Detection in the Pulp and Paper Industry,
W79-06141 7A

Particle Size of Sediments Collected from the Bed of the Amazon River and Its Tributaries in May and June 1977,
W79-06309 2J

Lake Erie in Mid-Winter,
W79-06403 2H

Virgin River Study--Utah: March, 1976,
W79-06423 5A

SAND PUMPING
Some Simple Sand Solutions,
W79-06012 8A

SANTA FE (NM)
Impact of a Ski Basin on a Mountain Watershed, I. Bacteriological Water Quality,
W79-06390 5A

SCREENING MODEL
Optimal Design and Operation of Multi-Reservoir Systems: Volume II, Alternative Optimization Models of the Lehigh River Basin,
W79-06186 6A

SEA ICE
Study of Climatic Effects on Fast Ice Extent and Its Seasonal Decay Along the Beaufort-Chukchi Coasts,
W79-06195 5C

A Meteorological Basis for Long-Range Forecasting of Summer and Early Autumn Sea Ice Conditions in the Beaufort Sea,
W79-06196 5C

Mechanics of Origin of Pressure Ridges, Shear Ridges and Hummock Fields in Landfast Ice,
W79-06197 5C

Morphology of Beaufort, Chukchi and Bering Seas near Shore Ice Conditions by Means of Satellite and Aerial Remote Sensing,
W79-06198 5C

Development of Hardware and Procedures for In-Situ Measurement of Creep in Sea Ice,
W79-06199 5C

Operation of an Alaskan Facility for Applications of Remote-Sensing Data to OCS Studies,
W79-06200 7B

The Interaction of Oil with Sea Ice in the Arctic Ocean,
W79-06212 5C

Dynamics of Near-Shore Ice,
W79-06213 5C

Dynamics of Near Shore Ice,
W79-06214 5C

Marine Environmental Problems in the Ice Covered Beaufort Sea Shelf and Coastal Regions,
W79-06217 5C

SEA WATER
Tritium and Carbon-14 Distributions in Seawater from Under the Ross Ice Shelf Project Ice Hole,
W79-06241 2L

Ross Ice Shelf Sea Temperatures,
W79-06245 2C

SEASONAL
Study of Climatic Effects on Fast Ice Extent and Its Seasonal Decay Along the Beaufort-Chukchi Coasts,
W79-06195 5C

The Role of Sewage Lagoons at Corps of Engineers Recreation Areas,
W79-06335 5D

Land Treatment of Wastewater at West Dover, Vermont,
W79-06341 5E

SEDIMENT CONCENTRATION
Unit Stream Power Equations for Total Load,
W79-06392 2J

SEDIMENT CONTROL
Methods to Control Fine-Grained Sediments Resulting from Construction Activity,
W79-06101 4D

SEDIMENT DISTRIBUTION
Distributions of Grain Size, Total Carbon, Heavy and Light Minerals, Clay Mineralogy, and Inorganic Geochemistry, Outer Continental Shelf, Southern Bering Sea,
W79-06218 5C

SEDIMENT LOAD
Unit Stream Power Equations for Total Load,
W79-06392 2J

SEDIMENT TRANSPORT
Oil Spill Vulnerability of the Beaufort Sea Coast,
W79-06210 5C

Shallow Faulting, Bottom Instability, and Movement of Sediments in Lower Cook Inlet and Western Gulf of Alaska,
W79-06225 5C

Faulting, Sediment Instability, Erosion, and Deposition Hazards of the Norton Basin Sea Floor,
W79-06226 5C

Sediment Transport in Norton Sound - Northern Bering Sea, Alaska,
W79-06227 5C

Trends in Sedimentation,
W79-06319 2J

Sediment Yields from Small Forested Catchments North Westland-Nelson, New Zealand,
W79-06418 2J

SEDIMENT YIELD
Trends in Sedimentation,
W79-06319 2J

Unit Step and Frequency Response Functions Applied to the Watershed Fluvial System,
W79-06395 2J

Sediment Yields from Small Forested Catchments North Westland-Nelson, New Zealand,
W79-06418 2J

SEDIMENTATION
Studies of Flocculation and Sedimentation Treatment of Pulp Mill Effluent. (Part 2). An Approach of a Closed System Using Ettringite Compounds, (In Japanese),
W79-06127 5D

Trends in Sedimentation,
W79-06319 2J

SEDIMENTS
Natural Distribution and Environmental Background of Trace Heavy Metals in Alaskan Shelf and Estuarine Areas,
W79-06024 5B

Hydrocarbons: Natural Distribution and Dynamics on the Alaskan Outer Continental Shelf,
W79-06025 5C

Characterization of Organic Matter in Sediments from Lower Cook Inlet,
W79-06026 5B

Factors Affecting Phosphate Absorption Equilibria in Lake Sediments,
W79-06032 5C

Delineation and Engineering Characteristics of Permafrost Beneath the Beaufort Sea,
W79-06215 2C

The Hydrodynamics and Sedimentology of a High (Tidal and Wave) Energy Embayment (Swansea Bay, Northern Bristol Channel),
W79-06237 2J

The Distribution of Organic Material and Trace Metals in Sediments from the River Liffey Estuary, Dublin,
W79-06239 2L

Organic Matter in Surficial Sediments of the Miramichi Estuary, New Brunswick, Canada,
W79-06240 2L

Ross Sea Region in the Middle Miocene: A Glimpse into the Past,
W79-06244 2J

Miocene Glaciomarine Sediments from Beneath the Southern Ross Ice Shelf, Antarctica,
W79-06246 2J

Unit Step and Frequency Response Functions Applied to the Watershed Fluvial System,
W79-06395 2J

Impact of Man's Activities on the Chemical Composition of the Sediments of Lakes Superior and Huron,
W79-06399 5B

Distribution of Suspended Sediments in the Shallows of Reservoirs and Possibility of Estimating Them by the Integration Method,
W79-06412 2J

Sediment Yields from Small Forested Catchments North Westland-Nelson, New Zealand,
W79-06418 2J

SEEPAGE
Estimating Seepage from a Reservoir from Change in Hydraulic Head,
W79-06250 2F

Breaking Emulsions in Navy Bilge Collection and Treatment Systems,
W79-06368 5D

SEISMIC STUDIES
Beaufort Seacoast Permafrost Studies,
W79-06223 2C

SELF-ORGANIZATION
Construction of Models for Forecasting and Controlling Water Quality in a River Basin on Principles of Self-Organization,
W79-06171 2E

SEPARATION TECHNIQUES
Control of Refinery Vacuum Producing Systems, Wastewater Separators and Process Unit Turnarounds,
W79-06355 5D

Performance Testing of Oil Mop Zero Relative Velocity Oil Skimmer,
W79-06359 5G

Oil/Water Separation State-of-the-Art,
W79-06360 5F

SEPTIC TANKS
Characteristics of Effluents from Separate Septic Tanks Treating Grey Water and Black Water from the Same House,
W79-06161 5D

The Relation of Soil Characteristics to the Failure of Domestic Waste-Water Disposal Systems,
W79-06165 5D

Assessment of Nonpoint Sources Areawide Waste Treatment Management Plan for the Greater Houston Area.
W79-06344 5B

SETTLING BASINS
Analysis of Settling Basin Operation in the Pulp and Paper Industry (Metsaeteollisuuden jaetevesien selkeytysaltaat),
W79-06121 5D

SEWAGE BACTERIA
Direct and Indirect Immunofluorescence Staining of Fecal Streptococci for Rapid Assessment of Water Quality,
W79-06133 5A

SEWAGE EFFLUENTS
Effect of Illuviated Deposits on Infiltration Rates and Denitrification During Sewage Effluent Recharge,
W79-06107 5D

Processing Raw Sewage by Ultrafiltration,
W79-06146 5D

SEWAGE LAGOONS
The Role of Sewage Lagoons at Corps of Engineers Recreation Areas,
W79-06335 5D

The Feasibility of Establishing Operational Water Hyacinth-Based Systems at the Treatment Facilities of Existing Cities,
W79-06384 5D

SEWAGE SLUDGE
Utilization of Sewage Sludge for Terrain Stabilization in Cold Regions,
W79-06342 8D

Odor Assessment for Sewage Sludge Samples 300A01002,
W79-06364 5D

Effects of Ocean Dumping Activity Mid-Atlantic Bight - 1976 Interim Report,
W79-06475 5C

SEWAGE TREATMENT
Experiments Aimed at the Removal of Phosphate by Electrochemical Methods,
W79-06033 5D

Environmental Assessment Guidance Municipal Sewage Treatment Works Program.
W79-06095 5F

Control of Virus Pathogens in Municipal Wastewater and Residuals by Irradiation with High Energy Electrons,
W79-06148 5D

Dewatering Sewage Sludge by Electro-Osmosis. Part II Scale-Up Data,
W79-06326 5D

Conceptual Design of a Pilot Wastewater Irradiation Facility,
W79-06333 5D

Land Treatment of Wastewater at West Dover, Vermont,
W79-06341 5E

Appraisal of Powdered Activated Carbon Processes for Municipal Wastewater Treatment,
W79-06352 5D

SEWERAGE
Rural Water and Sewer Systems Problems, Needs, Issues, Opportunities, and Goals,
W79-06102 6E

Utility Distribution Systems in Iceland,
W79-06337 8A

SEWERS
Economic Analysis, Root Control, and Backwater Flow Control as Related to Infiltration/Inflow Control: Appendices,
W79-06100 8A

Feasibility Study on In-Sewer Treatment Methods,
W79-06350 5D

SHALLOW WATER
Distribution of Suspended Sediments in the Shallows of Reservoirs and Possibility of Estimating Them by the Integration Method,
W79-06412 2J

New Evaluation of the Advisability of Separating the Eastern Shallows of the Northern Caspian,
W79-06413 2D

SHIPS
Breaking Emulsions in Navy Bilge Collection and Treatment Systems,
W79-06368 5D

Evaluation of Ozonation and Chlorination for Disinfection of Blackwater,
W79-06370 5D

Enzyme Technology for Shipboard Waste Management,
W79-06372 5D

SIMULATION ANALYSIS
Hydronomic Analysis: A Method for Regional Analysis of Economic and Water Resources Relationships,
W79-06001 6B

American-Soviet Symposium on Use of Mathematical Models to Optimize Water Quality Management.
W79-06166 6A

Planning Comprehensive Water Quality Protection Systems,
W79-06167 6A

Mathematical Modeling of Eutrophication Processes in Lake Ontario,
W79-06175 5C

Mathematical Modeling Strategies Applied to Saginaw Bay, Lake Huron,
W79-06182 5B

Descriptive Simulation Model for Forecasting the Condition of a Water Ecosystem,
W79-06183 5A

Optimal Design and Operation of Multi-Reservoir Systems: Volume II, Alternative Optimization Models of the Lehigh River Basin,
W79-06186 6A

Geothermal Reservoir Simulation 2. Numerical Solution Techniques for Liquid- and Vapor-Dominated Hydrothermal Systems,
W79-06304 6A

SIRTE BASIN (LIBYA)
Groundwater Recharge and Paleoclimate in the Sirte and Kufra Basins, Libya,
W79-06249 2F

SKIING
Impact of a Ski Basin on a Mountain Watershed, I. Bacteriological Water Quality,
W79-06390 5A

SKIMMING
Performance Testing of Oil Mop Zero Relative Velocity Oil Skimmer,
W79-06359 5G

Performance Testing of Three Offshore Skimming Devices,
W79-06365 5G

SLOPES
Stormwater Runoff on Urban Areas of Steep Slope,
W79-06380 8B

SLUDGE DIGESTION
Beneficial Disposal of Water Purification Plant Sludges in Waste-Water Treatment,
W79-06361 5D

Odor Assessment for Sewage Sludge Samples 300A01002,
W79-06364 5D

SLUDGE DISPOSAL
Economic Assessment of FGD Sludge Disposal Alternatives,
W79-06041 5E

Management of Metal-Finishing Sludge,
W79-06347 5D

Multimedium Management of Municipal Sludge.
W79-06379 5E

SLUDGE TREATMENT
Dewatering Sewage Sludge by Electro-Osmosis. Part 1. Basic Studies,
W79-06325 5D

Management of Metal-Finishing Sludge,
W79-06347 5D

Odor Assessment for Sewage Sludge Samples 300A01002,
W79-06364 5D

SLURRIES
Effects of Mechanical Agitation on Drying Rate of Fine-Grained Dredged Material,
W79-06339 4A

SMALL WATERSHEDS
Environmental Baseline Descriptions for Use in the Management of Fort Carson Natural Resources. Report 4. Analysis and Assessment of Soil Erosion in Selected Watersheds,
W79-06043 4D

SNOWMELT
Forecasting Seasonal Snowmelt Runoff: A Summary of Experience with Two Models Applied to Three Drainages in the Cascade Mountains of Washington,
W79-06047 2E

Incorporation of Forecasted Seasonal Runoff Volumes into Reservoir Management,
W79-06048 2E

Role of Evaporation in Springtime Runoff Losses in the Drainage Basins of the Forest Zone of the European USSR,
W79-06409 2D

SOIL AMENDMENTS
Efficient Amendment Use in Sodic Soil Reclamation,
W79-06150 5G

SOIL CHEMISTRY
Adsorption and Extractability of Molybdenum in Relation to Some Chemical Properties Soil,
W79-06155 2K

SOIL CONTAMINATION
Rates of Leaching of Radium from Contaminated Soils: An Experimental Investigation of Radium Bearing Soils from Port Hope, Ontario,
W79-06400 5B

SOIL DISPOSAL FIELDS
Solid Waste Disposal by Landspreading Techniques,
W79-06343 5E

SOIL EROSION
Environmental Baseline Descriptions for Use in the Management of Fort Carson Natural Resources. Report 4. Analysis and Assessment of Soil Erosion in Selected Watersheds,
W79-06043 4D

SOIL MOISTURE
Estimation of the Pore Size Distribution from the Moisture Characteristic,
W79-06258 2G

SOIL PROPERTIES
Role of Hydrophysical Soil Properties in Spring Flood Runoff Losses,
W79-06411 2G

SOIL STABILIZATION
Utilization of Sewage Sludge for Terrain Stabilization in Cold Regions,
W79-06342 8D

SOIL TESTS
A Rapid Method for Estimating the Nitrogen-Supplying Capability of a Soil,
W79-06159 2G

Field Testing of Several Nitrogen Availability Indexes,
W79-06160 2G

A Geomorphic Model for Use in Streamflow Routing,
W79-06259 2E

Hydrologic Data, 1974-77, Stovepipe Wells Hotel Area, Death Valley National Monument, Inyo County, California,
W79-06313 2A

Simulation of Streamflow of Rock River at Lake Koshkonong, Wisconsin, to Determine Effects of Withdrawal of Powerplant-Cooling Water,
W79-06315 6A

Low-Flow Frequency of Minnesota Streams,
W79-06321 7C

Unit Stream Power Equations for Total Load,
W79-06392 2J

Induced Channel Instability and Hydraulic Geometry of the Mangawhara Stream, New Zealand,
W79-06416 2E

Water Temperatures of the Ngarururoro River at Three Stations,
W79-06417 2E

STREAMS
Dissolved Iron--An Indicator of the Groundwater Component of Small Streams Draining a Granite Terrain, South Carolina,
W79-06078 2E

Effects of Channel Dams on Dissolved Oxygen Concentrations in Northern Illinois Streams,
W79-06234 5G

Final EIS Greensboro-Guilford County, N.C. 201 Wastewater Treatment System Project No. C37037601.
W79-06345 5D

Investigation of the Feasibility of Tertiary Treatment of Municipal Wastewater Stabilization Pond Effluent Using River Wetlands in Michigan,
W79-06383 5D

Field Procedures and Evaluation of a Slug Dilution Gauging Method in Mountain Streams,
W79-06415 5B

Induced Channel Instability and Hydraulic Geometry of the Mangawhara Stream, New Zealand,
W79-06416 2E

STREPTOCOCCUS
Direct and Indirect Immunofluorescence Staining of Fecal Streptococci for Rapid Assessment of Water Quality,
W79-06133 5A

STRUCTURAL ENGINEERING
Coastal Processes and Morphology of the Bering Sea Coast of Alaska,
W79-06228 2J

Seismotectonic Studies of Northeast and Western Alaska,
W79-06230 5C

SULFITE LIQUORS
Utilization of Spent Sulfite Liquor by Pekilo Fermentation and Ultrafiltration,
W79-06137 5D

Biological Control Alternatives for a Sulfite Mill (Effluent),
W79-06138 5D

Pilot Plant Studies of Biological Treatment of Magnesium-Base Sulfite Mill Effluent--Aerated Stabilization Basin and Rotating Biological Surface,
W79-06139 5D

Assessment of the Ability of Biological Treatment to Detoxify Effluents from Sulfite Mills Practicing Chemical Recovery,
W79-06140 5D

SURFACE CURRENTS
Lagrangian Surface Current Measurements on the Outer Continental Shelf,
W79-06194 5C

SURFACE DRAINAGE
A Water Management Model for Shallow Water Table Soils,
W79-06050 2G

SURFACE RUNOFF
Assessing Non-Point Source Pollution. A Detailed Study of a Rural Watershed in the Coastal Plain of Maryland,
W79-06353 5B

SURFACE WATERS
Choosing a Potable Water Supply: What You Need to Know,
W79-06008 6B

Criteria of Water Quality in Relationship with the Final Use of the Receiving Body and Its Assimilation Capactiy (Criterios de calidad del agua en relacion con el uso final del cuerp receptor y su capacidad de asimilacion),
W79-06143 5G

Water Resources Data for Louisiana, Water yar 1978--Volume 1. Central and Northern Louisiana.
W79-06305 7C

Water Resources Data for Louisiana, Water year 1978--Volume 2. Southern Louisiana,
W79-06306 7C

Water Resources Data for Louisiana, Water year 1978--Volume 3. Coastal Louisiana,
W79-06307 7C

Hydrologic Monitoring in the Area of the Tennessee-Tombigbee Waterway, Mississippi-Alabama, Fiscal Year 1978,
W79-06311 2A

Hydrologic, Geologic, and Water-Quality Data, Ochlockonee River Basin Area, Florida,
W79-06318 7C

Water Availability, Cleburne County, Alabama,
W79-06322 7C

SURFACES
A Parameterization of the Evaporation from Nonsaturated Surfaces,
W79-06422 2D

SURVEYS
Drillers and Industry Leaders Look at 1979.
W79-06018 6B

SUSPENDED LOAD
Transport Mechanisms and Hydrocarbon Adsorption Properties of Suspended Matter in Lower Cook Inlet,
W79-06022 5C

SUSPENDED SOLIDS
Alum Addition and Step-Feed Studies in Oxygen-Activated Sludge,
W79-06149 5D

Chrysotile Asbestos Dilution Studies,
W79-06153 5A

A Theory on Water Filtration Part II. Model Presentation,
W79-06388 5F

A Theory on Water Filtration, Part III - Sensitivity Analysis, Data Evaluation and Conclusions,
W79-06389 5F

Distribution of Suspended Sediments in the Shallows of Reservoirs and Possibility of Estimating Them by the Integration Method,
W79-06412 2J

SWANSEA BAY (WALES)
The Hydrodynamics and Sedimentology of a High (Tidal and Wave) Energy Embayment (Swansea Bay, Northern Bristol Channel),
W79-06237 2J

TASTE
Water Treatment: Taste and Odor.
W79-06015 5F

TECHNOLOGY
A Statistician's View of Weather Modification Technology (A Review),
W79-06045 2B

The Responses of the Legal System to Technological Innovation in Aquaculture: A Comparative Study of Mariculture Legislation in California, Florida and Maine,
W79-06300 6E

TECTONICS
Shallow Faulting, Bottom Instability, and Movement of Sediments in Lower Cook Inlet and Western Gulf of Alaska,
W79-06225 5C

TEMPERATURE
Disposal of the Effluents from Desalination Plants: The Effects of Copper Content, Heat and Salinity,
W79-06092 3A

Aerated Lagoon Treatment of Bleached Kraft Mill Effluents at High Temperature,
W79-06136 5D

Complementarity of Thermoregulatory Rhythms in Micropterus Solmoides and M. Dolomieui,
W79-06163 5C

Acclimation to Temperature and Death at High Changing Lethal Temperatures in Cyprinion Macrostomus (Heckel),
W79-06266 5C

Temperature Distribution in the Crystallization of Undercooled Liquids in Cylindrical Tubes,
W79-06272 3A

The Effect of Temperature on the Conversion of Proinsulin in Cod, Gadus Morhua,
W79-06298 5C

Report on the Plant Evaluation at Old Faithful Wastewater Treatment Plant Yellowstone National Park,
W79-06382 5D

Behavioral Thermoregulation and Diel Activity in White Sucker (Catostomus Commersoni),
W79-06478 5C

Metabolic Rate, Temperature Acclimation and Resistance to High Temperature of Soft-Shell Clams, Mya Arenaria, as Affected by Shore Level,
W79-06479 5C

Behavioral Thermoregulation in the Rock Bass, Ambloplites Rupestris,
W79-06480 5C

Ontogenetic Change in Preferred Temperature and Diel Activity of the Yellow Bullhead, Ictalurus Natalis,
W79-06481 5C

Growth, Food Conversion and Survival of O-Group English Sole (Parophrys Vetulus Girard) at Five Temperatures and Five Rations,
W79-06485 5C

Growth and Spawning in the Pectinid Chlamys Opercularis in Relation to Temperature and Phytoplankton Concentration,
W79-06486 5C

The Survival of Embryos of the Annual Fish Nothobranchius Guentheri Exposed to Temperature Extremes and the Subsequent Effects on Embryonic Diapause,
W79-06488 5C

Diel Patterns of Preferred Temperature and Locomotor Activity in the Goldfish Crassius Auratus,
W79-06490 5C

Implication of Geographic Location on Temperature Preference of White Perch, Morone Americana,
W79-06493 5C

Effects of Temperature and Salinity on the Metabolism and Byssal Formation of Brachidontes Variabilis Krauss (Bivalvia),
W79-06494 5C

Effect of Temperature, pH, Antibiotics, Formalin and Malachite Green on the Growth and Survival of Saprolegnia and Achlya Parasitic on Fish,
W79-06495 5C

Synergistic Effects of Temperature, Salinity and Light on the Hermatypic Coral Montipora Verrucosa,
W79-06496 5C

Microsetella Norvegica (Boeck): A Direct Relationship Between Seasonal Sea Temperature and Adult Size in a Planktonic Copepod,
W79-06498 5C

Interspecific and Seasonal Differences in the Temperature Tolerance of Stream Fish,
W79-06499 5C

The Biology of the Marine Sponge Microciona Prolifera (Ellis and Solander). III. Spicule Secretion and the Effect of Temperature on Spicule Size,
W79-06500 5C

TEMPORAL DISTRIBUTIONS

Time and Length Scales for the One-Dimensional Assumption and Its Relation to Ecological Models,
W79-06073 2H

TENNESSEE-TOMBIGBEE WATERWAY

Hydrologic Monitoring in the Area of the Tennessee-Tombigbee Waterway, Mississippi-Alabama, Fiscal Year 1978,
W79-06311 2A

TERRITORIAL SIZE

Geographic-Economic Aspects of Pollution Control Systems,
W79-06172 6B

TERTIARY TREATMENT

Final EIS Greensboro-Guilford County, N.C. 201 Wastewater Treatment System Project No. C37037601.
W79-06345 5D

Investigation of the Feasibility of Tertiary Treatment of Municipal Wastewater Stabilization Pond Effluent Using River Wetlands in Michigan,
W79-06383 5D

TESTING

Performance Testing of Oil Mop Zero Relative Velocity Oil Skimmer,
W79-06359 5G

Oil/Water Separation State-of-the-Art,
W79-06360 5F

Performance Testing of Three Offshore Skimming Devices,
W79-06365 5G

Evaluation of Backflow Prevention Devices: A State-of-the-Art Report,
W79-06378 8A

THE GEYSERS (CA)

Field Sampling of Radioactive Geothermal Effluents,
W79-06058 2F

THE NETHERLANDS

Urbanization and Changes in Precipitation, A Statistical Approach,
W79-06248 2B

THERMAL POLLUTION

Modeling the Dispersion of Pollution and Thermal Pollutation in Water Bodies,
W79-06176 5C

Design Model for Thermal Effluents in Rivers,
W79-06267 5B

The Final Thermal Preferendum of Fishes: Shuttling Behavior and Acclimation Overshoot,
W79-06482 5C

Growth and Adaptation to Sea Water in Underyearling Sockeye (Oncorhynchus Nerka) and Coho (O. Kisutch) Salmon Subjected to Regimes of Constant or Changing Temperature and Day Length,
W79-06483 5C

The Importance of Habitat Temperatures for Growth in the Tropical Cichlid Tilapia Rendalli Boulenger,
W79-06484 5C

The Effect of the Rate of Change of Temperature on the Resistance of Asellus Aquaticus (L.) to High Lethal Temperatures,
W79-06491 5C

Size Variation and the Distribution of Hemimetabolous Aquatic Insects: Two Thermal Equilibrium Hypotheses,
W79-06497 5C

THERMAL REGIME

Subsea Permafrost: Probing, Thermal Regime and Data Analysis,
W79-06222 2C

THERMAL STRESS

Upper Lethal Water Temperature Levels for English Sole (Parophrys Vetulus) and Rock Sole (Lepidopsetta Bilineata) Subjected to Gradual Thermal Increases,
W79-06489 5C

Effect of Temperature and Salinity on Heat Tolerance of Emerita Holthuisi,
W79-06492 5C

THERMAL WATER

Proceedings of the First Workshop on Sampling Geothermal Effluents.
W79-06052 2F

Geothermal Energy Development,
W79-06053 2F

Geothermal Effluents, Their Toxicity and Prioritization,
W79-06054 5B

Some Problems Involved with Sampling Geothermal Sources,
W79-06055 5A

Drill Stem Testing and Sampling of Geo-Pressured Brines,
W79-06056 5A

The Salinity Profile of the East Mesa Field as Determined from Dual Induction Resistivity and SP Logs,
W79-06057 2F

Field Sampling of Radioactive Geothermal Effluents,
W79-06058 2F

Sampling Hot Springs for Radioactive and Trace Elements,
W79-06060 2F

Sampling a Two-Phase Geothermal Brine Flow for Chemical Analysis,
W79-06062 2F

Geothermal Reservoir Simulation 1. Mathematical Models for Liquid- and Vapor-Dominated Hydrothermal Systems,
W79-06303 6A

Seminumerical Simulation of Singly Dispersive Convection in Groundwater,
W79-06394 2F

THERMOCLINE DYNAMICS

Modeling and Verification: The Two Indispensable Legs for Progress Toward Understanding and Management of Aquatic Systems as Demonstrated by a Study of Coastal Currents in Large Lakes,
W79-06179 2H

THERMOREGULATION

Behavioral Thermoregulation and Diel Activity in White Sucker (Catostomus Commersoni),
W79-06478 5C

THIN FILM VAPOR COMPRESSION

Thin Film Vapor Compression Saline Water Conversion System,
W79-06087 3A

TIDAL CURRENTS

Observations of Surface Tidal Components in Lower Cook Inlet Using a Two-Site HF Doppler Radar System,
W79-06188 5C

TIDES

Bristol Bay Oceanographic Processes (B-BOP),
W79-06192 5C

Modeling of Tides and Circulations of the Bering Sea,
W79-06203 5C

Norton Sound/Chukchi Sea Oceanographic Processes (N-COP),
W79-06211 5C

Ocean Tide and Waves Beneath the Ross Ice Shelf,
W79-06242 2L

Physical Oceanography,
W79-06452 5C

TIME SERIES ANALYSIS
Applications of Recursive Estimation Techniques to Time Variable Hydrological Systems,
W79-06251 2E

TITANIUM
Producing Permanently Hydrophylic Surfaces on Plastic Films for Solar Stills,
W79-06431 3A

TOXICITY
Study of Sulfate Pulp Mill Effluent Toxicity (Estudio de la toxicidad de los efluentes de una fabrica de pasta al sulfato),
W79-06128 5C

Comparison of Some Toxicity Indicators in a Study of the Effect of Pulp and Paper Industry Effluents on Pontogammarus Robustoides (GRIMM) (Sravnenie nekotorykh pokazatelei toksichnosti pri izvchenii vliyaniya stochnykh vod tsellyuloznobumazhnoi promyshlennosti na bokoplavov Pontogammarus robustoides (Grimm)),
W79-06132 5C

Acute Toxicity of Copper to Some Fishes in High Alkalinity Water,

SMITHSONIAN INSTITUTION, EDGEWATER, MD. CHESAPEAKE BAY CENTER FOR ENVIRONMENTAL STUDIES.
Assessing Non-Point Source Pollution. A Detailed Study of a Rural Watershed in the Coastal Plain of Maryland,
W79-06353 5B

SOCIETE RHONE POULENC TEXTILE PROGIL (FRANCE).
Treatment of Papermaking Effluents (Traitement d'effluents de papeteries),
W79-06131 5D

SOUTH CAROLINA UNIV., COLUMBIA. DEPT. OF GEOLOGY.
Dissolved Iron--An Indicator of the Groundwater Component of Small Streams Draining a Granite Terrain, South Carolina,
W79-06078 2E

Oil Spill Vulnerability of the Beaufort Sea Coast,
W79-06210 5C

SOUTH DAKOTA SCHOOL OF MINES AND TECHNOLOGY, RAPID CITY. ENGINEERING AND MINING EXPERIMENT STATION.
Inventory of Published and Unpublished Data on the Characteristics of Saline Surface and Ground Waters of South Dakota,
W79-06447 3A

SOUTHAMPTON UNIV. (ENGLAND). DEPT. OF GEOGRAPHY.
The Dynamics of a Drainage Network,
W79-06407 2A

SOUTHERN CALIFORNIA OCEAN STUDIES CONSORTIUM, LONG BEACH.
Marine Mammals,
W79-06461 5C

SOUTHERN RESEARCH INST., BIRMINGHAM, AL.
Development, Construction, and Testing of Osmionic Demineralizers,
W79-06084 3A

Determination of the Practicality of the Osmionic Process,
W79-06287 3A

High-Temperature Transference Numbers in Pure and Mixed Aqueous Electrolytes,
W79-06290 3A

SOUTHWEST RESEARCH INST., SAN ANTONIO, TX.
Investigation of the Use of Acoustic Vibrations to Improve Heat Transfer Rates and Reduce Scaling in Distillation Units Used for Saline Water Conversion.
W79-06288 3A

The Potential Contribution of Desalting to Future Water Supply in New Mexico,
W79-06428 3A

STANFORD UNIV., CA. DEPT. OF CIVIL ENGINEERING.
Geothermal Energy Development,
W79-06053 2F

STATE UNIV. OF NEW YORK COLL. AT BUFFALO. DEPT. OF BIOLOGY.
Interspecific and Seasonal Differences in the Temperature Tolerance of Stream Fish,
W79-06499 5C

STEARNS-ROGER CORP., DENVER, CO.
Second Annual Report, Saline Water Demonstration Plant No. 1, Freeport, Texas,
W79-06291 3A

STONE AND WEBSTER ENGINEERING CORP., BOSTON, MA.
Statistical Analysis of Sediment Motions of Dunes,
W79-06421 2J

SWEDISH METEOROLOGICAL AND HYDROLOGICAL INST., NORRKOPING.
Spatial Correlation of Hydrologic and Physiographic Elements,
W79-06405 2E

SYRACUSE UNIV., NY. DEPT. OF CHEMICAL ENGINEERING AND MATERIALS SCIENCE.
New Agents for Use in the Hydrate Process for Demineralizing Sea Water,
W79-06277 3A

SYRACUSE UNIV. RESEARCH INST., NY.
Further Properties of Hydrates and Hydrating Agents,
W79-06439 3A

TECHNION - ISRAEL INST. OF TECH., HAIFA. DEPT. OF CIVIL ENGINEERING.
Seminumerical Simulation of Singly Dispersive Convection in Groundwater,
W79-06394 2F

TECHNION - ISRAEL INST. OF TECH., HAIFA. FACULTY OF INDUSTRIAL AND MANAGEMENT ENGINEERING.
Instantaneous Unit Hydrograph with Negative Ordinates--Possible,
W79-06257 2E

TEL AVIV UNIV., (ISRAEL). SCHOOL OF ENGINEERING.
The Generalization of Darcy's Law for Nonuniform Flows,
W79-06080 2F

Models of Groundwater Flow in Statistically Homogeneous Porous Formations,
W79-06262 2F

TEMPLE BARKER AND SLOANE, INC., WELLESLEY HILLS, MA.
Economic Impact Analysis of a Trihalomethane Regulation for Drinking Water. MCL of THM at 0.10 Milligrams/Liter for Large Water Systems.
W79-06351 6E

TENNESSEE VALLEY AUTHORITY, KNOXVILLE.
A Geomorphic Model for Use in Streamflow Routing,
W79-06259 2E

TENNESSEE VALLEY AUTHORITY, MUSCLE SHOALS, AL.
Economic Assessment of FGD Sludge Disposal Alternatives,
W79-06041 5E

TERRAQUA APS, KALUNDBORG (DENMARK).
The Physics of Long Term Drawdowns in Pumping from Artesian Aquifers,
W79-06404 2F

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF OCEANOGRAPHY.
Oceanographic Processes in a Beaufort Sea Barrier Island-Lagoon System: Numerical Modeling and Current Measurements,
W79-06208 5C

THESSALONIKI UNIV., SALONIKA (GREECE). FACULTY OF TECHNOLOGY.
Unsteady Groundwater Flow on Sloping Bedrock,
W79-06256 2F

TORONTO UNIV. (ONTARIO). DEPT. OF CHEMICAL ENGINEERING AND APPLIED CHEMISTRY.
Rates of Leaching of Radium from Contaminated Soils: An Experimental Investigation of Radium Bearing Soils from Port Hope, Ontario,
W79-06400 5B

TRACOR, INC., AUSTIN, TX.
Effects of Impressed Electrostatic Fields on the Salt Water/Air Interface,
W79-06271 3A

TRINITY COLL., DUBLIN (IRELAND). DEPT. OF ZOOLOGY.
The Effect of the Rate of Change of Temperature on the Resistance of Asellus Aquaticus (L.) to High Lethal Temperatures,
W79-06491 5C

UNDERGROUND SURVEYS CORP., FRESNO, CA.
TV Inspection Locates Libyan Water Well Problems,
W79-06004 7B

UNION OIL CO. OF CALIFORNIA, BREA.
Union Oil Company of California's Geothermal Sampling Techniques,
W79-06061 2F

UNIVERSAL DESALTING CORP., NEW YORK.
Pilot Plant Tests and Design Study of a 2.5 MGD Horizontal-Tube Multiple-Effect Plant.
W79-06093 3A

UNIVERSAL OIL PRODUCTS, INC., SAINT PAUL, MN. JOHNSON DIV.
Here's How Liners Saved Two Problem Wells,
W79-06019 8C

UNIVERSITE SCIENTIFIQUE ET MEDICALE DE GRENOBLE (FRANCE). INST. DE MECANIQUE.
A Note on Estimating Finite Difference Interblock Hydraulic Conductivity Values for Transient Unsaturated Flow Problems,
W79-06255 2F

UNIVERSITY COLL. OF NORTH WALES, MENAI BRIDGE. MARINE SCIENCE LABS.
The Distribution of Organic Material and Trace Metals in Sediments from the River Liffey Estuary, Dublin,
W79-06239 2L

UNIVERSITY COLL. OF SWANSEA (WALES). DEPT. OF GEOLOGY AND OCEANOGRAPHY.
The Hydrodynamics and Sedimentology of a High (Tidal and Wave) Energy Embayment (Swansea Bay, Northern Bristol Channel),
W79-06237 2J

UPPSALA UNIV. (SWEDEN). DEPT. OF ANALYTICAL CHEMICSTRY.
On the Peroxodisulphate Oxidation of Total Nitrogen in Waters to Nitrate,
W79-06030 5C

UTAH STATE UNIV., LOGAN. DEPT. OF CIVIL AND ENVIRONMENTAL ENGINEERING.
Salinity Transport Between Layers of a Stratified Shear Flow,
W79-06106 2H

VALTION TEKNILLINEN TUTKIMUSKESKUS, OTANIEMI (FINLAND). REAKTORILABORATORIO.
Analysis of Settling Basin Operation in the Pulp and Paper Industry (Metsaeteollisuuden jaetevesien selkeytysaltaat),
W79-06121 5D

VANDERBILT UNIV., NASHVILLE, TN.
Theory of Clarifier Operation. II. Hindered Settling of Flocculating Systems in Rectangular Clarifiers,
W79-06113 5D

Theory of Clarifier Operation. III. Sludge Blanket and Upflow Reactor-Clarifiers,
W79-06114 5D

VERMONT UNIV., BURLINGTON.
The Relation of Soil Characteristics to the Failure of Domestic Waste-Water Disposal Systems,
W79-06165 5D

VERMONT UNIV., BURLINGTON. WATER RESOURCES RESEARCH CENTER.
Phosphorus Interactions in the Aquatic Environment: A Survey of the Literature,
W79-06109 5B

VIENNA UNIV. (AUSTRIA). INST. OF METEOROLOGY AND GEOPHYSICS.
Simple Non-Linear Models for the Cooling of Well-Mixed Rivers,
W79-06396 2A

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. CENTER FOR ENVIRONMENTAL STUDIES.
Mode of Elemental Dissipation from Ash Basin Effluent,
W79-06265 5A

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF GEOLOGICAL SCIENCES.
Ocean Tide and Waves Beneath the Ross Ice Shelf,
W79-06242 2L

VIZGAZDALKODASI TUDOMANYOS KUTATO INTEZET, BUDAPEST (HUNGARY).
Experiments Aimed at the Removal of Phosphate by Electrochemical Methods,
W79-06033 5D

VOLCANI INST. OF AGRICULTURAL RESEARCH, BET-DAGAN (ISRAEL). INST. OF SOIL AND WATER.
Efficient Amendment Use in Sodic Soil Reclamation,
W79-06150 5G

VSESOYUZNYI-NAUCHNYI PLANOVII OTDEL BUMAZHNOI PROMYSHLENNOST, MOSCOW (USSR).
Purification of High-Ash Wastewaters in Flotation Savealls (Ochistka vysokozol'nykh stochnykh vod na flotatsionnykh lovushkakh),
W79-06142 5D

WAIKATO UNIV., HAMILTON (NEW ZEALAND). DEPT. OF EARTH SCIENCES.
Induced Channel Instability and Hydraulic Geometry of the Mangawhara Stream, New Zealand,
W79-06416 2E

WASHINGTON UNIV., SEATTLE. DEPT. OF CIVIL ENGINEERING.
Forecasting Seasonal Snowmelt Runoff: A Summary of Experience with Two Models Applied to Three Drainages in the Cascade Mountains of Washington,
W79-06047 2E

Incorporation of Forecasted Seasonal Runoff Volumes into Reservoir Management,
W79-06048 2E

WASHINGTON UNIV., SEATTLE. DEPT. OF OCEANOGRAPHY.
Current Measurements in Possible Dispersal Regions of the Beaufort Sea,
W79-06189 5C

Bristol Bay Oceanographic Processes (B-BOP),
W79-06192 5C

STD Measurements in Possible Dispersal Regions of the Beaufort Sea,
W79-06193 5C

The Interaction of Oil with Sea Ice in the Arctic Ocean,
W79-06212 5C

WASHINGTON UNIV., SEATTLE. DIV. OF MARINE RESOURCES.
Coastal Meteorology of the Alaskan Arctic Coast,
W79-06204 5C

WASHINGTON UNIV., SEATTLE. POLAR SCIENCE CENTER.
Dynamics of Near Shore Ice,
W79-06214 5C

WATER RESOURCES ENGINEERS, INC., WALNUT CREEK, CA.
Abatement of Deposition and Scour in Sewers,
W79-06369 8A

WEIR WESTGARTH LTD., LONDON (ENGLAND).
Chamber Geometry in Multi-Stage Flash Evaporators.
W79-06438 3A

WEST VIRGINIA UNIV., MORGANTOWN. DIV. OF FORESTRY.
Energy Budget Evaluation of the Transpiration-pF Relationship in a Young Pine Forest,
W79-06069 2D

WESTINGHOUSE ELECTRIC CORP., ORANGE, CA. WATER PROVINCE DEPT.
Annual Report (FY 1969), Roswell Test Facility Roswell, New Mexico,
W79-06281 3A

WESTINGHOUSE RESEARCH AND DEVELOPMENT CENTER, PITTSBURGH, PA.
Thin Film Vapor Compression Saline Water Conversion System,
W79-06087 3A

WHITELEY-JACOBSEN AND ASSOCIATES, SEATTLE, WA.
Assessing Nitrogen Contamination by Use of Differential Temperature Calculations,
W79-06034 5A

WILLIAMS AND WORKS, GRAND RAPIDS, MI.
Investigation of the Feasibility of Tertiary Treatment of Municipal Wastewater Stabilization Pond Effluent Using River Wetlands in Michigan,
W79-06383 5D

WISCONSIN UNIV.-MILWAUKEE. CENTER FOR GREAT LAKES STUDIES.
Modeling and Verification: The Two Indispensable Legs for Progress Toward Understanding and Management of Aquatic Systems as Demonstrated by a Study of Coastal Currents in Large Lakes,
W79-06179 2H

WOODWARD-CLYDE CONSULTANTS, SAN FRANCISCO, CA.
Geothermal Effluents, Their Toxicity and Prioritization,
W79-06054 5B

YALE UNIV., NEW HAVEN, CT. SCHOOL OF FORESTRY AND ENVIRONMENTAL STUDIES.
Hydronomic Analysis: A Method for Regional Analysis of Economic and Water Resources Relationships,
W79-06001 6B

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

SELECTED WATER RESOURCES ABSTRACTS

The Library of the
OCT 4 19
University of
at Urbana Champa

VOLUME 12, NUMBER 14
JULY 15, 1979

W79-06501--W79-07000
CODEN:SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 12, NUMBER 14
JULY 15, 1979

W79-06501--W79-07000

ie Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the ansaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

elected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent nographs, journal articles, reports, and other publication nats. The contents of these documents cover the water-ted aspects of the life, physical, and social sciences as l as related engineering and legal aspects of the charac-stics, conservation, control, use, or management of water. ch abstract includes a full bibliographical citation and a set lescriptors or identifiers which are listed in the **Water sources Thesaurus.** Each abstract entry is classified into fields and 60 groups similar to the water resources re-arch categories established by the Committee on Water sources Research of the Federal Council for Science and chnology.

RSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE PIES OF DOCUMENTS ABSTRACTED IN THIS JOUR-L. Sufficient bibliographic information is given to enable ders to order the desired documents from local libraries other sources.

lected Water Resources Abstracts is designed to serve scientific and technical information needs of scientists, gineers, and managers as one of several planned services the Water Resources Scientific Information Center RSIC). The Center was established by the Secretary of the erior and has been designated by the Federal Council for ience and Technology to serve the water resources com-nity by improving the communication of water-related search results. The Center is pursuing this objective by co-dinating and supplementing the existing scientific and tech-al information activities associated with active research d investigation program in water resources.

provide WRSIC with input, selected organizations with tive water resources research programs are supported as enters of competence" responsible for selecting, abstract-ing, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

THE WATER BUDGET AND POTENTIAL WATER RESERVES OF THE EAST AFRICA SOURCE REGION OF THE NILE,
McGill Univ., Montreal (Quebec). Dept. of Meteorology.
E. Vowinckel, and S. Orvig.
Journal of Applied Meteorology, Vol. 18, No. 2, p 148-155, February 1979. 2 fig, 8 tab, 7 ref, 1 append.

Descriptors: *Hydrologic budget, *Africa, *Potential water supply, *Water resources, Rivers, Lakes, Watersheds(Basins), Rainfall, Precipitation(Atmospheric), Runoff, Evaporation, Swamps, Land use, Irrigation, Agriculture, Vegetation, Vegetation effects, Radiation, Solar radiation, Evapotranspiration, Model studies, Hydrology, Effects, Meteorology, Climatology, *Nile River.

An energy budget model was used, with daily synoptic surface and upper air data from 4 stations in East Africa, to calculate all terms of the surface energy balance once for each day and each night of 1973. The calculated evaporation was combined with precipitation values to give estimates of water surplus or deficit for a variety of natural regions. The surface included is the main source region of the White Nile, the study comprising the drainage area down to Nimule on the border of Sudan. The average outflow there is about 22 x 10 to the 9th power cu m/year, and the investigation attempted to estimate the effects on this outflow, and the amount of water potentially available for irrigation, by chaning certain surface parameters in the energy budget model. These surface parameters described the vegetation density, the soil types as characterized by water holding capacity, and surface slope. Lake Victoria is sufficiently large to generate its own air circulation and a precipitation maximum. Nevertheless, the lake does not enhance the regional outflow because of the high evaporation rate. The smaller lakes have substantial negative water budgets, as would be the case for all man-made reservoirs. The mountain regions contribute more than 60% of the total annual runoff from the land area. By a number of changes in the surface parameters in the model, a series of estimated values were obtained of the water potentially available for irrigation and the resulting altered outflow in the Nile at Nimule. EQUATIONS OF VOLUME AND SALT BALANCES OF BRINE PONDS,
Moscow Highway Inst. (USSR).
N. A. Kartvelishvili, and S. S. Remizova.
Water Resources, Vol. 4, No. 6, p 935-940, November-December 1977. 3 fig, 10 ref. Translated from Vodnye Resursy, No. 6, p 168-173, November-December 1977.

Descriptors: *Brines, *Ponds, *Model studies, Mathematical models, Salts, Water balance, Salt balance, Precipitation(Atmospheric), Evaporation, Storage, Underground storage, Mathematics, Monte Carlo method, Equations, Brine ponds, Salt dilution.

In the 1950s in the USA and later in England, France, USSR, and other countries, the method of storing petroleum, petroleum products, and gas in underground storage reservoirs leached out in rock-salt deposits began to be developed. The product stored in the reservoirs is displaced by a salt solution, for the preparation and storage of which open surface brine ponds are created. For normal operation of underground reservoirs and to avoid their dissolution and collapse, the brine pond should contain a required volume of solution of a certain concentration during the entire year, regardless of the weather conditions. However, as was shown by investigations conducted on experimental industrial brine ponds and in special open storages, the solution stored under various climatic conditions in the Tadzhik, Ukrainian, and Armenian SSR, and also near the city of Valdai, during the year undergoes considerable changes both in volume and in concentration of salts as a consequence of freezing, evaporation, precipitation of salt, dilution by atmospheric precipitation, etc. In this case, the salt concentration on the surface of the brine pond varies from the initial concentration of 318 g/liter required for operation to 5-10 g/liter with considerable vertical stratification. The concentration and volume of the solution in the brine pond can be controlled by adding new portions of solution. To determine the additional volume of solution and its concentration, it is necessary to solve the equations of the volume and salt balances of the brine pond. (Sims-ISWS)
W79-06611

TERRITORIAL DISTRIBUTION OF THE RELATIONSHIPS BETWEEN COMPONENTS OF WATER AND HEAT BALANCES,
Akademiya Nauk SSSR, Moscow. Inst. Vodnykh Problem.
V. V. Kulakov, and E. I. Breslav.
Water Resources, Vol 4, No 6, p 821-827, November-December 1977. 4 fig, 1 tab, 12 ref. Translated from Vodnye Resursy, Vol 6, p 29-37, November-December 1977.

Descriptors: *Heat balance, *Water balance, *Distribution patterns, Precipitation(Atmospheric), Moisture, Evaporation, Radiation, Solar radiation, Heat, Heat transfer, Analytical techniques, *USSR.

A rather distinct regularity was observed in the territorial distribution of components of water and heat balances. This regularly is due mainly to the zonal character of the distribution of the incoming short-wave solar radiation and precipitation. The effect of other physiographic factors on the normal distribution of components of water and heat balances is comparatively small. This makes it possible to construct generalized relations for large territories between precipitation, evaporation, and maximum possible precipitation, which is determined mainly by the radiation balance. The purpose of this work was to determine these relations for the plains of the European and Asiatic territories of the USSR. (Sims-ISWS)
W79-06616

SIMULATED STREAMFLOW RESPONSE TO POSSIBLE DIFFERENCES IN TRANSPIRATION AMONG SPECIES OF HARDWOOD TREES,
Northeastern Forest Experiment Station, Durham, NH.
C. A. Federer, and D. Lash.
Water Resources Research, Vol. 14, No. 6, p 1089-1097, December, 1978. 8 fig, 4 tab, 17 ref.

Descriptors: *Streamflow, *Transpiration, Hydrologic cycle, Model studies, Simulation analysis, Hardwood, Forest watersheds, Watershed management, Evapotranspiration.

Possible differences in transpiration among species of hardwood trees were simulated in a hydrologic model, called Brook, to estimate the effects of these differences on monthly and annual streamflow. Brook is a deterministic, lumped-parameter model that simulated streamflow from small, forested watersheds in the eastern United States. The model uses only daily mean temperature and daily precipitation as input. A 4-week difference in timing of leaf-development in spring or color change in autumn caused differences of 10-60 mm in simulated annual streamflow. When daily transpiration varied by 20%, as it might with differences in leaf diffusive resistance among species, differences in simulated streamflow ranged from 15 to 120 mm annually. Differences in root distribution with depth can affect the availability of soil water; varying this availability caused differences in simulated streamflow of 15-60 mm. In all cases the smaller differences occurred when the soil was dry at the time of differing transpiration. On a deep residual soil the differences in streamflow were spread through the year, but on a shallow till soil the differences were restricted to the months in which there were changes in transpiration. Differenences in response among 15 degrees north-facing and 15 degrees south-facing slopes and a horizontal surface were minor. (Skogerboe-Colorado State)

RATES OF WEATHERING AND SOIL FORMATION ON GRANITE IN RHODESIA,
Science and Education Administration, Coschocton, OH.
L. B. Owens, and J. P. Watson.
Soil Science Society of America Journal, Vol. 43, No. 1, p 160-166, January-February 1979. 7 fig, 7 tab, 30 ref.

Descriptors: *Weathering, *Watersheds(Basins), *Africa, *Soil surveys, *On-site investigations, Geomorphology, Soils, Water quality, Runoff, Soil formation, Soil analysis, Geochemistry, Rocks, Analysis, Calcium, Sodium, Potassium, Magnesium, Aluminum, Silica, Cations, Streamflow, Rain water, Sands, Silts, Clays, Hydrogen ion concentration, Soil horizons, Foreign countries, Foreign research, *Rhodesia, *Rusape watershed(Rhodesia), *Juliasdale watershed(Rhodesia).

Rates of weathering and soil formation on granite were studied in two areas of Rhodesia using small watersheds. The Juliasdale watershed of 0.91 sq km is hilly and has a mean annual rainfall of 1,220 mm. The Rusape watershed of 7.33 sq km is more nearly level and has a mean annual rainfall of 920 mm. Streamflow was measured in the two catchments over a period of at least 7 years. Streamwater, rainwater, soil, and rock samples were analyzed for Ca, Mg, K, Na, Si, and Al. The rate of granite weathering was calculated using Barth's equation which links the rate of weathering to the amount of an element removed in solution per unit time, its concentration in the rock, and its concentration in the weathered product. Sodium and Ca were the elements used in the Barth equation. The weathering rates in the Juliasdale and Rusape watersheds were estimated at 400 and 150 kg/ha per year, respectively, or 15.4 and 5.8 mm/1000 years. The concepts of C. E. Marshall and J. F. Haseman as well as S. W. Buol include changes in bulk density during the weathering process and give soil formation rates more acceptable than those of Barth. Thus, the rate of soil formation was found to be 11.0 mm/1000 years in the Juliasdale watershed and 4.1 mm/1000 years in the Rusape watershed. (Humphreys-ISWS)

The multi-faceted and intricately interwoven nature of the processes of desertification have long complicated attempts to unravel their causes from their effects. Three fundamental questions emerge in this endeavor: (1) to what degree is the inherent variability of climate, possibly coupled with climatic change and human activity, responsible for desertification, (2) can the ecological evidence for desertification be untangled from a morass of observational problems, temporal uncertainties as to trend, and ambiguities as to the areal extent of afflicted regions, and (3) what are the human dimensions, the causal mechanisms and the human impacts, of desertification. Water resource development has for long been hampered by the extreme climatic variability inherent to the arid regions and contemporary desertification is the result of this variability, including drought cycles, and the increasing pressures exerted by man upon the land and vegetation. Agricultural endeavors, both irrigated and rainfed, have frequently upset the precarious balance of nature in many of the worlds deserts, with waterlogging and increasing salinity resulting. Emphasis is placed by these authors, upon the needs to understand and cope with desertification, to minimize the ecological impact of resource use to avoid contributing to these destructive processes and to assist individuals and groups affected by desertification. Accordingly, the corrective measures offered here take many forms, but all stem from a concern for human systems as the central focus of desertifications causes and consequences. (Tickes-Arizona)

Mountain configuration, elevation distribution, river patterns, soil types, and irrigation systems were described for the test site (mountain region of the Syrdar'ya River basin in the northern part of the Fergana Depression). Mean-diurnal, mean-monthly, and mean-multiannual discharge data were given for the flows of the most important rivers. Springs and streams were described as to their numbers and total yield. Typical vegetation in the various soils was described by region. (Sims-ISWS)

SUPPORT OBSERVATIONS FOR WEATHER MODIFICATION OPERATIONS IN THE SAN JUAN MOUNTAINS AND A PROCEDURE FOR ESTIMATING SNOWPACK RUNOFF,
Western Weather Consultants, Inc., Durango, CO.
L. M. Hjermstad, and R. A. Mendenwaldt.
Final Report No. WWCI FR-003, January 1979. 46 p, 3 fig, 7 tab, 6 ref, 1 append. 7-07-83-V0005.

Descriptors: *Precipitation(Atmospheric), *Meteorology, *Weather data, *Weather modification, *Cloud seeding, *Snowpacks, *Snowmelt, Runoff, Runoff forecasting, Streamflow forecasting, Rainfall, Rainfall intensity, Rain gages, San Juan Mountains(Colorado), Environmental Data Network.

Surface precipitation measurements from the San Juan Mountains of Southwestern Colorado were obtained to expand and continue the Project Skywater data base for precipitation measurements. Field work involved the calibration, installation, weekly collection of the data, and maintenance of six recording precipitation gages. The data obtained were reduced, quality checked, and put into a computer compatible format. The usefulness of the Bureau of Reclamation's Environmental Data Network (EDN) was evaluated for cloud seeding operations. The most limiting constraint of the EDN was the availability of data at a consistent time. The programs available on the EDN were extremely valuable for evaluating weather modification potential. Wintertime precipitation and runoff relationships in the San Juan Mountains were analyzed and an equation was developed which could forecast by mid-May the runoff from the winter's snowpack to within 5% of the actual runoff observed. A STUDY OF RAINFALL PATTERN IN RELATION TO CROP PLANNING OVER THE HARYANA STATE,
Haryana Agricultural Univ., Hissar (India).
O. P. Bishnoi, and K. K. Saxena.
Indian Journal of Meteorology, Hydrology and Geophysics, Vol 29, No 3, p 501-507, July 1978. 7 fig, 2 tab, 1 ref.

Descriptors: *Rainfall, *Distribution patterns, *Crops, Precipitation(Atmospheric), Climates, Weather, Variability, Monsoons, Climatic zones, Climatology, Meteorology, Agriculture, *India, *Haryana State(India).

Haryana State receives a range of 200 to 1200 mm of annual rainfall in 7 agroclimatic zones. The rainfall patterns of these zones were discussed, with special reference to the amount, variation, and probabilities based on the rainfall data of the rain-recording stations. The existing cropping patterns were analyzed at block level in relation to rainfall pattern, variability, etc. (Sims-ISWS)

STATISTICS OF RAINFALL OVER PATHS FROM 1 TO 50 KM,
Politecnico di Milano (Italy).
G. Drufuca, and R. R. Rogers.
Atmospheric Environment, Vol. 12, No. 12, p 2333-2342, 1978. 9 fig, 8 tab, 15 ref, 2 append.

Descriptors: *Rainfall, *Statistics, *Model studies, Mathematical models, Weather data, Precipitation(Atmospheric), Storms, Distribution patterns, Spatial distribution, Rain gages, Probability, Rainfall disposition, Rainfall intensity, Weather, Meteorology, Rainfall over paths, Path length.

Ten years of data from the tipping-bucket raingage of the McGill Observatory, Montreal, were analyzed using the synthetic storm technique to generate statistics of rain along paths ranging from 1 to 50 km in length. For each rain event and for every path length considered, the mean and mean-square rain rate were calculated. These were then employed to obtain the standard deviation and the uniformity of the rain for each event and every path. Probability distributions of these quantities were compiled, and their dependence on path length was noted. The tendency for uniform structure is strong on short paths, but it decreases with increasing path length. Probability distributions of rain rate were calculated for paths of various lengths, conditioned by the path-average rate. These distributions can be used in applications in which there is a nonlinear dependence on rainfall rate, such as electromagnetic interactions with rain and the scavenging of pollutants. For paths up to 10 km in length, the modal value of rain rate was found to be equal to the path-average rate for all combinations of path length and average rate. With increasing path length, a second mode corresponding to zero rain rate or very weak rain becomes increasingly important and eventually dominant. Approximately half of the total variance of spatial fluctuations in rain rate is accounted for by scales shorter than 8 km. (Sims-ISWS)

STATISTICAL DISTRIBUTION OF DIFFERENT CUMULATIVE PERIODS OF RAINFALL IN HARYANA,
Haryana Agricultural Univ., Hissar (India).
O. P. Bishnoi, and K. K. Saxena.
Indian Journal of Meteorology, Hydrology and Geophysics, Vol 29, No 3, p 528-534, July 1978. 5 fig, 2 tab, 8 ref.

Descriptors: *Rainfall, *Distribution, *Statistics, Precipitation(Atmospheric), Distribution patterns, Curves, Frequency curves, Histograms, Equations, Probability, Agriculture, Crops, Monsoons, Meteorology, Climatology, *India, *Haryana State(India).

The statistical distribution of the accumulated rainfall for one, two, three, four, six, eight and sixteen weeks commencing from the onset of the southwest monsoon (25th standard week) was studied in respect of a low rainfall station, Hissar, and high rainfall station, Ambala in the Haryana State. The study of rainfall distribution indicated that up to a cumulative period of four weeks skewness is very high and, therefore, normal distribution cannot be fitted. In such cases gamma distribution was fitted and found satisfactory. Whereas beyond four weeks cumulative period, normal distribution was found satisfactory. Probability charts were prepared using the theoretical distribution to study their behavior with respect to crop planning. (Sims-ISWS)

CHARACTERISTICS OF SHORT PERIOD RAINFALL IN GUJARAT,
Meteorological Office, Poona (India).
N. N. Khambete, and B. C. Biswas.
Indian Journal of Meteorology, Hydrology and Geophysics, Vol. 29, No. 3, p 521-527, July 1978. 3 fig, 4 tab, 4 ref.

Descriptors: *Rainfall, *Distribution patterns, *Variability, Temporal distribution, Spatial distribution, Precipitation(Atmospheric), Frequency, Monsoons, Crops, Agriculture, Climatology, Meteorology, *India, *Gujarat State(India), Short-period rainfall.

Weekly rainfall of 30-70 years for one station in each of 15 districts in the dry land tract of Gujarat State was studied. The assured amounts of rainfall that may be expected to be exceeded in 30 and 50% of the years were shown. The distribution of dry and wet weeks during the monsoon season was examined. In general, the number of wet weeks varied from 2 to 12 in each year during the monsoon season and the remaining were dry weeks. The average number of wet weeks increased from west to east. The mean length of a wet spell also increased from 2 weeks at Bhuj to 3 weeks at Dohad. Mean length of a dry spell in monsoon varied from 3 to 2 weeks. (Sims-ISWS)

MAJOR CLIMATOLOGICAL DISCONTINUITIES IN THE MONTHLY MONSOON ACTIVITY IN THE NEIGHBORHOOD OF THE WESTERN GHATS,
Institute of Tropical Meteorology, Poona (India).
D. A. Mooley.
Indian Journal of Meteorology, Hydrology and Geophysics, Vol 29, No 3, p 508-514, July 1978. 1 fig, 3 tab, 2 ref.

Descriptors: *Rainfall, *Temporal distribution, *Distribution patterns, Networks, Rain gages, Precipitation(Atmospheric), Monsoons, Climates, Variability, Mountains, Effects, Meteorology, Climatology, *India, *Western Ghats(India), Climatological discontinuities.

The major climatological discontinuities in the monsoon activity from July to August and from August to September in the neighborhood of the Western Ghats were studied in detail on the basis of a close network of raingage stations, and the role of the Western Ghats was examined. The criterion used for defining the major climatological discontinuity was based on the quartiles of the monthly rainfall distribution. The Western Ghats appear to play a differential role. Since meteorological conditions are most favorable during July and become progressively less favorable with the advance of the summer monsoon season, the Western Ghats enhance rainfall substantially under favorable conditions, and decrease the rainfall substantially under relatively unfavorable conditions, and thus contribute to the major climatological discontinuities. (Sims-ISWS)

THE DEVELOPMENT OF ORGANIC ICE NUCLEI GENERATORS FOR WEATHER MODIFICATION,
Denver Research Inst., CO. Cloud Physics Lab.
N. Fukuta, M. N. Plooster, J. A. Armstrong, A. Gorove, and J. R. Butz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 952, Price codes: A07 in paper copy, A01 in microfiche.
Final Report, Volume I, NSF/RA-770136, June 1977. 140 p, 37 fig, 5 tab, 68 ref, 4 append. NSF ENV73-02910.

Descriptors: *Weather modification, *South Dakota, *Cloud seeding, *Equipment, Rainfall, Cloud physics, Nucleation, Aircraft, Weather, Meteorology, Climatology, Organic ice nuclei, Generators.

The development of prototypes of ground and airborne organic smoke generators was addressed. The center of the program reported involved the development of three kinds of organic ice nuclei generators. Two supporting studies, one on the performance of supersonic nozzles to optimize the nozzle design, and the other on ice nucleation mechanisms of organic smoke particles using a new thermal diffusion chamber, were also discussed. Also, a prototype generator tested in cumulus clouds in South Dakota showed encouraging effects of seeding. (Sims-ISWS)

PREHISTORIC PALAEOECOLOGY OF THE SAHARA ATLANTIC COAST IN THE LAST 10,000 YEARS: A SYNTHESIS,
Centre Univ. de Luminy, Marseille (France). Lab. de Geologie du Quaternaire.
N. Petit-Maire.
Journal of Arid Environments, Vol 2, No 1, p 85-88, March 1979. 1 fig, 9 ref.

Descriptors: *Paleoclimatology, *Archaeology, Recent Epoch, Dating, Droughts, Quaternary period, Climatic data, Arid climates, Invertebrates, Mammals, History, Sahara, Morocco, Mauritania, Coasts, Deserts, Littoral.

Results of recent interdisciplinary studies of the remains of Quaternary prehistoric sites and Holocene human occupation along the present Atlantic coast between Morocco and Mauritania point to a decrease in aridity around 3500 BP. This synthesis of the invertebrate fauna, large mammalian fauna, palaeobotany, archaeological context, and human remains suggests a slight decrease in aridity between 3000 and 4000 BP, with sedentary life in the Sahel extension zone up to 20-21N, and semi-sedentary occupation further north. Differences in the continuity and density of sites are correlated mainly with the littoral profiles and/or with the proximity to water-holes or wells. It is speculated that prehistoric inhabitants switched from a hunting-gathering economy during faunal optimas to a predominantly seafood gathering activity during the most unfavorable arid periods. SATELLITES AS AN AID TO WATER RESOURCE MANAGERS,
National Environmental Satellite Service, Washington, DC.
D. F. McGinnis, Jr., R. A. Scofield, S. R. Schneider, and C. P. Berg.
Presented at American Society of Civil Engineers, Convention and Exposition, held in Boston, MA, on April 2-6, 1979. 23 p, 11 fig, 1 tab, 18 ref.

Descriptors: *Satellites(Artificial), *Water resources, *Remote sensing, Flood, Precipitation, Hurricanes, Snow, Ice breakup, Rivers.

The National Oceanic and Atmospheric Administration (NOAA) currently operates two different satellite systems, the NOAA polar-orbiting satellites and the GOES system of geostationary satellites. The two GOES satellites currently operational are stationed over the equator at 75W and 135W longitude, respectively. Examples of satellite data applications to water resource problems are presented to draw attention to a current source of data often overlooked by water managers. Although spatial and temporal constraints exist, satellite data can contribute useful information toward solutions of mesoscale and macroscale water resource problems; e.g., areal snow cover determinations, river ice, flood extent, and short-term precipitation estimates. Satellites are a valuable source of remotely sensed data whose potential as a water resource management tool needs to be more extensively appreciated by the engineering community and more extensively developed by the hydrologic community. ON HEAT AND MASS FLUX THROUGH DRY SNOW,
Oslo Univ. (Norway). Dept. of Mechanics.
E. Palm, and M. Tveitereid.
Journal of Geophysical Research, Vol 84, No C2, p 745-749, February 20, 1979. 6 fig, 1 tab, 11 ref.

Descriptors: *Snow, *Heat flow, *Convection, *Mathematical models, Model studies, Analytical techniques, Analysis, Theoretical analysis, Water vapor, Thermal properties, Mass transfer, Porous media, Boundary processes, Thermal convection.

The conditions for obtaining thermal convection in dry snow were examined. It was shown that thermal convection will occur in dry snow layers with strong vertical temperature gradients and large air permeabilities (i.e., old snow). Thermal convection will lower the insulating power of the snow and increase the flux of water vapor through the snow layer. It will also lead to a pronounced decrease in snow density in the lower part of the snow layer and an increase in snow density in the upper part of the snow layer. Thermal convection may be important for the rate of formation of depth hoar. The magnitude of the heat and mass flux in convection was computed for several values of the Rayleigh number. MODELLING ICE DISSIPATION IN EASTERN LAKE ERIE,
State Univ. of New York at Buffalo. Dept. of Civil Engineering.
R. R. Rumer, Jr., and P. M. Yu.
Journal of Great Lakes Research, Vol 4, No 2, p 194-200, June 1978. 3 fig, 1 tab, 15 ref. NOAA 2-35281, 03-6-022-35236.

Descriptors: *Lake Erie, *Great Lakes, *Ice cover, *Lake ice, *Model studies, Mathematical models, Heat transfer, Iced lakes, Ice loads, Meteorological data, Climatic data, Analytical techniques, Ice, *Niagara River, Ice dissipation, Ice thickness.

A previously developed mathematical model, which considered both the heat exchange processes at the air-ice interface and the ice transport rate via the Niagara River, was used to simulate the ice dissipation process in eastern Lake Erie. The model, which assumed the ice thickness to be constant over the lake, has been further developed to take into account variable ice thickness. Buffalo meteorological data were used for the computation of the net heat exchange at the air-ice interface. Results of the model application illustrated the relative importance of in-lake ice melt to ice transport via the Niagara River during the dissipation period. Model results were found to give reasonably good agreement with the limited ice information available for the 1976 dissipation period. (Sims-ISWS)

AN EXPERIMENTAL STUDY OF BRINE DRAINAGE AND CONVECTION IN YOUNG SEA ICE,
Washington Univ., Seattle. Dept. of Oceanography.
T. M. Niedrauer, and S. Martin.
Journal of Geophysical Research, Vol. 84, No. C3, p 1176-1186, March 20, 1979. 17 fig, 1 tab, 14 ref. ONR NR 307-252, N00014-76-0234.

Descriptors: *Sea ice, *Brines, *Laboratory tests, Ice, Sea water, Ice-brine systems, Ice-water interfaces, Desalination, Equipment, Photography, Convection, Temperature, Channels, Oceanography.

In a series of experiments using a 1.6-mm-thick freezing tank, thin sections of salt water ice were grown which exhibit the same drainage features as natural sea ice. The tank design permitted photographs to be taken, while thermocouples mounted in the tank walls recorded the temperature profiles within the ice. Convection was observed in both the skeletal layer and in the brine channels by the flow of dyed brine. Flow in the skeletal layer was cusplike in appearance, consisting of narrow downflow regions separated by broad upflow regions. Above the skeletal layer, several brine channels were also usually present in the ice, and convective overturning occurred in these channels. The convection caused temperature fluctuations of 0.05 deg C, which calculations show increase the vertical heat flux by 1%. The brine drainage channels, which were usually sloped 30 deg to 60 deg to the horizontal, always had isotherms tilted from 0 deg to 13 deg in the same direction. The brine channels move both horizontally and vertically through the ice by melting their lower walls and freezing on the upper walls. An analysis based on the heat flux due to brine channel convection showed that convection can drive these wall movements. Observations suggested that most of the brine movement in the channels is caused by recirculation of water from below the ice. On a small scale, the formation of brine pockets from brine tubes also was observed. (Sims-ISWS)

ICE GROWTH STUDIES IN DULUTH-SUPERIOR HARBOR 1974-75,
Minnesota Univ. -Duluth.
R. T. Clapper Jr., D. Smith, K. Stortz, and M. Sydor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 170, Price codes: A04 in paper copy, A01 in microfiche. Report, September 5, 1975. 68 p, 39 fig, 3 tab, 8 ref, 2 append. NOAA 04-5-022-13..

Descriptors: *Lake ice, *Great Lakes, *Harbors, *Lake Superior, Ice, Ice loads, Ice cover, Heat budget, Physical properties, Model studies, Mathematical models, On-site investigations, Water temperature, Radiation, Solar radiation, Lakes, Navigation, *Duluth-Superior Harbors.

This study concerned the investigation of the ice growth and heat budget in the Duluth-Superior Harbor. The Harbor, located at the extreme western end of Lake Superior, is one of the major shipping ports on the Great Lakes. It is ice bound from mid December to mid April, causing cessation of interlake shipping in the winter months. Interest in the extension of winter shipping has gained lately in light of recent economical considerations for transportation of coal and oil along the Great Lakes. Initial investigations on the feasibility of winter shipping in Duluth resulted in installation of an experimental bubbler system which was devised to keep the channels open in the early winter to facilitate shipping of iron ore and movement of vessels into the Harbor for repair and modification. The limited bubbler installation in Howards Bay, 1973-74, for instance, proved to be quite successful in retarding ice growth. However, the physical principles governing the ice growth in the Harbor are complex and are not well understood. Thus, problems arising in ice growth forecasting, design, and construction of ice retarding methods, and evaluation of the environmental implications of winter shipping require a detailed investigation on the physical processes and the heat budget for the entire Harbor. EVAPOTRANSPIRATION BED DESIGN,
Goodson (Raymond L.) Inc., Dallas, TX.
A. F. Beck.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 105, No. EE2, Technical Note, p 411-415, April 1979. 1 fig, 2 tab, 1 ref, 1 append.

Descriptors: *Evapotranspiration, *Soil disposal fields, *Beds, *Design, Water pollution, Underwater, Drains, Drainage, Septic tanks, Soils, Temperature, Rainfall, Lodging, Urbanization, Water uses, *Septic tank effluent, Experimental ET beds, Pan evaporation, Bare soil, St. Augustine grass.

Evapotranspiration beds are used in lieu of drain fields in disposing of septic tank effluent in areas where the soil can't absorb water or where water is absorbed so rapidly that there is a possibility of contamination of underground water. Twice daily field measurements of water depth in 12 experimental ET beds were made from April 1976-March 1977 in San Antonio, Texas. In addition, measurements were also made of temperature, rainfall, and pan evaporation. It was concluded that evapotranspiration beds ranging from 777 square feet to 1,295 square feet can serve two- to four-bedroom houses. The beds should be shallow to reduce construction costs and to take advantage of high evapotranspiration rates near the ground surface. Beds should be level, and the top of the bed should be mounded to keep rainwater from ponding over the bed. A thick grass growth on the surface of the bed is desirable but not necessary. Evapotranspiration beds function on rainy days, but they can not be used where the bed surface freezes. (Roberts-ISWS)

NATURAL FREEZE-THAW SEWAGE SLUDGE CONDITIONING AND DEWATERING,
Rush Engineering Services Limited, Listowel, Ontario.
R. J. Rush, and A. R. Stickney.
Environmental Protection Service, Ottawa, Canada. Technology Development Report EPS 4-WP-79-1, January 1979, 40 p, 4 fig, 12 tab, 24 ref.

Descriptors: *Freeze-thaw tests, *Sewage sludge, *Dewatering, Watersheds(Basins), Sewage lagoons, Activated sludge, Aerobic treatment, Anaerobic digestion, Biochemical oxygen demand, Chemical oxygen demand.

In 1975, an experimental program was initiated at the Wastewater Technology Centre (WTC), Burlington, with the overall objective of developing an engineering design method for natural freeze-thaw sewage sludge dewatering on drainage beds. This study reports on a laboratory investigation and preliminary design for a natural freeze-thaw sewage sludge process. Four types of sewage sludge (conventional waste activated, extended aeration waste activated, aerobically digested and anaerobically digested) were frozen, thawed and drained on bench scale drainage beds. The effect of various sludge addition rates on sludge dewatering characteristics and filtrate quality was evaluated and sludge freezing rate information collected. All of the sewage sludges investigated showed a marked improvement in dewaterability after freeze-thaw. The rate of sludge application had no discernible effect on the results over the range studied. FLOOD HAZARD INFORMATION: ANIMAS RIVER AND JUNCTION AND DRY GULCH CREEKS, DURANGO, COLORADO.
Army Engineer District, Sacramento, CA.
Prepared for The City of Durango and The Animas Regional Planning Commission, CO, May, 1977. 11 p, 10 fig, 20 plates, 4 tab.

Descriptors: *Cloudbursts, *Historic floods, *Flood data, *Animas River(CO), *Colorado, *Junction Creek(CO), *Dry Gulch Creek(CO), Floods, Flooding, Flood flow, Indirect flood measurement, Flood profiles, Storms, Flood recurrence interval, Flood stages, Peak discharge, Stage-discharge relations, Rivers, Floodways, Flood plains, Channels, Durango(CO), 100-year flood, 500-year flood.

This report details flood hazard information for a 9 mile study reach of the Animas River, as well as for Junction Creek (4 mi) and Dry Gulch Creek (1 mi) in the vicinity of the Town of Durango in Southwestern Colorado. Drainage areas for the three streams' study reaches are: Animas River-765 square miles, Junction Creek-39 square miles, and Dry Gulch Creek-4 square miles. Floodplain width ranges from about 1/8 mile for Junction and Dry Gulch Creeks to 1/2 mile for the Animas River. Commercial, residential, and agricultural development exists in the floodplain, and some future development is predicted. Streamflow data for the Animas River are from a U.S. Geological Survey gage near the U.S. Highway 550. No gage information is given for Dry Gulch and Junction Creeks. Flooding is caused by runoff from spring snowmelt, localized cloudburst storms and rainstorms. Obstructions to flood flow include trees, brush, streambank vegetation, and three major highway bridges. The greatest flood in history occurred in June, 1927, with a peak discharge of 20,000 cubic feet per second (cfs) on the Animas River. The most recent heavy flooding occurred in October, 1972 on Junction Creek. The 100-year flood would have a peak discharge of 24,000 cfs on the Animas River and the 500-year flood would discharge 40,500 cfs. Average 100-year flood velocity of flow for the three streams could reach as high as 13 feet per second (fps) for the main channel and 4 fps for the overbank areas. (Arnold-NC)

FLOOD HAZARD INFORMATION: COLORADO RIVER, PALISADE, COLORADO.
Army Engineer District, Sacramento, CA.
Prepared for The Town of Palisade and Mesa County, CO., November 1976. 5 p, 31 plates, 1 tab.

Descriptors: *Floods, Flood profiles, *Flood plains, *Colorado River(CO), *Colorado, *Palisade(CO), Flooding, Flood flow, Indirect flood measurement, Storms, Cloudbursts, Historic floods, Flood data, Flood frequency, Flood damage, Erosion, Rivers, Floodways, Channels, Flood protection, Flood plain zoning, Mesa County(CO), 500-year flood, 100-year flood.

This report details flood hazard information for that portion of the Colorado River in the vicinity of the Town of Palisade in Mesa County east of the City of Grand Junction in extreme Western Colorado. The length of the study reach is about 10 miles from Interstate Highway 70 downstream to State Road 32. Drainage area is about 8,800 square miles above Palisade. Flood plain width varies from about 1,500-3,000 feet. Some residential and commercial development exists in the flood plain, although primary use is agricultural. Development is projected to be very slow, with a 10% increase projected by the year 2000. Causes of flooding are heavy spring, summer and fall rainstorms, and runoff from spring snowmelt. The most recent major flood occurred in 1957, although the 1884 flood is considered the area's most serious event. Major obstructions to flow include trees, brush and vegetation along the streambank, as well as highway bridges. Flood profiles are presented for the 100- and 500-year floods. The 100-year flood could cause the Colorado River to be out of its banks for almost the entire study area but would remain mostly within its natural flood plain; the 500-year flood would follow much the same pattern but would be deeper. Channel velocities of the 100-year flood would cause severe bank erosion. No structured control measures exist in the study reach; Mesa County has adopted flood plain regulations and Palisade has zoning ordinances but they do not address flood hazards. (Arnold-NC)

SYNTHESIS OF FLOW-DURATION CURVES FOR UNREGULATED STREAMS IN NEW HAMPSHIRE,
New Hampshire Univ., Durham. Inst. of Natural and Environmental Resources.
S. L. Dingman.
Water Resources Bulletin, Vol. 14, No. 6, p 1481-1502, December 1978. 6 fig, 5 tab, 19 ref. OWRT A-040-NH (1), 14-31-0001-4029.

Descriptors: *Streamflow, *Variability, *Flow duration, New Hampshire, Curves, Streams, Watersheds(Basins), Data processing, Analytical techniques.

Flow-duration curves are concise pictures of flow variability at a point on a stream, and they provide essential information for all water resource planning. In New Hampshire, useful estimates of flow-duration curves for ungaged points on unregulated streams can be made using only information readily available from contour maps: (1) area of the basin above the point of interest; and (2) either the measured mean basin elevation or the elevations of the highest and lowest points in the basin. Measured or estimated mean basin elevation then is used in regression equations to estimate mean flow Q(mean) and the flow exceeded 95% of the time, Q sub 95. Q(mean) was assumed to occur at the 27% exceedance frequency. Q sub 02, Q sub 05, and Q sub 30 were estimated as multiples of Q(mean). Equations were provided for calculating 95% confidence intervals for future estimates using the method. The dependence of mean flow on elevation is due to positive vertical precipitation gradients and negative vertical evapotranspiration gradients. The dependence of Q sub 95 on elevation appears to be due largely to the fact that it rains more often, that snowmelt takes longer, and that evapotranspiration is reduced at higher elevations. A PLANNING ALGORITHM TO ASSESS THE IMPACT OF URBAN GROWTH ON FLOOD EXPECTANCY,
Colorado State Univ., Fort Collins. Coll. of Forestry and Natural Resources.
M. E. Smith, and D. O. Doehring.
Hydrological Sciences Bulletin, Vol 23, No 2, p 245-255, June 1978. 6 fig, 2 tab, 12 ref. OWRT B-147-COLO(2).

Descriptors: *Urbanization, *Flood frequency, Methodology, Analytical techniques, New England, Urban runoff, Algorithms, Regression analysis, Drainage area, Land use, Mathematical studies, *Flood expectancy, Urban growth impact, Morphometric parameters.

Standard engineering and planning practice regarding flood hazard delineation in the U.S. are based on the assumption that a 100-year flood is static and that it is not affected significantly by subsequent urbanization of the basin. Research reported in the paper demonstrated that this assumption is unjustified when hydrological response of a basin to extensive urban growth depends on geological and morphometric parameters. The causal relationships were synthesized into an algorithm which predicts the change in discharge in 50- and 100-year floods on the basis of indices of urban land use changes, surficial properties of the catchment, and the configuration of the drainage network. The algorithm was developed by a stepwise multiple regression technique, and it utilized data from 18 basins in southeastern New England. (Singh-ISWS)

EXTERNALITIES FROM URBAN GROWTH: THE CASE OF INCREASED STORM RUNOFF AND FLOODING,
Iowa Univ., Iowa City. Inst. for Economic Research.
J. R. Bernard.
Land Economics, Vol. 54, No. 3, p 298-315, August 1978. 3 fig, 1 tab, 27 ref. OWRT A-053-IA and B-055-IA (4) (1).

Descriptors: *Urbanization, *Flooding, *Urban-runoff, Iowa, Storm runoff, Flood damage, Property values, Watersheds(Basins), Model studies, Mathematical models, Econometrics, Flood plains, Social costs, Cost-benefit analysis.

Expansion of Iowa City, Iowa, has increased the runoff and flood hazard in nearby Ralston Creek watershed, and the flood hazard has negatively affected property values in the lower portion of the watershed. Hydrological and economic evidence thus shows that urban growth produces a negative externality in the form of increased flood hazard to downstream properties, primarily because of increases in the area of impervious surfaces, as well as a negative income distribution effect. Since estimated social costs from hazards of urbanization are relatively small compared with large and costly flood control or diversion schemes, such projects would involve unfavorable benefit-cost ratios. Upstream urban development should be controlled to avoid further increases in runoff, and older properties subject to flooding should be converted to uses compatible with the level of flood hazard, such as parks or parking lots. Detailed cost-benefit analysis would be needed to assess options. New design and planning methods for storm runoff control show promise of cost savings over conventional methods, while at the same time solving urban runoff problems. Two severe floods have occurred in the watershed in recent years, the latest in 1972. The influence of flood hazard was measured by an econometric model of property values. (Lynch-Wisconsin)

EFFECTS OF DRAINAGE PROJECTS ON SURFACE RUNOFF FROM SMALL DEPRESSIONAL WATERSHEDS IN THE NORTH CENTRAL REGION,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
I. D. Moore, and C. L. Larson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-295 796, Price codes: A11 in paper copy, A01 in microfiche. Water Resources Research Center, University of Minnesota, Bulletin 99. January 1979. 225 p, 40 fig, 9 tab, 110 ref, 7 append. OWRT B-122-MINN (1), 14-31-0001-6092.

Descriptors: *Surface runoff, *Wetlands, *Drainage, *Flood flows, Low flows, Watershed model, *Small watersheds.

Surface runoff from small watersheds characterized by numerous depressions was studied statistically and by use of a special purpose watershed model. The statistical analyses illustrated the possible magnitude of the storage effect exhibited by lakes, marshes and other depressions. Because of data limitations statistical techniques could not be used to examine the effects on flood runoff of draining these same areas. The model represents

the processes of snowmelt, infiltration, soil moisture storage, evapotranspiration, subsurface and surface runoff for four different land drainage conditions, with or without channel development. Application of the model to two small watersheds in Jackson County, Minnesota indicated that drainage development increases annual runoff, storm runoff and peak discharge. The physical characteristics of the main water course in the watershed was the major factor influencing peak discharge at the watershed outlet. Examination of annual flood flows on the Minnesota River at Mankato suggests that downstream effects of drainage development on large watersheds are much less than indicated by this study on small watersheds. Downstream effects and flooding within a watershed are discussed in general terms.

ON THE NUMERICAL COMPUTATION OF TWO-LAYER NEARLY HORIZONTAL FLOWS,
Seaconsult Marine Research Ltd., Vancouver (British Columbia).
D. O. Hodgins.
Journal of Hydraulic Research, Vol. 17, No. 1, p 23-41, 1979. 8 fig, 1 tab, 12 ref.

Descriptors: *Stratified flow, *Model studies, *Analytical techniques, Mathematical models, Analysis, Mathematical studies, Stability, Subcritical flow, Flow, Laboratory tests, Hydraulic models, Waves(Water), Water levels, Numerical analysis, Methodology, Estuaries, Lakes, Two-layer flow, Finite difference method.

An implicit finite difference method was described for solving the equations of motion of a two-layer stably stratified fluid in one dimension. The computational scheme is applicable to smoothly varying subcritical flows and is formulated in terms of layer transport and thickness in order to optimize computer efficiency. Stability analyses of the method show that waves forming at the grid scale are undamped and two approaches for controlling this wave growth were discussed. Comparisons with experimental data show the method to be accurate provided that the natural long wave motions are well resolved and the grid scale waves are filtered from the solutions. Numerical tests indicate a minimum of 20 points per wave length or period can be considered as a lower limit for resolution. (Humphreys-ISWS)

NEW INTERPRETATION OF SOME HEAD LOSS-FLOW VELOCITY RELATIONSHIPS FOR DEFORMABLE MOVABLE BEDS,
Grenoble-1 Univ. (France). Inst. de Mecanique.
J. P. Chollet, and J. A. Cunge.
Journal of Hydraulic Research, Vol. 17, No. 1, p 1-13, 1979. 9 fig, 8 ref, 3 append.

Descriptors: *Head loss, *River beds, *River flow, Velocity, Friction, Hydraulics, Sediment transport, Movement, Roughness(Hydraulic), Rivers, Dunes, Sands, *Movable beds, Deformable beds, Einstein method, Engelund method.

The roughness of movable beds, which are deformed by the formation of sand dunes, is not constant since bed topography is dependent on flow characteristics. The relationship between the energy dissipated by the flow and its average velocity deviates, therefore, from the quadratic form generally used to express hydraulically rough flow; nevertheless, it is possible to describe the general form of this relationship and then to determine its exact terms using the Einstein and Engelund methods. EVALUATION OF HYDROLOGIC MODELING TECHNIQUES FOR FOREST LAND MANAGEMENT PLANNING,
Washington State Dept. of Natural Resources, Olympia.
J. A. Ryan.
Water Resources Bulletin, Vol. 15, No. 2, p 461-472, April 1979. 5 fig, 2 tab, 16 ref.

Descriptors: *Hydrology, *Simulation analysis, *Forest management, *Evaluation, *Mathematical models, Planning, Timber harvesting, Environmental effects, Ecosystems, Discharge(Water), Equations, Streams, Water temperature, Multicycle system, Systems analysis, Water quality.

A growing concern for environmental quality paralleled with increasing demands on our forest resources has prompted the Washington State Department of Natural Resources to evaluate simulation modeling as a technique for analyzing management decisions in terms of their environmental effects. The evaluation focused on a system of integrated models developed at the University of Washington which simulate processes and activities within the forest ecosystem. A major part of the system is a hydrologic model which predicts changes in discharge, stream temperature, and concentrations of suspended sediment and dissolved oxygen based on information generated by other models representing intensive management practices. The evaluation consisted of applying the system to a 72,000 acre watershed and determining the pertinence of hydrologic modeling for management purposes. Results show several potential uses of hydrologic modeling for forest management planning, especially for analyzing the effects of timber harvesting strategies on water quality. (Bell Graf-Cornell)

THE EFFECTS OF THE 1975-76 DROUGHT ON GROUNDWATER AND AQUIFERS,
Institute of Geological Sciences, London (England). Dept. of Hydrogeology.
J. B. W. Day, and J. C. Rodda.
Proceedings of the Royal Society of London, Series A, Vol. 363, No. 1712, p 55-68, 1978. 10 fig, 11 ref.

Descriptors: *Droughts, *Europe, *Water level fluctuations, *Water storage, Water shortage, Water levels, Precipitation, Aquifers, Hydrographs, Water wells, Withdrawal, Surface-groundwater water relationships, Base flow, Ground water recharge, Conjunctive use, England.

Approximately one-third of the water used for public supply in England and Wales is ground water. During the 1975-76 drought, water levels and storage in the major aquifers, the Chalk and the Triarsic sandstones, generally declined. In unconfined aquifers levels were a few meters below normal, but in confined aquifers with less storativity, levels dropped more than 10 meters. By August, 1976, record low levels were being registered in many wells due possibly to the effect of pumping. Water levels in some aquifers, particularly the Chalk, did not respond immediately to precipitation at the end of the summer. By the spring of 1977, ground water levels were at or above those of the previous four years, except in areas with previous overdraft. No permanent or long-term adverse physical or chemical effects on the aquifers have been noted thus far. Exploitation of ground water in deep storage during a drought would be difficult due to high cost, limited drilling facilities, deterioration of quality, decreases in stream baseflow, and possible reduction in well yield due to decreased permeability. Conjunctive use of surface and ground water and use of poor-quality water from shallow aquifers for non-potable purposes are more promising drought prevention measures. (Purdin-NWWA)

RUNOFF RAINFALL ANALYSIS FOR BARE SOILS,
Israel Soil Conservation and Drainage Div., Emek Hefer; and Weizmann Inst. of Science, Rehovoth (Israel). Computer Center.
J. Morin, and H. S. Jarosch.
Israel, Soil Erosion Research Station, Emek Hefer, Pamphlet No. 164, 1977, 22 p, 2 fig, 4 tab, 15 ref.

Descriptors: *Rainfall-runoff relationships, *Surface runoff, *Watershed managements, *Depth-area-duration analysis, *Surface-groundwater relationships, Storm runoff, Discharge(Water), Rainfall intensity, Runoff coefficient, Runoff forecasting, Time series analysis, Infiltration, Soil erosion, Vegetation effects, Soil conservation, Forecasting, Simulated rainfall, Design criteria, Infiltration rates.

A detailed quantitative analysis of rainfall-runoff relationships on small watersheds is of vital importance in soil conservation programs. A method is described here for predicting the quantity and discharge of runoff from cultivated areas which makes possible the analysis of real long-term rainfall data for a certain zone in order to obtain the synthetic runoff values on the basis of probability. Rainfall intensity data collected by the Israel Hydrological Service was computer-analyzed on the basis of relationships obtained from field experiments with rain simulation on characteristic soils and methods of cultivation. The prediction of runoff by the method described here is divided into and analyzed in three stages: (1) analysis of rain, (2) runoff under uniform infiltration conditions, and (3) runoff with varying infiltration rates of the soil. Results of analysis have shown that crust formation and wetting, and that for most soil types in the Mediterranean and other semiarid zones, runoff consists of surface flow with almost no components of underground horizontal flows. It is the opinion of these authors that the method of predicting discharge and runoff volume utilizing the combination of infiltration curves obtained by artificial rain systems together with the analysis of actual rain data, which they describe, is a promising approach for quickly obtaining design parameters which are based upon long-term probability. URBAN STORM WATER MANAGEMENT: DISTRIBUTION OF FLOOD VOLUMES,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
S-O. Chan, and R. L. Bras.
Water Resources Research, Vol. 15, No. 2, p 371-382, April 1979. 19 fig, 3 tab, 14 ref.

Descriptors: *Urban hydrology, *Storm water, *Flood volumes, *Frequency distribution, *Rainfall, Management, Overflow, Sewers, Hydrologic data, Hydrographs, Simulation analysis, Runoff, Equations, Intensity, Duration, Systems analysis, Joint probability density function, Closed analytical form, Annual exceedance series, Kinematic wave functions, Design.

The frequency distribution of the volume of water above a given threshold discharge is developed. This is done using basic and accessible information like the joint probability density function of rainfall intensity and duration together with expressions, to be derived, relating the volume of interest to rainfall intensity and duration. The resulting distribution function is in a closed analytical form containing only a few climatological and physical parameters of a catchment. This distribution function will be of great value in the design of storage devices, flood control systems, and storm water treatment facilities in urban areas. (Bell Graf-Cornell)

The 3 main characteristics that put the use of groundwater models into the class of intellectual toys are as follows. First, the wrong model is frequently chosen for problem-solving, of which overkill by use of an overly sophisticated model is an example. Secondly, the paying agency or client is often disillusioned with the model results because of frequent modeler oversell in the early stages of project planning and budgeting. Thirdly, the problems are often solved with a numerical code that is a mystery to all except the modeler himself. The 3 main characteristics that make groundwater models very practical tools are as follows. First, there is no doubt that the models of today can solve extremely complex groundwater flow problems. Second, the models of today are available to virtually everyone in the groundwater business. And third, having a computer code and data deck available is a perfect tool for transferring information to another person as to how a problem was solved. This paper also included a very brief description of the state-of-the-art of groundwater modeling and a very comprehensive reference list of useable models. (Visocky-ISWS)

NONSTEADY FLOW TO NONPENETRATING WELL,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
R. S. Kanwar, H. P. Johnson, and H. S. Chauhan.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol. 105, No. IR1, Proceedings Paper 14458, p 45-55, March 1979. 4 fig, 2 tab, 16 ref, 2 append.

Descriptors: *Aquifer characteristics, *Wells, *Unsteady flow, Aquifers, Drawdown, Hydraulic conductivity, Penetration, Hydraulics, Pump testing, Transmissivity, Flow, Steady flow, *Nonequilibrium flow, Well hydraulics.

A nonequilibrium formula was obtained to predict the nonsteady drawdown distribution near a cavity well discharging from a nonleaky artesian aquifer. A graphical method was suggested to find such aquifer properties as specific storage coefficient and hydraulic conductivity. The practical utility of this method was demonstrated by utilizing the pumping test data for a particular aquifer. The results of the pumping tests were given, and the values of hydraulic conductivity and specific storage were compared with the well-known method of Theis. If the values of aquifer properties are found to be satisfactory from this solution, the use of other methods that require the drilling of fully penetrating wells could be avoided easily, which will make the cost of investigation of aquifer properties reasonably small. (Lee-ISWS)

OBSERVATIONS OF THE SUBSURFACE WATER REGIME IN THE TERRITORY OF CZECHOSLOVAKIA,
H. Kriz, and I. Krizova.
Water Resources, Vol. 4, No. 6, p 952-956, November-December 1977. 1 fig, 1 tab, 4 ref. Translated from Vodnye Resusry, No. 6, p 187-192, November-December 1977.

Descriptors: *Subsurface waters, *Groundwater, *Wells, *Springs, Observation wells, Water wells, Water levels, Water supply, Water resources, On-site investigations, Precipitation(Atmospheric), Hydrologic data, Hydrology, Hydrogeology, *Czechoslovakia.

A study of the subsurface water regime in the territory of modern Czechoslovakia began later than hydrologic observations, mainly observations of the level of rivers. Single measurements of the discharge of certain large springs were made as long ago as 1881-1890, but systematic observations of the subsurface water regime for water supply and other water management purposes began only at the turn of the century. The fact is that purposeful observations were primarily irregular and brief. The sole exceptions are the long-term observations of the level of subsurface waters and discharge of springs which have been carried out since the turn of the century in the southern part of the Ceska Trebova Highlands. These observations in the territory of Czechoslovakia do not have an analogy, and from the viewpoint of duration are unique on a worldwide scale. Observations in 10 wells began as long ago as at the end of 1899 and in the ensuing years gradually encompassed other installations. Measurements of the discharge of the first two springs (Sulka spring in Brezov near the Svitava River and Nadrazin spring in the village of Brnenc) began in 1900. The results of these unique observations are of great value, because they permit judging the changes in the supply of subsurface waters in the indicated part of Czechoslovakia during 76 years. MORPHOLOGY AND WATER REGIME OF A DOTHAN SOIL,
Soil Conservation Service, Auburn, AL.
R. L. Guthrie, and B. F. Hajek.
Soil Science Society of America Journal, Vol. 43, No. 1, p 142-144, January-February 1979. 2 fig, 3 tab, 10 ref.

Descriptors: *Water levels, *Groundwater, *On-site investigations, *Perched water, *Alabama, Soils, Water level fluctuations, On-site tests, Methodology, Soil horizons, Measurement, Instrumentation, Precipitation(Atmospheric), Dothan soil, Mottled soils, Plinthite.

The water regime in a Dothan soil was characterized by installing piezometers at 137-, 183-, and 285-cm depths. Monthly water table measurements differed for each piezometer throughout a 4-year study period, indicating a perched water table. There was a water table at the greatest depth on only 5 occasions during the study period. On all but a few occasions, a water table was encountered at the 2 shallower depths. Morphological properties and seasonal precipitation were related to the water regime. The perched water table fluctuated in a continuous zone of saturation in the B horizon above the horizons containing appreciable amounts of plinthite. A discontinuous zone of saturation was bounded on the bottom by the B3 horizon. The piezometer that had perforations in the C horizon showed no water table, which indicated that a 'dry' zone exists between the perched and regional groundwater tables. Fluctuations in the depth to perched water corresponded to seasonal precipitation patterns. (Humphreys-ISWS)

THAT SINKING FEELING.
Ground Water Age, Vol. 13, No. 8, p 23-24, 42, April, 1979.

Descriptors: *California, *Land subsidence, *Artesian heads, Groundwater, Pumping, Damages, Flood control, Levees, Recharge, Compaction.

The central third of the Santa Clara Valley in California experienced one to eight feet of subsidence from 1934 to 1967 due to withdrawal of ground water from a confined aquifer. Changes in rate and magnitude of artesian head decline caused geographic variations in subsidence rate and magnitude with time. Subsidence has necessitated construction of levees near the coast, repairing damaged wells, railroads, bridges, and roads, establishing and releveling a bench mark network, and making private engineering surveys. To date, $15-20 million have been spent on these problems. Between 1967 and 1975 artesian head recovered 104 feet due to increased water imports, favorable local water supply, decreased pumpage, and increased recharge. The most significant factor was the increase of imports from 30,000 to 148,000 acre feet per year. The rate of subsidence decreased to a fraction of an inch per year as a result of the dramatic head recovery. Compaction is irreversible but by raising the artesian head in the aquifers until it equals or exceeds the maximum pore pressure in the aquitards, additional compaction and subsidence can be stopped. ON THE AQUIFER'S INTEGRATED BALANCE EQUATIONS,
Princeton Univ., NJ. Dept. of Civil Engineering.
J. Bear.
Advances in Water Resources, Vol. 1, No. 1, p 15-23, September 1977. 11 ref, append.

Descriptors: *Aquifers, *Balance equations, *Continuity equation, *Hydrodynamics, *Dispersion, Methodology, Transport phenomena, Porous media, Water flow, Solutes, Groundwater.

A general methodology is presented for describing transport phenomena in porous media at a macroscopic level. Then, these macroscopic balance equations are integrated (or averaged) along the vertical for confined, leaky and phreatic aquifers. The results are employed to derive (averaged) aquifer equations for the flow of water and of a solute (hydrodynamic dispersion). It is shown that in all cases, the resulting equation is identical to that derived on the basis of an assumption of horizontal flow (the Dupuit assumption). Macrodispersion, occurring at the aquifer level, is discussed and appropriate coefficients are proposed. (Bell Graf-Cornell)

GROUND-WATER LEVELS IN NEW MEXICO, 1976,
Geological Survey, Albuquerque, NM. Water Resouces Div.
J. D. Hudson.
New Mexico State Engineer Basic Data Report, 1978. 184 p, 35 fig, 56 tab.

Descriptors: *Groundwater levels, *New Mexico, *Water wells, *Water level fluctuations, *Hydrographs, Geologic units, Springs, Artesian heads, Groundwater resources, Bibliographies, Publications.

Water levels are measured periodically in a network of about 5,000 observation wells to record changes in ground-water storage in New Mexico. About 1,000 wells are measured annually and the remaining 4,000 wells are scheduled to be measured at 5-year periods, staggered so that a portion are measured each year. The areas of water-level observation are within seven of the nine major surface-water drainage basins; most are in areas where ground water is used in large quantities for irrigation, municipal, or industrial purposes. Measurements tabulated in this report were made in January through May 1977, except the Tatum-Lovington-Hobbs area in Lea and Chaves Counties, which has both 1977 and previously unreported 1976 water levels. Maps show water-level changes for most of the areas reporting 5-year water-level changes. The program of groundwater observation conducted by the U.S. Geological Survey is in cooperation with the State Engineer of New Mexico; resulting data are used in evaluating the ground-water resources of the State. Included is a bibliography of papers and publications pertaining to ground water in New Mexico published or released to the open file in 1976, with additions from 1873-1975. (Woodard-USGS)

FORMATION FINES AND FACTORS CONTROLLING THEIR MOVEMENT IN POROUS MEDIA,
Exxon Production Research Co., Houston, TX.
T. W. Muecke.
Journal of Petroleum Technology, Vol. 31, No. 2, p 144-150, February 1979. 11 fig, 1 tab, 5 ref.

Descriptors: *Wells, *Clogging, *Porous media, Migration, Fines, Sand aquifers, Unconsolidated aquifers, Sandstones.

Unconsolidated sandstone formations contain large amounts of very small, loose, solid particles that vary widely in size and chemical composition. These particles can concentrate at pore restrictions causing severe plugging and reductions in formation permeability. The effects of single-and multiphase fluid flow on fine-particle movement in porous media are discussed. The onset of water production can cause fines to move and lead to well productivity problems. Injection of water or solvent, surfactant solutions often leads to at least temporary removal of near-wellbore damage. Chemical systems designed to permanently remove or stabilize fine particles must be capable of treating a broad range of particles having widely different compositions. Besides mechanical bridging, particle wettability and surface/interfacial forces strongly influence particle mobility when multifluid phases are present. Particles will move only if the phase that wets them is moving. Thus, it may be possible to control fines movement with permanent coatings of the right material on sand grain surfaces. (Purdin-NWWA)

GROUNDWATER LEVELS AND PUMPAGE IN THE EAST ST. LOUIS AREA, ILLINOIS, 1972-1977,
Illinois State Water Survey, Urbana.
J. T. Emmons.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 043, Price codes: A03 in paper copy, A01 in microfiche. Circular 134, 1979. 23 p, 17 fig, 4 tab, 6 ref, 1 append.

Descriptors: *Groundwater, *Illinois, *Data collections, *Mississippi River, *Water levels, Discharge(Water), Groundwater resources, Water supply, Aquifers, Sand aquifers, Alluvial aquifers, Water table aquifers, Municipal water, Domestic water, Well data, Potentiometric level, Surface waters, Water wells, *Alton(IL), *Wood River(IL), *Granite City(IL), *National City(IL), *Monsanto(IL).

Groundwater levels and pumpage in the East St. Louis area from 1972 through 1977 were considered in this report. Large quantities of groundwater chiefly for industrial and municipal use were withdrawn from wells penetrating a sand and gravel aquifer along the valley lowlands of the Mississippi River. Groundwater pumpage decreased from 79.5 million gallons per day (mgd) in 1971 to 65.3 mgd in 1977. Of the total 1977 pumpage, 79% was industrial; 16% was for public water supplies; 3.7% was for domestic use; and 1.3% was for irrigation. Pumpage in the East St. Louis area is concentrated in 5 major pumping centers: the Alton, Wood River, Granite City, National City, and Monsanto areas. As a result of reduced groundwater pumpage, near normal precipitation, and high Mississippi River stages, water levels rose as much as 35 feet in the Monsanto area near the Mississippi River and 15 feet in the Alton area. As a result of decreased pumpage in one area and increased pumpage in another area, water levels in the Granite City area rose 5 feet in one location and declined 5 feet in another location. In the National City area, water levels rose 10 feet in one area and declined 10 feet in another area. In the Wood River area, water levels rose 20 feet in one area because an industry changed the location of its groundwater source. (Humphreys-ISWS)

NUMERICAL MODEL FOR LAND SUBSIDENCE IN SHALLOW GROUND WATER SYSTEMS,
California Univ., Berkeley. Lawrence Berkeley Lab.
T. N. Narasimhan, and P. A. Witherspoon.
Publication No. LBL-4461, December 1976. 10 p, 12 fig, 10 ref.

Descriptors: *Finite difference analysis, *Land subsidence, *Compaction, Aquifers, Groundwater, Porous media, Flow systems.

The finite difference method is employed to simulate compaction of aquifers due to withdrawal of ground water. The model combines a general three-dimensional fluid flow field with a one-dimensional, vertical deformation of the porous medium. The governing equation is solved using a mixed explicit-implicit iteration scheme for advancing in the time domain. The model can handle heterogeneous flow regions with complex geometry, and with time dependent variation of material properties and boundary conditions. Five hypothetical cases are provided to demonstrate the applicability of the model to the wide variety of conditions associated with land subsidence. (Purdin-NWWA)

APPROXIMATE ANALYSIS OF UPCONING,
Princeton Univ., NJ. Dept. of Civil Engineering.
H. Rubin, and G. F. Pinder.
Advances in Water Resources, Vol. 1, No. 2, p 97-101, December 1977. 3 fig, 4 ref.

Descriptors: *Upconing, *Saline water-freshwater interfaces, *Coastal aquifers, *Groundwater, *Flow, *Salinity distribution, Effects, Wells, Equations, Free surface flow, Unsteady state, Cylindrical coordinates, Pumping, Dispersion.

The change of the salinity distribution in coastal aquifers due to pumpage is often described as an upconing of the interface between saline and fresh water. Sea and fresh water are miscible fluids, however. Therefore, dispersion of salinity in the aquifer affects the upconing process. An estimate of the effect of salinity dispersion on the dynamics of the flow as well as on the salinity distribution in the aquifer is presented herein. The phenomenon is described as a migration of sharp interface perturbed by small disturbances due to salinity dispersion. The creation of the mixing zone between fresh and saline water is described as a formation of a boundary layer in the vicinity of the sharp interface. This method is primarily recommended for the flow fields in which simple representation of the sharp interface migration is obtainable. (Bell-Graf Cornell)

SIMULATION OF GROUNDWATER FLOW AND MASS TRANSPORT UNDER UNCERTAINTY,
Princeton Univ., NJ. Water Resources Program.
D. H. Tang, and G. F. Pinder.
Advances in Water Resources, Vol. 1, No. 1, p 25-30, September 1977. 3 fig, 11 ref.

Descriptors: *Groundwater, *Flow, *Simulation analysis, *Mass transport, *Uncertainty, Stochastic processes, Analytical techniques, Waves(Water), Probability, Wells, Equations, Systems analysis, Contaminant transport, Perturbation approach.

An analytical tool which facilitates the analysis of stochastic groundwater problems without resorting to Monte Carlo analysis can be developed using an approach analogous to that used in the field of applied mathematics to investigate the propogation of waves in random media. The fundamental as-

sumption of this approach is that the random part of the porous medium property is small compared to the non-random part. This assumption allows us to treat the problem of solving a partial differential equation with stochastic coefficients using perturbation theory. (Bell Graf-Cornell)

2G. Water In Soils

SURFACE STORAGE ON BEDDED CULTIVATED LANDS,
North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
G. A. Gayle, and R. W. Skaggs.
Transactions of the American Society of Agricultural Engineers, Vol. 21, No. 1, p 101-109, January-February 1978. 5 fig, 2 tab, 8 ref. OWRT-A-086-NC(5). 14-34-0001-7070.

Descriptors: *Storage, *Depression storage, *Runoff, *North Carolina, *Drainage, Soils, *Storage capacity, Infiltration, Evaporation, Surfaces, Water storage, Rainfall, Precipitation(Atmospheric), Agriculture, Farm management, On-site investigations, Hydrology, Micro-storage, Macro-storage.

Surface depressional storage was characterized for three field soils by measuring both micro and macro components at various times during the year. Measurements were made on both land formed and non-land formed fields. Micro-storage was measured by sealing the soil surface in small plots and determining the amount of water that could be applied before runoff began. The macro-storage component was measured by closely spaced surface elevation measurements. The range in macro-storage was from 1.1 mm for a land-formed soil to 33 mm for a natural sloped field. The micro-storage was dependent on soil type, slope, and time of year, but ranged from 0.6 to 19 mm. Based on the cases examined, flat lands in the North Carolina Tidewater Region may be expected to have macro-storage values of about 15 mm or greater under natural conditions. When potholes are eliminated, either by land forming or simply filling the depressions, macro-storage can be reduced to less than 5 mm. (Sims-ISWS)

SERIOUS INTERFERENCES IN THE DETERMINATION OF TRACE METALS IN SOILS BY FLAME AND FLAMELESS ATOMIC ABSORPTION SPECTROMETRY,
Montana Coll. of Mineral Science and Technology, Butte. Dept. of Chemistry.
A. Mubarak, L. Hageman, R. A. Howald, and R. Woodriff.
Soil Science Society of America Journal, Vol 42, No 6, p 889-891, November-December, 1978. 5 tab, 14 ref.

Descriptors: *Trace elements, *Spectrometers, Chemical analysis, *Soil chemistry, Absorption.

Negative interfering effects on the carbon rod atomizer (CRA) absorbances of Mn, Fe, and Ni were found to occur in the presence of the chlorides of the major cations (Ca, Mg, Na) in the soil solution. These interferences were corrected either by precipitation of the chlorides with silver nitrate or by incorporating a relatively high level of sulfuric or nitrice acid into the sample volume. Magnesium ion, irrespective of the associated anion, was found to lower the Cd signal on the CRA. High concentrations of MgSO4 caused lowering of the Mn signal when using air-acetylene flame. This lowering effect of MgSO4 was avoided upon using N2O-acetylene flame. No interferences were noticed for Mn and Zn when using the constant temperature furnace developed at Montana State University. (Skogerboe-Colorado State)

OXYGEN FLUX MEASUREMENT IN UNSATURATED SOILS,
Malcomess Ltd., Isando (South Africa).
J. M. Rankin, and M. E. Sumner.
Soil Science Society of America Journal, Vol 42, No 6, p 869-873, November-December, 1978. 3 fig, 3 tab, 12 ref.

Descriptors: *Oxygen, *Soil gases, Diffusion, Aeration, Deaeration, Oxidation-reduction potential, Electrodes, Instrumentation, Electrical resistance.

Because in unsaturated soil systems the plateau of the current-voltage curve is not well developed or is absent, O2 reduction at the platinum microelectrode is not diffusion controlled and consequently measured current depends continuously on applied potential. To overcome this difficulty an O2 flux meter was designed which carefully controls and measures the applied potential and enables the effective potential at the electrode to be measured precisely. The instrument, which has facilities for measuring soil electrical resistance, electrode redox potential, and O2 reduction current was fully described together with a circuit diagram. Because the surface oxide condition of the microelectrode is crucial to reproducible results, electrode pretreatment involving gentle abrasion in wet fine sand is necessary to standardize conditions prior to measurement. The results showed that the instrument is suitable for measuring O2 flux in unsaturated systems, and that measured current was closely related to soil airspace. (Skogerboe-Colorado State)

A UNIVERSAL DIMENSIONLESS PHOSPHATE ADSORPTION ISOTHERM FOR SOIL,
Arya-Mehr Univ. of Technology, Tehran (Iran).
A. Shayan, and B. G. Davey.
Soil Science Society of America Journal, Vol. 42, No. 6, p 878-882, November-December, 1978. 3 fig, 1 tab, 20 ref.

Descriptors: *Adsorption, *Phosphates, Isotherms, Kaolinite, Chemical potential, Fertilizers, Soil chemistry.

A unique dimensionless phosphate adsorption isotherm, covering the solution concentration range 0.000001 to 0.1M P, which has been found to fit 17 materials including 15 soils, pure kaolinite and amorphous Al(OH)3, was derived. The soils shown to fit the isotherm included chromic luvisols, pellic vertisols, calcic luvisols, a tropeptic eutrorthox, a volcanic ash soil from New Zealand, and a number of English soils. The necessary parameters to derive a complete adsorption isotherm for a particular soil, from the universal isotherm, required three adsorption experiments in the high concentration range (0.000001 to 0.0001M P) to define the linear portion of the isotherm and the critical concentration. Three other determinations in the range 0.000001 to 0.0001M P were needed to obtain the Freundlich isotherm from the data after correction for the effect of the linear region of the isotherm at high concentration. The advantage of this universal isotherm over conventional isotherms, is that it requires less experimental work to define and is applicable over a wide range of P concentrations such as might be found surrounding a fertilizer granule. VARIABLE DRAINABLE POROSITY IN DRAINAGE DESIGN,
Indian Agricultural Research Inst., New Delhi (India). Div. of Enginerring.
A. K. Bhattacharya, and R. S. Broughton.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol. 105, No. IR1, Proceedings Paper 14433, p 71-85, March 1979. 6 fig, 7 tab, 25 ref, 2 append.

Descriptors: *Drainage, *Soil water, *Porosity, On-site investigations, Laboratory tests, Soil moisture, Soil water movement, Water table, Water levels, Soils, Clays, Sands, Soil properties, Bulk density, Subsurface drainage, Tensiometers, Hydraulic transients, Hydraulic conductivity, Soil science.

Field and laboratory investigations were done to study the dependence of drainable porosity on the suction in two different types of soil. Empirical nonlinear relationships were developed between the two. These relations were different for the sand and the clay soils. The relations were integrated between various limits to obtain the volume of water drained from saturated soil columns for different water table drawdowns. The results thus obtained were used to derive water table, depth-transient water content relations for soil columns of known lengths. These relations can be used to predict water table depth from the known value of transient water content in a soil column, in the water balance approach for subsurface drainage design. The effect of depth of installation of subsurface drains on the soil moisture depletion in coarser soils was examined. (Sims-ISWS)

THE EFFECT OF DISCHARGE RATE AND INTERMITTENT WATER APPLICATION BY POINT-SOURCE IRRIGATION ON THE SOIL MOISTURE DISTRIBUTION PATTERN,
Agricultural Research Organization, Bet Dagan (Israel). Inst. of Soil and Water.
I. Levin, P. C. van Rooyen, and F. C. van Rooyen.
Soil Science Society of America Journal, Vol. 43, No. 1, p 8-16, January-February 1979. 9 fig, 4 tab, 14 ref.

Descriptors: *Soil water, *Irrigation, *Model studies, *On-site investigations, *Laboratory tests, Soil water movement, Diffusivity, Distribution patterns, Soil moisture, Hydraulic conductivity, Soils, Wetting, Mathematical models, Computer models, Water loss, Evaporation, Point-source irrigation, Trickle irrigation.

A comparison was made between the results of laboratory and field experiments regarding predictions of soil moisture distribution from a point source and those predictions theoretically calculated by a computer simulation model. Good agreement was found between computed and experimental data. When the verified model was used for predictions regarding soil water distribution under point-source irrigation, it was found that when the same total amount of water (12 liters) was added to the soil with a 2, 4, or 8 liters/hour continuously applied trickle source, a loss of 26% of the total amount applied was effected below the 60 cm depth after 12 hours. The initial water content of the soil was adjusted to the field capacity value. Under identical conditions, 1 liter/hour continuously applied and 2 liters/hour pulsed (intermittent) irrigation resulted in only a 12% loss. The lateral distribution of the water showed that in the first group of treatments, 80% of the water in the wetted soil volume was distributed 45 and 43 cm horizontally from the point source after 12 and 24 hours respectively. In the second group of treatments, the distribution was to 29 and 40 cm. Thus, the second group of treatments showed a clear advantage in reducing water loss under the root zone while still not significantly affecting the horizontal distribution. The pulse treatment, therefore, can replace the advantageous low (1 liter/hour) discharge rate while to a large extent avoiding the difficulties of blocking of outlets by maintaning a higher (2 liter/hour) discharge rate. (Sims-ISWS)

FLOW PATTERNS DURING EXTENDED SATURATED FLOW IN TWO, UNDISTURBED SWELLING CLAY SOILS WITH DIFFERENT MACROSTRUCTURES,
Soil Survey Inst., Wageningen (Netherlands).
J. Bouma, and J. H. M. Wosten.
Soil Science Society of America Journal, Vol. 43, No. 1, p 16-21, January-February 1979. 6 fig, 1 tab, 18 ref.

Descriptors: *Soils, *Soil water, *Laboratory tests, Soil water movement, Porosity, Pores, Clays, Saturated flow, Saturated soils, Data processing, Analytical techniques, Soil science, Breakthrough curves, Swelling soils, Soil columns, Soil macrostructure.

Large, undisturbed soil columns with an average height of 30 cm, a diameter of 25 cm, and with two different types of macrostructure were sampled in moist clay soil. Type 1 had vertical worm channels and 'rough' peds; type 2 had no worm channels and 'smooth' peds. Flow patterns were characterized by repeatedly measuring K sub sat and chloride breakthrough curves. Effective pore size distributions were calculated from the latter with the Klinkenberg procedure. Initial chloride breakthrough was most rapid in soil columns of type 1 after displacement of less than 1 vol. % of the initial water, whereas 3 vol. % was displaced in type 2. Rapid chloride breakthrough was associated with a high volume of immobile water (60 vol. % and 2 vol. % for types 1 and 2 respectively). These phenomena can be explained by the presence of relatively large, continuous pores (particularly in type 1), that occupy only a small volume, as was confirmed by micromorphometric analysis and calculations of effective pore diameters. Application of a gypsum crust on soil columns of type 1 erased the differences with type 2. Crusts induced pressure potentials of -5 mbar, thus excluding the largest pores only. Extended ponding and associated continued swelling of peds did not change flow phenomena in type 1; in type 2, K sub sat, the volume of immobile water and the effective pore diameters gradually decreased. Equivalent pore diameters, calculated from the soil moisture characteristic, were quite different from the effective diameters and could not be used to independently predict the breakthrough curves. EVALUATION OF CONCEPTUAL MODELS FOR DESCRIBING NONEQUILIBRIUM ADSORPTION-DESORPTION OF PESTICIDES DURING STEADY-FLOW IN SOILS,
Florida Univ., Gainesville. Dept. of Soil Science.
P. S. C. Rao, J. M. Davidson, R. E. Jessup, and H. M. Selim.
Soil Science Society of America Journal, Vol. 43, No. 1, p 22-28, January-February 1979. 6 fig, 4 tab, 23 ref. EPA R-803849.

Descriptors: *Pesticides, *Herbicides, *Soils, *Adsorption, Soil water, Soil water movement, Solutes, Model studies, Mathematical models, Laboratory tests, Pollutants, Path of pollutants, Water pollution, Soil science, Breakthrough curves.

Breakthrough curves (BTC) from miscible displacement of 2 pesticides through 3 soils were measured for 2 input concentrations of each pesticide. These BTC data were used to evaluate 2 conceptual models for describing the nonequilibrium adsorption-desorption of pesticides in soils under steady-state water flow conditions. In both models, adsorption on one group of sites was assumed to be instantaneous, while the rate of adsorption on the second group of sites followed either nonlinear reversible kinetics (Model I) or was a diffusion-controlled process (Model II). Parameters in both models were estimated by curve-fitting model predictions to one set of measured BTC data using a nonlinear least-squares optimization procedure. These parameter values then were used to verify the conceptual models by comparing simulated and measured BTC for a different input concentration. A different set of model parameters were required to describe the BTC data for each input concentration for the same soil-pesticide combination. The measured 3H20 BTC for all 3 soils were symmetrical in shape with no apparent tailing. Evaluation of Model I and II using these BTC suggested that the mobile-immobile water concept may not be applicable to the three soils used in this study. (Sims-ISWS)

SEASONAL WATER USE BY WINTER WHEAT GROWN UNDER SHALLOW WATER TABLE CONDITIONS,
Govind Ballabh Pant Univ. of Agriculture and Technology, Pantnagar (India).
B. C. Saini, and B. P. Ghildyal.
Agricultural Water Management, Vol 1, No 3, p 263-276, November, 1978. 10 fig, 1 tab, 27 ref.

Descriptors: *Water requirements, *Soil water movement, Shallow water, Moisture tension, Moisture content, Root zone, Tensiometers, Moisture deficit, *Wheat.

Techniques for estimating seasonal water use from soil profile water depletion frequently do not account for flux below the root zone. A method using tensiometers for obtaining evapotranspiration losses from the root zone and water movement below it was discussed. Soil water flux below the root zone was approached by a sequence of pseudo steady state solutions of the flow equation. Upward soil water flux contributed 36 to 73% to the total water requirement of winter wheat (Triticum aestivum L.) whereas soil water depletion accounted for 11 to 19% only. Water use efficiency with one irrigation during an early stage of plant development was greater than with no or three irrigations. This was the result of both decrease of resistance due to soil moistening and better root development. Tensiometer readings were also interpreted to estimate root zones, water table depths and soil moisture contents. Methods described in this paper can be used in determining seasonal water use by growing crops, replacing or supplementing lysimeter or meteorology approaches to this problem. CONVECTIVE TRANSPORT OF SOLUTES BY STEADY FLOWS 1. GENERAL THEORY,
Institute for Soil Fertility, Groningen (Netherlands).
P. A. C. Raats.
Agricultural Water Management, Vol. 1, No. 3, p 201-218, November, 1978. 3 fig, 1 tab, 10 ref.

Descriptors: *Soil water movement, Solutes, Convection, Steady flow, Theoretical analysis, Anisotropy, Travel time, Leaching.

A comprehensive theory describing convective transport of solutes was presented. The time required for a parcel of water to move from one point to another along a streamline was determined, and this basic information was then used to describe collections of parcels of water forming a surface. Input/output relationships were determined in terms of the distribution of the solute over the inflow and outflow surfaces. A simple geometric transformation was used to extend the theory to anisotropic media. (See also W79-06693) (Skogerboe-Colorado State)

CONVECTIVE TRANSPORT OF SOLUTES BY STEADY FLOWS II. SPECIFIC FLOW PROBLEMS,
Institute for Soil Fertility, Groningen (Netherlands).
P. A. C. Raats.
Agricultural Water Management, Vol. 1, No. 3, p 219-232, November, 1978. 5 fig, 31 ref.

Descriptors: Soil water movement, Solutes, Convection, Steady flow, Drainage, Leaching, Flow characteristics, Flow system, Travel time.

A comprehensive theory describing convective transport of solutes was presented in Part I (See W79-06692). In this paper the general theory was applied to specific flow problems. The relatively simple problem of leaching to drains and ditches induced by an input distributed uniformly over the surface was discussed in detail. If the ratio of the halfspacing between the drains or ditches and the depth to the impermeable layer is larger than about five, density distribution is approximately exponential. The general theory was also used to evaluate the literature on many other problems. (Skogerboe-Colorado State)
W79-06693

DETERMINATION OF THE APPARENT DISPERSION COEFFICIENT OF SOLUTES IN UNSATURATED SOIL,
Arkansas Univ., Fayetteville. Dept. of Agronomy.
R. F. Paetzold, and H. D. Scott.
Soil Science Society of America Journal, Vol. 42, No. 6, p 874-877, November-December 1978. 3 fig, 1 tab, 14 ref. OWRT A-039-ARK(1).

Descriptors: *Dispersion, *Solutes, *Soil water movement, Tracers, Laboratory tests, Moisture content, Radioisotopes, Pesticides, Herbicides, Unsaturated flow, Dispersion coefficients.

A method for determining the apparent dispersion coefficient of a solute in unsaturated soils at relatively low soil water flow rates was presented. Two soil cores with different initial water contents were joined, and water was allowed to flow between the soil cores for a specified time interval. The distribution of a radioactively tagged solute, initially present in one of the soil cores, subsequently was determined by freezing the cores in liquid air, sectioning the soil with a refrigerated microtome, and analyzing the soil sections for solute content using liquid scintillation techniques. Apparent dispersion coefficients could be determined either with or against the water flow. The solutes used in this study were tritiated water, chloride, and metribuzin (a herbicide). (Sims-ISWS)

WATER AND SALT MOVEMENT IN UNSATURATED FROZEN SOIL: PRINCIPLES AND FIELD OBSERVATIONS,
Science and Education Administration, Kimberly, ID. Snake River Conservation Research Center.
J. W. Cary, R. I. Papendick, and G. S. Campbell.
Soil Science Society of America Journal, Vol. 43, No. 1, p 3-8, January-February 1979. 6 fig, 1 tab, 18 ref.

Descriptors: *Soil water movement, *Unsaturated flow, *Soil temperature, *Infiltration, *Salts, Frost heaving, Heat flow, Mathematical model, Equations, Hydraulic conductivity, Theoretical analysis, Electrical conductance, Percolation, Model studies, Salt movement.

Soil temperatures, electrical conductivities, and water redistribution were measured at 4 field sites during a 30-day period in which the soil was never completely thawed. The soil on each site was a silt loam with varying aspects and vegetation covers. Both upward and downward flows of water and solutes were observed. The assumption that liquid water flow in frozen soil is analogous to unsaturated liquid flow in unfrozen soil, led to a simple equation that, in general, agreed with the field observations. The equation requires knowledge of the soil temperatures, the solute concentrations, and 2 constants that characterize the soil's water release curve and saturated hydraulic conductivity. Infiltration and frost heaving were discussed with respect to this simple theory. Water in frozen soil flows from high to low temperatures and from high to low salt concentrations. Consequently, solutes in eve very low salt soils are important in decreasing frost heave and increasing infiltration. The liquid flow is so closely coupled with temperature that heat flow must be considered simultaneously in any comprehensive analysis. This coupling, as expressed in the simple liquid flow equation, accounts for the effect of soil water content on frost heave rates and the effects of temperature on maximum heaving pressures. AN ATTEMPT AT EXPERIMENTAL VALIDATION OF MACROSCOPIC-SCALE MODELS OF SOIL MOISTURE EXTRACTION BY ROOTS,
Louvain Univ. (Belgium). Lab. of Soil Physics.
C. Belmans, J. Feyen, and D. Hillel.
Soil Science, Vol 127, No 3, p 174-186, March 1979. 12 fig, 33 ref.

Descriptors: *Soil moisture, *Model studies, *Root systems, *Water utilization, Resistance networks, Soil-water-plant relationships, Water table, Absorption, Equations, Hydraulic conductivity, Computer programs, Macroscopic-scale models, Root resistance, Ryegrass.

An experiment was conducted to test the validity of mechanistic simulation model describing the process of soil moisture extraction by root systems, and to assess the quantitative importance of root hydraulic resistance in this process. Close-growing stands of ryegrass were raised in tubes packed with sand and loam, with and without the presence of a water table. The pattern of water uptake was monitored by gamma-ray scanning and tensiometry. Correspondence between measured and independently predicted uptake patterns could be greatly improved by assigning a relatively high value of root resistivity. Further improvement of the mechanistic model's predictive capability may require explicit formulation of conductive (axial) resistance in addition to absorptive (radial) resistance, as well, perhaps, as such important subsidiary factors as aeration, mechanical impedance, and distribution of nutrients in the soil profile. (Visocky-ISWS)

BASF's lysimeter facility at Limburgerhof was 50 years old in 1977. Approximately 130,000 percolate samples from 232 outdoor plots have been removed and measured there to date. About 1.5 million analyses of substances in soil and percolate have been carried out, as have about 190,000 analyses of substances in crops. Thirty-nine publications on the subjects of fertilization and crop protection provide evidence of the comprehensive work in agricultural chemistry, as well as in crop and environmental protection. These publications discuss nutrient supply and nutrient behavior in the soil and their relation to the most varied growing conditions. The speed with which the substances migrate in the soil and their degradation are of special importance when studying the active ingredients of crop protection. The numerous results at Limburgerhof were summarized. (Sims-ISWS)

THE INFLUENCE OF ELECTROLYTE CONCENTRATION ON FLOCCULATION OF CLAY SUSPENSIONS,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
H. S. Arora, and N. T. Coleman.
Soil Science, Vol. 127, No. 3, p 134-139, March 1979. 1 fig, 5 tab, 20 ref.

Descriptors: *Electrolytes, *Clays, *Flocculation, *Suspension, *California, Dispersion, Clay minerals, Hydraulic conductivity, Alkaline soils, Illite, Kaolinite, Cations, Soils, Sodium adsorption ratio, Concentration.

The influence of mineralogical composition, saturating ions, and electrolyte concentration on the flocculation and dispersion behavior of various clay minerals was used to explain reductions in the hydraulic conductivity observed in many sodic soils containing little or no expandable clay minerals. Sodium-saturated clay minerals were found to differ in their sensitivity to flocculation by NaHCO3 in the decreasing order: illite, vermiculite, smectite, and kaolinite. Critical salt concentrations (CSC) were 185, 58, 28 to 60, and 8 me/liter, respectively, for the above clays. Very low concentrations of CaCl2 or MgCl2, on the order of 1 me/liter or less, were required to flocculate Ca- or Mg-saturated clays. At a sodium adsorption ratio of 15, CSCs were several times greater than those for CaCl2 or MgCl2. A small amount of smectite, possibly deposited on positively charged edges of kaolinite, was responsible for large increases in CSC values of kaolinite. The flocculation behavior of soil clays extracted from 4 California soils was influenced by their mineralogical composition, similar to the patterns observed for reference clay minerals. PERTURBATION SOLUTIONS FOR VERTICAL INFILTRATION PROBLEMS: A UNIFORMLY VALID SOLUTION,
City Coll., New York. Dept. of Mathematics.
D. K. Babu.
Advances in Water Resources, Vol. 1, No. 2, p 111-116, December 1977. 2 fig, 14 ref.

Descriptors: *Soil moisture, *Movement, *Vertical infiltration, *Perturbation, Equations, Iteration methods, Burgers equation, Unsaturated soils.

The high nonlinearities in the parabolic equations governing the movement of moisture in unsaturated homogeneous soils are a complication that is widely known and discussed in the literature. Herein, the problem of vertical infiltration is solved by means of perturbation methods. The structure of the solution exhibits uniform validity for all times and all depths. For comparison between prediction and an exact result, the Burgers equation has been selected. This equation is mildly nonlinear and hence constitutes the most unfavorably known example. SPECTRAL DISTRIBUTION OF RADIATION IN THE NORTHERN GREAT LAKES DURING WINTER,
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
S. J. Bolsenga.
Journal of Great Lakes Research, Vol 4, No 2, p 226-229, June 1978. 3 fig, 3 tab, 11 ref.

Descriptors: *Radiation, *Solar radiation, *Great Lakes, *Lake Superior, On-site investigations, Instrumentation, Measurement, Clouds, Atmosphere, Water vapor, Energy, Energy transfer, Ice, Melting, Radiation spectra, Spectral distribution.

Measurements of global radiation in the spectral bands 285-2800, 535-2800, 630-2800, and 700-2800 nm were collected at the eastern end of Lake Superior during the period January through May. Significant differences were reported between the various spectral bands on a monthly as well as on a daily and hourly basis, due to varying degrees and types of cloudiness. Values of net and downward radiation for the same period were also provided. (Sims-ISWS)

Journal of Great Lakes Research, Vol 4, No 2, p 186-193, June 1978. 3 fig, 2 tab, 19 ref. EPA R005169-01.

Descriptors: *Lake Superior, *Great Lakes, *Water chemistry, *Sediments, *Erosion, Clays, Sampling, Laboratory tests, Chemicals, Metals, Heavy metals, Dissolved solids, Suspended solids, Analytical techniques, Chemical analysis, Water pollution, Water pollution sources, Lakes, Limnology.

Inputs of chemical parameters were calculated from estimated erosion and resuspension data and by using experimental measurements of chemical releases from both bluff samples and Lake Superior sediments in suspensions with Lake Superior water. The ability of suspended clay particles to remove manganese and copper ions from Lake Superior water was investigated. The loadings of easily leachable dissolved solids, phosphorus, nitrogen, chloride, silica, sodium, potassium, calcium, magnesium, aluminum, and heavy metals from shoreline erosion and resuspended sediment were small compared to Lake Superior tributary inputs. Suspended sediment particles have a large capacity to remove copper and manganese ions from Lake Superior water. Each kilogram of suspended sediment particles of clay size can remove 175 mg of copper and 11 mg of manganese in Lake Superior water spiked to contain 10 microgram/L of each metal. (Sims-ISWS)

STATISTICAL ANALYSIS OF THE 1975 INTERCOMPARISON STUDY ON LAKE ERIE,
Ohio State Univ., Columbus, Dept. of Statistics.
P. I. Feder, and J. E. Zapotosky.
Journal of Great Lakes Research, Vol. 4, No. 2, p 127-133, June 1978. 6 tab, 5 ref. EPA R-802543-01.

Descriptors: *Lake Erie, *Great Lakes, *Sampling, *Laboratory tests, Statistics, Analysis, Chemical analysis, Nutrients, Phosphorus, Nitrogen, Nitrogen compounds, Nitrates, Nitrites, Silicates, Analytical techniques, Laboratories, Lakes, Limnology, Intercomparison studies.

An intercomparison experiment was carried out at two sampling stations on Lake Erie on June 10, 1975, by 3 laboratories that are conducting environmental monitoring programs on the lake. The laboratories simultaneously collected water samples from 3 sampling depths at each station. The samples were divided into thirds, 1/3 to be analyzed by each of the laboratories using their standard procedures. A number of physical, chemical, and biological properties were determined from each of the water samples. One of the principal results of the statistical analyses is that significant differences exist for most of the properties under study, due to which laboratory analyzed the samples. However, the effect due to which laboratory obtained the samples is much less important. These results are in direct agreement with results reported in 1974 by Robertson, Elder, and Davies. Descriptors: *Lakes, *Destratification, *Bubbles, *Model studies, Mathematical models, Mixing, Oxygen, Dissolved oxygen, Water quality, Reservoirs, Stratification, Epilimnion, Hypolimnion, Hydraulics, Limnology, Plumes, Bubble plumes, Air injection, Bubbling pressure.

Mathematical modeling and physical modeling make possible quantitative predictions as regards the destratification process brought about by the local injection of air at the bottom of a thermally stratified lake or reservoir. The mathematical model distinguished between a near field and a far field. Mixing of epilimnion water and hypolimnion water takes place in the near field. The mixing water is accumulated in the far field as an interlayer between epilimnion and hypolimnion. The influence of wind on the mixing is not considered. The agreement between theory and model experiments is satisfactory, but further measurements in nature are needed. Increasing the number of injection points is an effective means to speed up the destratification process. Increasing the air flow rate, however, is not. (Sims-ISWS)

LAKE SURFACE FLUCTUATIONS AND THE MASS FLOW THROUGH THE NARROWS OF LAKE WINNIPEG,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
B. C. Kenney.
Journal of Geophysical Research, Vol. 84, No. C3, p 1225-1235, March 20, 1979. 12 fig, 15 ref.

Descriptors: *Mass transfer, *Canada, *Water levels, *Lakes, Fluctuations, Currents(Water), Current meters, Tides, Flow, Temperature, Water temperature, Winds, Frequency, On-site investigations, On-site data collections, Data processing, Limnology, *Lake Winnipeg(Manitoba).

Lake Winnipeg is a large (23,000 sq km), shallow (12 m), homogeneous lake composed of two well defined basins separated by a central area of irregular geometry that includes the Narrows. Lake current was measured at 3 depths from 2 moorings in the Narrows and was compared with water level records from 7 gauges around the lake throughout the ice free season (May 15-October 15, 1976). The dominant lake response was a forced response produced by natural fluctuations in the wind with periods of 50-100 hours. Large amplitude water level and current fluctuations were produced by low wind speeds due to resonance caused by wind periodicity near the 39 hour natural co-basin oscillation of the lake. Although damping is subcritical, allowing for a resonant response, Lake Winnipeg is heavily damped compared to deep lakes. The co-basin oscillation is so low in frequency that a classical wind setup is unlikely to occur. Free oscillations were of secondary importance to the large-scale dynamicsj of the lake. Several shole lake modes higher than the first were identified from the current and water level records, but the amplitudes of these modes were very small compared to the free response of the Great Lakes. There was also a detectable response in the records at several natural frequencies of the individual basins and at the M sub 2 tide. (Sims-ISWS)

LOW-FREQUENCY CURRENT FLUCTUATIONS IN LAKE ONTARIO, WINTER 1972-1973 (IFYGL),
Wisconsin Univ.-Milwaukee. Center for Great Lakes Studies.
G. O. Marmorino.
Journal of Geophysical Research, Vol. 84, No. C3, p 1206-1214, March 20, 1979. 11 fig, 2 tab, 21 ref. NOAA 04-6-022-44026.

Descriptors: *Great Lakes, *Lake Ontario, *Currents(Water), On-site investigations, On-site data collections, Data processing, Lakes, Winter, Winds, Fluctuations, Variability, Temperature, Water temperature, Circulation, Water circulation, Limnology.

An analysis was presented of thelow-frequency (omega less than 0.6 cycles per day) current fluctuations in Lake Ontario, using measurements made at 15 and 75 m during the 1972-1973 winter. The data, collected as part of the International Field Year for the Great Lakes (IFYGL), were obtained at 9 stations: 1 near midlake and the other 8 spaced around the lake, about 50 km apart and 12 km from shore. Let U denote the alongshore velocity (positive leaving the shore to the right) and V the cross-shore velocity (positive offshore). It was found that (1) the standard deviation of V is approximately constant; (2) the standard deviation of U, which is about 2.4 times greater than that of V, may be depth independent and is less at the southern shore stations than at the shallower northern stations where the flow appears to be directly wind driven; (3) the velocity fluctuations are roughly aligned with the local orientation of the coastline; (4) the U fluctuations show much better mutual correlation than the V fluctuations, having an alongshore coherence length of about 250 km (nearly half the basin perimeter); (5) the U signal shows high coherence for periods of about 10-25 and 4-5 days; and (6) the computation of lagged correlations shows the U fluctuations to propagate in a counterclockwise sense from the northern shore at a rate of about 42 km/d(0.5 m/s), which implies a period of about 13 days for a complete circuit around the lake. These results provided additional evidence for the existence of topographic Rossby waves (shelf waves) in Lake Ontario, the calculated period being consistent with results of previous studies which used data from the summer and fall of 1972. SUPERCRITICAL WITHDRAWAL FROM TWO-LAYERED FLUID SYSTEMS, PART 1: TWO-DIMENSIONAL SKIMMER WALL,
Cornell Univ., Ithaca, NY. Dept. of Environmental Engineering.
G. H. Jirka.
Journal of Hydraulic Research, Vol 17, No 1, p 43-51, 1979. 4 fig, 11 ref.

Descriptors: *Stratified flow, *Model studies, *Intakes, *Flow control, Mathematical models, Analytical techniques, Theoretical analysis, Analysis, Weirs, Laboratory tests, Supercritical flow, Hydraulic structures, Intakes structures, Reservoirs, *Skimmer wall, *Selective withdrawal, Two-dimensional flow, Two-layer flow.

An analysis of the selective withdrawal features of a two-dimensional skimmer wall was developed based on the concept of a double critical flow section in the two-layered stratified fluid system. The theory predicts the withdrawal ratio as a function of two governing parameters, a densimetric Froude number and a layer depth ratio. The skimmer wall design condition of incipient withdrawal as derived by Harleman and Elder (1965) is included as a special case. Good qualitative agreement with available experimental data is found. An 'effectiveness' diagram displaying the fully effective, partially effective and non-effective regimes of skimmer wall operation was developed. (See also W79-06767) (Humphreys-ISWS)

SUPERCRITICAL WITHDRAWAL FROM TWO-LAYERED FLUID SYSTEMS, PART 2: THREE-DIMENSIONAL FLOW INTO ROUND INTAKE,
Cornell Univ., Ithaca, NY. Dept. of Environmental Engineering.
G. H. Jirka, and D. S. Katavola.
Journal of Hydraulic Research, Vol 17, No 1, p 53-62, 1979. 8 fig, 1 tab, 5 ref.

Descriptors: *Stratified flow, *Intakes, *Flow control, *Model studies, Hydraulic structures, Intakes structures, Laboratory tests, Hydraulic models, Analytical techniques, Analysis, Dimensional analysis, Supercritical flow, Conduits, Reservoirs, *Round intake, *Selective withdrawal, Three-dimensional flow, Two-layer flow.

An experimental study was made of the selective withdrawal characteristics of a round horizontal axis pipe intake located in a vertical wall. The ambient fluid system has a two-layer stratification with a diffuse interface. The results for incipient withdrawal indicate considerably lower critical Froude numbers than that obtained by earlier studies by Craya (1949) and Gariel (1949). Geometry effects due to the intake diameter and the pycnocline thickness appear to cause this discrepancy. The supercritical withdrawal ratio from both fluid layers exhibits a unique dependence on the densimetric Froude number normalized by its critical

alue. The withdrawal characteristics in the super-ritical range, with simultaneous withdrawal from oth layers, can be represented by a unique empiri-al curve independent of geometric effects. (See lso W79-06766) (Humphreys-ISWS)

Data were collected and summarized on the hydrology and hydrogeology of 949 lakes, 10 acres or larger, in the Minneapolis-St. Paul metropolitan area, Minnesota. Eight tables totaling over 100 pages present data on location, depth, area, lake level, ecological and game-management classification, inflowing and outflowing streams, soils, bedrock type, water added to or taken from lake, and reported lake-related problems. SYSTEM 2000, a generalized computer data-base management system, was used to organize the data and prepare the tables. SYSTEM 2000 provides powerful capabilities for future retrieval and analysis of the data. The data base is available to potential users so that questions not implicitly anticipated in the preparation of the published tables can be answered readily, and the user can retrieve data in tabular or other forms to meet his particular needs. DISSOLVED-SOLIDS BUDGET OF LAKE OKEECHOBEE, FLORIDA, OCTOBER 1964 TO SEPTEMBER 1974,
Geological Survey, Tallahassee, FL. Water Resources Div.
D. V. Maddy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-293 028, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 77-97, 1978. 36 p, 3 fig, 14 tab, 22 ref.

Descriptors: *Hydrologic budget, *Dissolved solids, *Lakes, *Inflow, *Discharge(Water), Rainfall, Evaporation, Regression analysis, Water quality, Florida, *Lake Okeechobee.

Lake Okeechobee is a major surface-water storage facility for south Florida. A dissolved-solids budget for Lake Okeechobee was computed for Oct. 1964 to Sept. 1974, a 10-year budget period. Calculations were based on records of daily discharge, daily specific conductance measurements, and regression equations relating dissolved-solids concentrations and specific conductance. The lake received more than 13 million acre-feet of rainfall during the budget period and lost more than 18 million acre-feet of water to evaporation. Lake Okeechobee received more than 20 million acre-feet of inflow and released almost 16 million acre-feet to distributaries. A water budget of 34.48 million acre-feet for the 10-year budget period was computed. Rainfall produced an input of 460,000 tons of dissolved solids to Lake Okeechobee. Inflow from tributaries and distributaries added 5.51 million tons of dissolved solids to the lake and outflow to distributaries removed 6.71 million tons. A dissolved-solids budget of 6.99 million tons for the 10-year budget period was computed. (Woodard-USGS)

PRELIMINARY WATER-QUALITY CHARACTERIZATION OF LAKES IN WASHINGTON,
Geological Survey, Tacoma, WA. Water Resources Div.
G. C. Bortleson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 100, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 77-94, 1978. 31 p, 5 tab, 25 ref. append.

Descriptors: *Washington, *Lakes, *Chemical properties, *Physical properties, *Analytical techniques, Water analysis, Chlorophyll, Evaluation, Planning, Lake restoration.

A method is described for comparing and characterizing lakes in Washington on the basis of water quality. The method can aid in selecting lakes for lake-restoration efforts. To simplify comparisons, a characteristic value (CV) was developed for each of 617 lakes in Washington using principal-component analysis. Three of 14 water-quality properties measured were used in this analysis because the principal component of the three properties accounted for 63 percent of the variance in the correlation matrix. The three properties were Secchi-disc visibility and concentrations of phosphorus and organic nitrogen. The significance of the derived CV's was evaluated by regression of chlorophyll a concentration against CV. The resulting standard error of estimate of + or - 1.8 micrograms per liter of chlorophyll a indicated that the CV can be a useful index in assessing relative water-quality and trophic conditions among lakes. (Woodard-USGS)

SEASONAL SUCCESSION OF PHYTOPLANKTON IN ROOSEVELT LAKE, ARIZONA,
Arizona State Univ., Tempe. Dept. of Botany and Microbiology.
R. Cisneros, R. D. Olsen, and M. R. Sommerfeld.
Journal of the Arizona-Nevada Academy of Science, Vol. 14, No. 1, p 7-12, Feb. 1979, 2 fig, 1 tab, 26 ref.

Descriptors: *Phytoplankton, *Marine algae, *Succession, *Biological communities, *Lake morphometry, *Seasonal, Aquatic life, Diatoms, Euphotic zone, Chlorophyta, Cyanophyta, Algae, Aquatic algae, Arizona, Roosevelt Lake.

Although there have been several recent investigations on the phytoplankton of Arizona lakes, data on the abundance of phytoplankton and their seasonal dynamics in southwestern lakes remain relatively sparse. The present study was performed to determine the composition and seasonal pattern of phytoplankton succession in Roosevelt Lake, 126 km ENE of Phoenix in Gila County, Arizona, from February 1971 through August 1974. Four sampling sites were established to represent differences in reservoir morphometry, and phytoplankton were collected from the surface 2, 5, 10 and 20 M although the data presented here is primarily from the 2 M samples collected from February 1971 through February 1972. Site selections, depths and time periods were chosen to be generally representative of species richness, abundance and succession in the euphotic zone of Roosevelt Lake. Results indicated that 109 species of algae occurred annually in the plankton of this lake, the majority of which were the species Chlorophycean and Bacillariophycean. Community size was found to be relatively constant throughout the year although a noticeable succession of algal classes and species occurred in which blue green algae was summer dominant and diatoms dominated the winter flora. Algal flora was found to be primarily temperate in nature with some tropical tendencies. (Tickes-Arizona)

A GENERAL CIRCULATION MODEL FOR LAKES,
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
J. C. K. Huang.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 834, Price codes: A03 in paper copy, A01 in microfiche. Report No. NOAA Technical Memorandum ERL GLERL-16, August 1977. 46 p, 12 fig, 1 tab, 30 ref, 1 append.

Descriptors: *Lakes, *Model studies, *Circulation, *Equations, *Water circulation, *Lake morphology, Lake morphometry, Bathymetry, Surface waters, Wind pressure, Meteorology, Currents(Water), Density currents, Movement, Lake breezes, Lake Ontario, Research and development, Thermocline, Boundary layers, Air-water interfaces, Water temperature.

The lake circulation model developed is based on primitive equations relative to a geographic coordinate system on the surface of the earth, and takes all major physical processes into account, including the nonlinear effects and the horizontal effects, with a rigid lip approximation for computational efficiency. It simulates the organized water motion and temperature structure throughout the annual cycle to enable the physical nature of the lake to be understood in response to atmospheric forcing. Fresh water density is approximated as a quadratic function of temperature. Imposed meteorological conditions drive lake circulation. Test runs were made using the geometry and bathymetry of Lake Ontario on a 5-km grid with four vertical layers. Two cases where surface winds and heat are similar to the average conditions of July and November show that the total lake response is dominantly barotropic and gradually become baroclinic. Wind pattern, surface current, and flow pattern data are discussed. That the simulated current pattern did not totally agree with the International Field Year for the Great Lakes data may be due to the coarse grid separations in the horizontal and vertical directions without proper resolution of the boundary layers and the thermocline. It is expected that the errors involved with stresses and heating will be reduced when time-dependent, seasonal variation runs are made. (Davison-IPA)

PROCEEDINGS: LAKE MANAGEMENT CONFERENCE, JUNE 9, 1977, UNIVERSITY OF CONNECTICUT, STORRS.
Connecticut Univ., Storrs. Inst. of Water Resources.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 093, Price codes: A07 in paper copy, A01 in microfiche. Report No. 30, March 1979. 130 p, 28 fig, 19 tab, 48 ref. OWRT A-999-CONN(18). OWRT 14-34-0001-9007.

Descriptors: *Lakes, *Eutrophication, Phosphorus, Land use, Groundwater, Lake management, Connecticut lakes, Nutrient budgets.

Eight technical papers on various aspects of lake management were presented at the Lake Management Conference held at the University of Connecticut in 1977. The results of research on the various suspected causes of lake eutrophication, the relationship of land use to lake water quality, the ongoing lake management strategies and the plans suggested for future approaches were explained. The effectiveness of various eutrophication control methods were discussed and the costs to be expected for the use of these methods were given. Emphasis was placed on the management of Connecticut lakes, although studies on lakes throughout the state and the nation were also mentioned. Two major benefits of the conference were the presenting of new technical information on lake management strategies by the speakers and the opportunity of participants to meet people who have some of the information and background in managing lakes. ESTIMATION OF WATER SURFACE ELEVATION PROBABILITIES AND ASSOCIATED DAMAGES FOR THE GREAT SALT LAKE,
Utah Water Research Lab., Logan.
L. D. James, D. S. Bowles, W. R. James, and R. V. Canfield.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 056, Price codes: A09 in paper copy, A01 in microfiche. Water Resources Planning Series UWRL/P-79/03, March 1979. 182 p, 6 append, 25 fig, 63 tab. OWRT B-153-UTAH(2). 14-34-0001-8122.

Descriptors: Flood estimate, Frequency analysis, *Lake stages, Stochastic models, Synthetic hydrology, Lakes, *Water levels, Great Salt Lake, Terminal lakes.

Rising water surface elevations in perennial terminal lakes threaten major damages to shoreline industrial plants, transportation routes, and wetlands. Falling elevations increase pumping costs for industries extracting minerals from the lake water and reduce the quality of shoreline recreation. The managers of these properties need information on future lake level probabilities for planning, and public agencies need information on both probabilities and damages to determine whether lake level control is justified. Methods of operational hydrology were used to simulate lake level and shoreline damage sequences for the Great Salt Lake. Both ARMA (1,0) and ARMA (1,1) models were tried in generating multivariate sequences of precipitation, evaporation, and three river flows for 1937-1977. The multivariate Markov model was the only one able to preserve historical sequences, but recommendations for improved parameter solution techniques for the ARMA (1,1) model are made to help future users take better advantage of its theoretically greater ability to preserve hydrologic persistence. The model developed with the capability of estimating low future lake level probabilities would be affected by upstream water development and by pumping water from the lake during high stages into the western desert. Data on damages to 21 cost centers were collected, and a damage simulation model was developed to use them to estimate average annual damages under current conditions and benefits from lake level control efforts. Average annual damages to the mineral industry, railroads, highways, wetlands, and other properties were estimated to be currently $1,550,000.

ON PRESSURE-WORK, VISCOUS DISSIPATION AND THE ENERGY BALANCE RELATION FOR GEOTHERMAL RESERVOIRS,
Systems, Science and Software, La Jolla, CA.
S. K. Garg, and J. W. Pritchett.
Advances in Water Resources, Vol. 1, No. 1, p 41-47, September 1977. 2 tab, 11 ref.

Descriptors: *Geothermal studies, *Reservoirs, *Pressure-work, *Viscous dissipation, *Energy, *Balance laws, Flow, Effects, Temperature, Computers, Simulation analysis, Equations, Numerical solutions, Mass, Momentum.

This article examines the conditions under which the pressure-work and viscous dissipation terms should be retained in the energy balance relation for single (liquid water or vapor) and two-phase (liquid water and vapor) fluid flow through porous media. It is shown that if one wishes to retain the pressure-work term, then one must also keep the viscous dissipation term in the energy balance. Consideration of steady non-isothermal radial flow demonstrates that both pressure-work and viscous dissipation are liable to have negligibly small effects in single phase liquid water and in two-phase liquid-vapor systems. This conclusion is, however, not generally valid for pure vapor systems; in this case, pressure-work and viscous dissipation can produce significant variations in the computed reservoir response. OPERATIONAL EFFECTS OF IRRIGATION AND PUMPED STORAGE ON THE ECOLOGY OF BANKS LAKE, WASHINGTON,
Washington Univ., Seattle. Fisheries Research Inst.
Q. J. Stober, R. W. Tyler, J. A. Knutzen, D. Gaudet, and C. E. Petrosky.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-293 790, Price codes: A08 in paper copy, A01 in microfiche. Final Report No. REC-ERC-77-5, December 1977. 165 p, 100 fig, 27 tab, 71 ref, 1 append. 14-06-100-7794.

Descriptors: *Ecology, *Fish, *Fish populations, *Fish management, *Pumped storage, *Limnology, *Powerplants, Drawdown, Environmental effects, Lake morphology, Nutrients, Reservoirs, Fish reproduction, Sport fish, Phytoplankton, Zooplankton, Columbia Basin Project, Banks Lake, Franklin D. Roosevelt Lake(Washington).

The physical, chemical and biological changes in Banks Lake, Washington, resulting from pumping/generating operations are discussed. Banks Lake functions as the reregulating reservoir for the Columbia Basin irrigation project. Results of the following studies are reported: limnology of the lake, fish populations monitoring, kokanee fry study, 1975-76 sport fishery, and fish entrainment through the irrigation and feeder canals. The north pool of this two pool system is directly influenced by the pumped input of water from FDR Reservoir. This pumped inflow maintained warmer temperatures in the winter and cooler temperatures in the summer in the north pool relative to the south pool. The north pool showed thorough mixing of the water column, greater concentrations of the plant nutrients, nitrates and phosphates, and greater phytoplankton production than found in the south pool. Zooplankton developed in the south pool. Of the 22 species of fish identified in the lake 90% were yellow perch, lake whitefish, and kokanee. In general the three major species avoided the north pool. Drawdown of the lake in 1973 and 1974 resulting from powerplant construction at Grand Coulee Dam reduced the reproduction of the yellow perch and kokanee. Fish loss due to entrainment occurred mainly through the irrigation canal; fish entrainment through the feeder canal was relatively minor. It is concluded that nutrient addition and mixing are beneficial, but water level fluctuations, entrainment and flushing limit production and maintenance of aquatic life. (Davison-IPA)

LEAF OSMOTIC POTENTIAL AS AN INDICATOR OF CROP WATER DEFICIT AND IRRIGATION NEED IN RAPESEED (BRASSICA NAPUS L.),
Department of Agriculture, Swift Current (Saskatchewan). Research Station.
J. M. Clarke, and G. M. Simpson.
Agricultural Water Management, Vol 1, No 4, p 351-356, December, 1978. 2 fig, 3 tab, 8 ref.

Descriptors: Moisture deficit, *Moisture content, Water requirements, Moisture stress, Moisture tension, Leaves, Tensiometers, *Osmotic pressure, Crop production.

Leaf osmotic potentials (LOP) of field-grown rapeseed (Brassica napus L.) were measured in 1975 and 1976 under rainfed conditions and at two levels of irrigation. Irrigations were scheduled on the basis of tensiometer measurements in 1975, and on the basis of LOP in 1976. The LOP of rainfed plants was lower (more negative) than that of irrigated plants. Leaf osmotic potential responded to changes in soil moisture caused by precipitation or irrigation. Tensiometers placed at 0.2 m depth in the high irrigation treatment were as responsive to soil moisture changes as LOP. Scheduling of irrigations on the basis of LOP in 1976 produced yield differences between water regimes similar to those obtained in 1975. It was concluded that leaf osmotic potential provides a satisfactory means for determining need for irrigation in B. napus. (Skogerboe-Colorado State)

SOYBEAN CROP WATER REQUIREMENTS,
Regional Center of Agricultural Research, Crida (Spain). Dept. of Cereals and Legumes.
J. Dominquez, M. Horta, and E. Robledo.
ICID Bulletin (International Commission on Irrigation and Drainage), Vol. 27, No. 2, p 30-35, July, 1978. 3 fig, 22 ref.

Descriptors: Soil-water-plant relationships, *Water requirements, *Soybeans, Moisture deficit, Moisture stress, Growth stages, Evapotranspiration, Yield equations, Crop production.

In experiments carried out in the three-year period 1974-1976, in 'Finca El Encin', CRIDA, Alcala de Henares, on soybean crops irrigated by sprinklers, Amsoy variety, a very high correlation between the RET (Real Evapotranspiration) in the flowering and pod formation period and the final grain production was found. This suggested, on the one hand, subjecting the plant to an initial deficit to adequately develop the root system and on the other, supplying quantities of about 9 mm during The said period, which should increase the production level to 4,000 kg/hectare. Penman's modified formula for daily application, following the guidelines of the Irrigation Management Service, proved to be inadequate in the sense that it provided low ETP values. A greater consideration of the aerodynamic term was suggested by the influence that the advective effect has on irrigation areas with arid climate. For practical experiments the scheme based on the utilization of the distribution curves of a water sprinkler, was satisfactory, leading to a more reliable analysis, and to a simplification of the experimental procedure. WATER BALANCE OF FLOODED RICE PADDIES,
Texas A and M Univ., College Station. Dept. of Soil and Crop Sciences.
K. W. Brown, F. T. Turner, J. C. Thomas, L. E. Deuel, and M. E. Keener.
Agricultural Water Management, Vol. 1, No. 3, p 277-291, November, 1978. 10 fig, 3 tab, 8 ref.

Descriptors: *Water balance, Submerged plants, *Flood irrigation, *Rice, Evapotranspiration, Runoff.

Rice (Oryza sativa L., var. Labelle) was grown in 300 m 2 paddies of Beaumont clay soil (Typic pelludert) and subjected to two management schemes of flooded rice culture. These schemes were continuous irrigation and intermittent irrigation. Careful measurements of irrigation, precipitation, evapotranspiration, deep percolation and runoff were made, and the total water balance for the two water management schemes was calculated. The results showed continuous irrigation to be very wasteful of water with slightly over 1 m of irrigation water applied to supply an evapotranspirational need of 0.5-0.6 m. The intermittent irrigation management was less wasteful but still could be improved upon. Suggestions were presented for techniques to help improve the water use efficiency and reduce runoff losses. GRAPEFRUIT RESPONSE TO VARIABLE SALINITY IN IRRIGATION WATER AND SOIL,
Agricultural Research Organization, Bet-Dagan (Israel). Inst. of Soils and Water.
H. Bielorai, J. Shalhevet, and Y. Levy.
Irrigation Science, Vol. 1, p 61-70, 1978, 3 fig, 4 tab, 16 ref.

Descriptors: *Grapefruit, *Saline water, *Crop response, *Irrigation water, *Soil-water-plant relationships, Water quality, Soil chemical properties, Salt tolerance, Irrigation effects, Consumptive use, Citrus fruits, Israel.

Increasing salinity in irrigation water throughout the arid-semiarid world is a matter of growing concern in regions where irrigated crops such as citrus are vital to export economies. The field experiment described in this paper was conducted in the northern Negev Desert region of Israel during 1973-1976 where a control orchard was subjected to 8 varying concentrations of sodium chloride and calcium chloride injected into the sprinkler irrigation system. Soil water content was measured before and after each irrigation at intervals .3m to a depth of 1.8m with a neutron probe. Irrigation efficiency for each irrigation was determined by the difference between pre-and post-irrigation soil water content. Results indicate that total water uptake was reduced as salt concentration in the soil increased, and yield was linearly related to the mean chloride concentration in the soil saturation extract. Salt accumulation in the soil was found to be dependent on the quantity and salt concentration of the irrigation water, rainfall, and the amount of leaching. No leaf injury was observed. It is concluded that the effect of salinity on grapefruit yield is osmotic rather than the result of a specific ion. (Tickes-Arizona)

CORN PRODUCTION AS INFLUENCED BY IRRIGATION AND SALINITY - UTAH STUDIES,
Utah State Univ., Logan. Dept. of Soil Science and Biometeorology.
R. J. Hanks, G. L. Ashcroft, V. P. Rasmussen, and G. D. Wilson.
Irrigation Science, Vol. 1, p 47-59, 1978. 9 fig, 3 tab, 8 ref. OWRT B-121-UTAH(3) and C-5189(4233)(4).

Descriptors: *Crop response, *Salty tolerance, *Corn, *Irrigation effects, *Soil-water-plant relationships, *Evapotranspiration, Consumptive use, Plant growth, Saline water, Saline soil, Water quality, Sprinkler irrigation.

Described here are the Utah results of a wider study carried out in Arizona, California, Colorado, and Utah, 1974-1975, to develop a predictive model of the several site-specific irrigation and salinity effects on corn production. Trials conducted at Utah State University's Greenville Farm on silt loam soil evaluated the influence of differing amounts and timing of saline irrigation water. Using trickle irrigation, treatments were applied uniformly at all water levels. Results indicated that corn grain and total dry matter production were linearly related to evapotranspiration, regardless of the irrigation or salinity regimes. Soil pre-salinization decreased yields in proportion to the salinity imposed. The decrease was associated with reductions in evapotranspiration caused by reduced soil water depletion, as compared with the non-salinized treatments. (Tickes-Arizona)

2J. Erosion and Sedimentation

SEDIMENT SIZES ERODED FROM ROW-CROP SIDESLOPES,
Science and Education Administration, Oxford, MS. Sedimentation Lab.
L. D. Meyer, W. C. Harmon, and L. L. McDowell.
Paper No 78-2518, Presented at the 1978 Winter Meeting of the American Society of Agricultural Engineers, December 18-20, 1978 Chicago, Illinois. 9 p. 7 fig, 4 tab, 13 ref. ASAE, St. Joseph, Michigan.

Descriptors: Sediments, *Sediment distribution, Simulated rainfall, *Soil erosion, Rainfall intensity, Canopy.

Row sideslopes of ten soils were studied under simulated rainstorms to determine the size distributions of their eroded (undispersed) sediment. The eroded sediment sizes for different soils differed considerably. These distributions were compared to the size distributions of the dispersed sediment and original surface soil. The undispersed sediment was coarser than the dispersed soil or sediment, much coarser for many soils. For each soil, the sediment size distribution changed relatively little with major changes in rain intensity, continued erosion, and crop canopy. (Skogerboe-Colorado State)

EVALUATION OF GRASS CHARACTERISTICS RELATED TO SEDIMENT FILTRATION,
Kentucky Univ., Lexington. Dept. of Agricultural Engineering.
J. C. Hayes, B. J. Barfield, and R. I. Barnhisel.
Paper No. 78-2513, Presented at the 1978 Winter Meeting of the American Society of Agricultural Engineers, December 18-20, 1978, Chicago, Illinois. 21 p, 7 fig, 2 tab, 10 ref. ASAE, St. Joseph, Michigan.

Descriptors: *Sediment transport, Sediment control, Filtration, *Grasses, Vegetation effects, Sediment yield, Regression analysis, Roughness coefficient, Watershed management.

Vegetal filtration was proposed as a means of reducing sediment from disturbed areas. Recent studies using simulated media have led to relationships which define deposition within a grass filter. Several characteristic dimensions were required to define the effects of vegetation on flow and sediment transport. Quantification of these dimensions, sensitivity of the relations to errors in measurement, and further verification data were included. (Skogerboe-Colorado State)

FARM LEVEL ECONOMIC EVALUATION OF EROSION CONTROL,
Iowa State Univ., Ames.
J. M. McGrann.
Paper No. 78-2515, Presented at the 1978 Winter Meeting of the American Society of Agricultural Engineers, December 18-20, 1978, Chicago, Illinois. 13 p. 2 fig, 3 tab, 15 ref. ASAE, St. Joseph, Michigan.

Descriptors: *Erosion control, Soil erosion, Cost comparisons, Soil management, Economic impact, *Contour farming.

Farm level economic evaluation of erosion control alternatives in three major soil associations in Iowa indicated that: (1) residue tillage and contouring is the most cost effective alternative to reduce soil erosion, (2) the economic impact of reducing soil loss is less on mixed crop and livestock farms than specialized crop farms, and (3) although the economic impact of erosion control differs between soil areas, reduction of soil loss below the 5 ton level can be accomplished through conservation tillage in large areas of Iowa with little reduction in farm income without public participation in farm level costs. EROSION INVENTORY-SHEET AND RILL EROSION,
Soil Conservation Service, Washington, DC.
R. I. Dideriksen, and A. R. Hidlebaugh.
Paper No. 78-2514, Presented at the 1978 Winter Meeting of the American Society of Agricultural Engineers, December 18-20, 1978, Chicago, Illinois. 33 p, 3 fig, 14 tab, 13 ref. ASAE, St. Joseph, Michigan.

Descriptors: *Soil erosion, *Rill erosion, Sheet erosion, Wind erosion, Erosion control, Data collections, Conservation.

Erosion by wind and water from farmland remains a serious problem in the United States. This inventory takes a new look at the problem and provides current information on natural and related resources on nonfederal land for all states except Alaska. Nearly one quarter million randomly selected sample sites were observed in the field and farm owners and operators were interviewed. The data gathered in 1977 were used in the Universal Soil Loss and Wind Erosion models to estimate the rate and amount of sheet, rill, and wind erosion for different soils, land uses, and management systems. INVESTIGATION OF THE PROBABILISTIC REGULARITIES OF SALTATION OF SOLID PARTICLES IN A TURBULENT FLOW,
Akademiya Nauk SSSR, Moscow. Inst. Vodnykh Problem.
N. N. Grishin.
Water Resources, Vol. 4, No. 6, p 941-947, November-December 1977. 4 fig, 20 ref. Translated from Vodnye Resursy, No. 6, p 174-181, November-December 1977.

Descriptors: *Saltation, *Sediment transport, *Suspended solids, *Sediments, *Model studies, Mathematical models, Erosion, Turbulent flow, Velocity, Turbidity, Movement, Sedimentology.

The movement of solid particles in turbulent air or water flows has, as a rule, a leap-like character. The existing theories of the bounding movement of sediments are usually based on the assumption of the absence of interaction between particles, i.e., the content of sediments in a unit volume of the medium transporting them is assumed to be sufficiently small. However, in many problems the need arises to examine the mass movement of sediments. The particles saltating near the bottom form turbidity there; the magnitude of the near-bottom turbidity is usually taken as a boundary condition of the diffusion equation, by means of which the distribution of suspended sediments in open flows for not very large concentrations and sufficiently small sizes of the particles is generally described. In connection with this, it is of interest to study the problem of the permissible concentrations of saltating particles for which the regularities obtained for the case of movement of single particles are still valid. Examining the mass movement of particles, we must take into account both the collision of particles and their effect on kinematics of the flow. In this article, the kinematics of the particles themselves, the average velocity relative to their movement, were examined. By means of this examination the probability of collision of the particles was estimated. Therefore, the values of the concentrations of saltating sediments corresponding to the upper limit of applicability of the aforementioned concept of noninteraction between particles can be obtained. FLOW PAST BODIES IN A TURBULENT FLOW NEAR A SOLID SURFACE,
Akademiya Nauk SSSR, Moscow. Inst. Vodnykh Problem.
K. I. Rossinskii, and K. M. Arbulieva.

Water Resources, Vol. 4, No. 6, p 926-935, November-December 1977. 9 fig, 10 ref. Translated from Vodnye Resursy, No. 6, p 156-167, November-December 1977.

Descriptors: *Turbulent flow, *Boundary layers, *Bottom sediments, Suspended solids, Model studies, Mathematical models, Flow, Hydraulics, Reynolds number, Boundaries(Surfaces), Fluid mechanics, Sedimentation, Erosion, Sedimentology, Flow past bodies.

If a turbulent flow is underlain by soil consisting of individual particles not cohering to one another, then at sufficient current velocities of the water individual soil particles are detached from the bottom by the flow and either perform leaps near the bottom or are entrained into the flow and move in a suspended state. Detachment of the particles occurs as a result of the hydrodynamic action of the flow. The nature of this action is still the subject of debate. During interaction of a moving fluid and a solid body located in it which has a symmetrical form relative to the direction of the average current (sphere, cylinder with an axis normal to the current, etc.) in an unconfined flow, as is known, does not occur, since the pressures developing on the upper and lower surfaces of such a body are the same on both sides and cause only tensile stresses within the body. The effect of a wall on the force developing during flow past a body has been studied by a number of investigators and at present interesting data have been accumulated which permit judging the character of the phenomenon. The results of such investigations were presented, and one of the possible explanations of the nature of the lift detaching solid particles from the bed of a turbulent flow was given. (Sims-ISWS)

INPUT-OUTPUT MODEL FOR RUNOFF-SEDIMENT YIELD PROCESSES,
Govind Ballabh Pant Univ. of Agriculture and Technology, Pantnagar (India). Dept. of Agricultural Engineering.
T. C. Sharma, W. G. S. Hines, and W. T. Dickinson.
Journal of Hydrology, Vol. 40, No. 3/4, p 299-322, February 1979. 6 fig, 12 tab, 13 ref.

Descriptors: *Sediment yield, *Model studies, *Runoff, Watersheds(Basins), Statistical methods, Statistical models, Hydrology, Equations, Mathematical models, Stochastic processes, Analysis, Monthly, *Watershed fluvial system, Parsimonious models, Input-output models.

Runoff (log-transformed) and sediment yield (log-transformed) sequences on a monthly or daily basis can be regarded as input and output for the watershed fluvial system. These sequences are nonstationary, in general, in different hydrological environments. Frequency and time domain analyses have shown that a parsimonious model can be built directly in terms of these nonstationary input-output sequences on a monthly and daily basis. A first-order dynamic model was found adequate to model the monthly runoff-sediment yield process; a second-order model adequately modeled the daily runoff-sediment yield process. The noise component in both cases possessed the characteristics of a white-noise sequence. (Lee-ISWS)

ESTIMATING SEDIMENT TRANSPORT IN A BRAIDED GRAVEL CHANNEL--THE KAWERONG RIVER, BOUGAINVILLE, PAPUA NEW GUINEA,
Papua and New Guinea Univ., Port Moresby (New Guinea).
G. Pickup, and R. J. Higgins.
Journal of Hydrology, Vol. 40, No. 3/4, p 283-297, February 1979. 8 fig, 1 tab, 17 ref.

Descriptors: *Sediment transport, *Channels, *Braiding, Monte Carlo method, Sedimentation, Sediments, Streams, Hydraulics, Equations, Rivers, *White River, *Papua New Guinea, *Bougainville Island(Papua New Guinea), *Braided channel, *Kawerong River(Papua New Guinea), Braided streams.

It is difficult to estimate sediment transport in braided rivers because of the complex hydraulics of rapidly changing multi-channel systems. This paper described an algorithm for generating sets of braided-river hydraulic parameters for use with sediment transport equations. The algorithm used random number-based simulation techniques and empirically determined probability distributions of individual hydraulic variables from the White River (U.S.A.) and the Kawerong River. A test of the suitability of the algorithm for the estimation of sediment transport was carried out over a period of two years using the Meyer-Peter and Muller equation on 8 reaches of the Kawerong River in which sediment transport is known. The test produced a mean absolute error of 16.3%, suggesting that the algorithm may have some potential in braided-river modelling. (Lee-ISWS)

THE INTRUSION OF FINE SEDIMENTS INTO A STABLE GRAVEL BED,
Oregon State Univ., Corvallis. School of Forestry.
R. L. Beschta, and W. L. Jackson.
Journal of the Fisheries Research Board of Canada, Vol. 36, No. 2, p 204-210, February 1979. 5 fig, 1 tab, 18 ref.

Descriptors: *Streambeds, *Laboratory tests, *Hydraulic models, *Sedimentation, Sediment transport, River beds, Gravels, Silting, Deposition(Sediments), Model studies, Sands, Bed load, Particle size, Hydraulics, Flow, Data collections, Methodology, Flow characteristics, Movement, Analysis, Riffles, Substrates.

A rectangular flume was used to study variables affecting the intrusion of fine sands into a stable gravel streambed. The amount of intrusion by sand (median particle diameter 0.5 mm) was determined under varied conditions of discharge, depth, velocity, flume slope, and rates of sediment transport. During all experimental tests, sand particles were trapped in voids within the upper 10 cm of an initially clean gravel bed (median particle diameter 15 mm), forming a barrier to further intrusion. An analysis of flow variables showed that flow conditions, as indexed by Froude number, significantly (90% confidence level) affected intrusion amounts, possibly by influencing the rate and depth of formation of the sand seal. Intrusion amounts, expressed as a percent of total volume, varied from 2 to 8%. Two replications used a finer grade sand (median particle diameter 0.2 mm) that intruded more and, in one case, completely filled the gravel pore space (25% by volume), further indicating that particle size, and not hydraulic variables, may have a more important influence on the total amount of intrusion. KAOLINITE RESUSPENSION PROPERTIES,
Florida Univ., Gainesville. Dept. of Coastal and Oceanographic Engineering.
A. J. Mehta, and E. Partheniades.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY4, Technical Note, p 411-416, April 1979. 5 fig, 5 ref. NSF GK-31259.

Descriptors: *Erosion, *Cohesive soils, *Deposition(Sediments), *Laboratory tests, Movement, Suspended solids, Sediment transport, Sedimentation rates, Suspension, Tractive forces, Kaolinite, Incipient motion, Resuspension.

The phenomena of erosion and deposition of fine, flocculated, cohesive sediments were studied during the past several years. The first investigations, which were limited primarily to The erosion phase, were conducted in an open flume with recirculating water at ocean salinity with natural silty-clay sediments. Basic investigations of the depositional aspects of flocculated cohesive sediments were carried out more recently in an annular channel 60 inches in mean diameter, 8 inches wide, and 18 inches deep containing the water-sediment suspension, and an annular ring positioned within the channel and in contact with the water surface. A limited investigation of the resuspension properties of flow deposited sediment was carried out with a commercially available kaolinite in this apparatus. Limited experiments on the initiation of motion of sand grains in the annular channel-ring system showed a reasonable agreement with Shields' curve for incipient motion. The resuspension rates of stratified beds continuously decrease, and may even become zero, as the depth of erosion increases. On the other hand, the erosion rates of uniform beds remain constant. This is in agreement with earlier observations on natural bay deposits. The nondimensional plot of the erosion rate against the bed shear stress for uniform beds agrees with earlier results based on soils with drastically different mineralogical composition. EROSION DEPOSITS IN TILE-DRAINS,
Macaulay Inst. for Soil Research, Aberdeen (Scotland).
E. Paterson, and B. D. Mitchell.
Agricultural Water Management, Vol. 1, No. 4, p 311-317, December, 1978. 2 fig, 1 tab, 6 ref.

Descriptors: *Tile drains, Tile drainage, Silting, Deposition(Sediments), *Soil erosion, Sedimentation.

The mechanism of silting up of tile field drains in two heavy textured surface water gley soils was examined by comparing the physical and mineralogical characteristics of deposits in drains with those of the clay soil directly above. The deposits consisted of clay, silt and sand and are distinctly laminated. They appeared to be the result of internal erosion of the soil. The processes operative seemed to have been: (a) inflow of soil through the drain joints; (b) sedimentation in the drain; (c) elution of very fine material. The possibility that this silting-up phenomenon is not uncommon in the tile field drains of surface water gley soils of Scotland was recognized. (Skogerboe-Colorado State)

INVESTIGATION OF THE SPEED OF BED LOAD MOVEMENT,
V. V. Romanovskiy.
Soviet Hydrology: Selected Papers, Vol. 16, No. 2, p 108-112, 1977. 2 fig, 10 ref, 1 append. Translated from Transactions of the State Hydrologic Institute (Trudy GGI), No. 242, p 71-81, 1977.

Descriptors: *Bed load, *Laboratory tests, *Theoretical analysis, *Sediment transport, Saltation, Foreign research, Sediments, Movement, Open channels, Analytical techniques, Methodology, Velocity, Traction, Roughness(Hydraulic), Hydraulics, *USSR.

To establish the relation between the speed of traction particles and their shape and flow velocity and to determine the lag of particles moving at the bottom behind their surrounding water mass, a theoretical study of the equation of motion of particles along the bottom and a laboratory investigation were described. The speed of bed load particles was determined experimentally in a small flume (7 m long and 0.2 m wide) and also in a large flume (0.5 m wide and 30 m long). The experiments were made with particles from 1.3 to 5.0 cm in diameter. The roughness of the flume bottom was uniform with projections of 0.02 cm, 0.15 cm, and 1 cm. The grains of the underlying surface were glued to the bottom of the flume. The results of the measurements were used to construct curves of the relation between the speed of particle traction and flow velocity. It was found that there is a

fairly close linear relationship between them, which is independent of the grain size of the underlying surface of the bottom. The tangent of the angle of slope of this straight line varies from 1.1 for spherical particles to 1.4 for flat particles. Analysis of the experimental data showed the following: (1) The speed of particles along the bottom (in the investigated range of relative coarseness 1.6 to 250) depends on the velocity of the streamline flow and is independent of the size of the projections (dimensions) of bottom roughness. (2) The lag of a particle behind the surrounding flow is a function of its initial traction speed and of its shape. (3) The lag of a particle behind its surrounding flow decreases with increasing flow velocity. (Humphreys-ISWS)

PRESENT AND POTENTIAL SEDIMENT YIELDS IN THE YAMPA RIVER BASIN, COLORADO AND WYOMING,
Geological Survey, Lakewood, CO. Water Resources Div.
E. D. Andrews.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-292 677, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 78-105, December 1978. 33 p, 10 fig, 4 tab, 32 ref.

Descriptors: *Sediment transport, *Sediment yield, *Sediment load, *Streamflow, *Flow duration, Hydrographs, Curves, Land use, Coal mines, Topography, Geology, River basins, Planning, Sediment control, *Yampa River basin(Colo-Wyo).

Average annual suspended- and total-sediment loads in streamflow were determined by the flow-duration sediment-transport-curve method at 18 sites in the Yampa River basin, Colorado and Wyoming. These computations indicate that about 2.0 million tons of sediment are carried by the Yampa River at Deerlodge Park during an average year. Significant areal differences in the sediment yield from various parts of the basin also were determined. The lower Little Snake River subbasin contributes about 60 percent of the total basin sediment yield, although it represents less than 35 percent of the area and supplies less than 3 percent of the streamflow. In contrast, the upland (eastern) one-third of the basin contributes only about 14 percent of the sediment yield but 76 percent of the streamflow. Projected economic development of the basin, especially surface mining of coal, will impact the physical environment. Depending upon the amount and location of land disturbed, an estimated 10,000 to 30,000 tons per year of additional sediment will be contributed to the mainstem Yampa River. (Woodard-USGS)

MAN, RUNOFF AND THE EROSION OF THE COASTAL SLOPES OF ASHKELON, ISRAEL,
Tel Aviv Univ. (Israel). Dept. of Geography.
A. L. Marcus.
Geojournal, Vol. 2, No. 6, p 569-573, 1978. 10 fig, 6 ref.

Descriptors: *Coasts, *Shore protection, *Accelerated erosion, *Beaches, *Runoff, *Grazing, Coastal plains, Beach erosion, Coastal engineering, Slopes, Wind erosion, Erosion control, Hydrogeology, Waves(Water), Overland flow, Pastures, Social impact, Recreation wastes, Recreation demand, Urbanization, Israel.

Because of intensified recreational and bedouin grazing use of coastal areas, exemplified in this paper by a study of the Ashkelon area south of Tel-Aviv, beach erosion has become a serious problem for the Israelis. Increasing urbanization has introduced factors that contribute to slope runoff in sufficient volume to initiate slope erosion. Effects of such enlarged runoff volume include erosion of backslope areas and deposition of large alluvial fans on the beach footslope. Underlying sandstone cliffs are exposed and gullies deepened. Establishment of parking lots, storm sewer outlets, and stairways to beach areas have additional impact on the process, so that what first appears to be practical and normal recreational uses, instead create a series of unexpected and detrimental effects on this sensitive coastal environment. The effect of intensified bedouin grazing practices on dunes inland and along coastal cliffs, while less obvious and immediate, is nevertheless potentially detrimental also, as the vegetative cover is foraged and the sandy surface exposed to wind and water erosion. These two man-environment interactions have created a destabilization-denudation process of the entire hill chain in the area under study. (Tickes-Arizona)

2K. Chemical Processes

CHLORIDE AS A FACTOR IN MOBILITIES OF NI(II), CU(II), AND CD(II) IN SOIL,
California Univ., Berkeley. Dept. of Soils and Plant Nutrition.
H. E. Doner.
Soil Science Society of America Journal, Vol 42, No 6, p 882-885, November-December, 1978. 5 fig, 3 tab, 15 ref.

Descriptors: *Trace elements, Metals, *Chlorides, Adsorption, Ion transport, Leachate, Chemical analysis, *Soil analysis, Laboratory tests.

The mobility of chloro-complexes of Ni(II), Cu(II), and Cd(II) through soil was studied. Soil columns were leached with 0.1, 0.2, 0.3, or 0.5M NaCl or CaClO4 solutions, each containing 10 microgram/ml Ni(II), Cu(II), or Cd(II). Sodium perchlorate solutions were used as a comparison with CaCl at the same ionic strength since perchlorate is not considered to form complexes with the metals. Leachates from columns and soils were collected and analyzed. Mobility of all metals tested in chloride solutions was from 1.1 to 4 times greater than that in ClO4(-) solution. Chloride increased the mobility of Cd(II) the most which corresponds to its having the largest stability constants. Copper (II) was slowest to appear in the leachate and was strongest asdorbed as evidenced by analysis of soil by digestion with either 4N HNO3 or acidified NH2OH-HCl. These results showed that Cl(-) has a marked effect on the mobility of Cd(II) and, to a lesser extent, Ni(II) and Cu(II). (Skogerboe-Colorado State)

LONG-TERM DENITRIFICATION STUDIES IN SOILS FERTILIZED WITH (15NH4)2SO4,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
D. D. Focht, and L. H. Stolzy.
Soil Science Society of America Journal, Vol 42, No 6, p 894-898, November-December, 1978. 6 fig, 1 tab, 31 ref.

Descriptors: *Denitrification, Nitrogen, Nitrates, *Nitrogen cycle, Soil gases, Lysimeters, Isotope studies, Fertilization.

A 2-year study was conducted in lysimeters containing four different soils with successive summer and winter crops of corn and barley, respectively. The crops were fertilized with (15NH4)2SO4 at application rates equivalent to 134, 108, 415, and 440 Kg N/ha for the respective summer 1973, winter 1974, summer 1974, and winter 1975 crops. The frequency of 15N dinitrogen samples was higher in the summer and higher at the lower fertilizer rates, while the reverse was true for NO3(-) concentrations in leach water and N2O concentrations in the soil profile. Emissions of N2O from soil, even where the higher concentrations were observed, were low in terms of N losses with the greatest mass emission at any time amounting to 6.5 g/ha over a 1-day period. Nitrogen gas emissions over a 1-week period in one instance were estimated at 5.2 kg N/ha; it was observed that this amount could be generated from low (1 ppm or less) concentrations of N2O. IONIC STABILITY OF PRECIPITATION SAMPLES,
Illinois State Water Survey, Urbana. Atmospheric Sciences Section.
M. E. Peden, and L. M. Skowron.
Atmospheric Environment, Vol. 12, No. 12, p 2343-2349, 1978. 6 fig, 10 ref. EY-76-S-02-1199.

Descriptors: *Chemistry of precipitation, *Sampling, *Chemical analysis, *Ions, Precipitation(Atmospheric), Rainfall, Snowfall, Chemicals, Filtration, Data collections, Equipment, Dusts, Air pollution, Fallout, Chemistry, Meteorology, Ionic stability, Precipitation sampling.

Event and weekly precipitation sampled with 3 types of collectors was stored under 5 different conditions and analyzed throughout a 6-week time period to monitor changes in ionic composition. Ca(++), Mg(++), Na(++), K(+), H(+), NH4(+), SO4(--), NO3(-), and Cl(-) were the constituents under observation. Dramatic variations in the concentrations of some species are attributable to the sample particulate loading. Although cooling retarded changes in ionic composition, immediate filtering after wet-only collection was the most effective means of retaining sample integrity and preventing adsorption-desorption reactions. COMBINED MEASUREMENT OF OXYGEN AND SULFIDE IN WATER SAMPLES,
Aarhus Univ. (Denmark). Inst. of Ecology and Genetics.
K. Ingvorsen, and B. B. Jorgensen.
Limnology and Oceanography, Vol. 24, No. 2, p 390-393, March 1979. 3 fig, 17 ref.

Descriptors: *Chemical analysis, *Oxygen, *Sulfides, Water chemistry, Laboratory tests, Sampling, On-site data collections, On-site investigations, Hydrogen sulfide, Dissolved oxygen, Water quality, Chemistry.

A method was described for chemical determination of oxygen and sulfide in the same water sample. Sulfide is first separated by precipitation with zinc hydroxide, oxygen then determined by the Winkler technique in the clear supernatant. The mutual interference between the oxygen and the sulfide determinations is less than 1-2%. The method has proven useful for field applications: as an example, the diurnal variation in oxygen and sulfide of a shallow lagoon was presented. (Sims-ISWS)

A KINETIC STUDY OF THE CAC03 PRECIPITATION REACTION,
Arkansas Univ., Fayetteville. Dept. of Agronomy.
J. T. Gilmour, K. S. Shirk, J. A. Ferguson, and C. L. Griffis.
Agricultural Water Management, Vol. 1, No. 3, p 253-262, November, 1978. 2 fig, 4 tab, 10 ref.

Descriptors: *Chemical precipitation, Chemical reactions, Soil chemistry, *Calcium carbonate, Magnesium carbonate, Mathematical models, Rice.

In order to develop water management practices which would minimize localized precipitation of Ca and Mg carbonates on Arkansas' rice fields, a description of the precipitation reaction was needed. Waters studied were prepared solutions which contained varying amounts of Ca(HC03)2 and/or MgC12, and subterranean water samples collected in the field. These waters were monitored for Ca and Mg loss due to carbonate precipi-

tation under unseeded spontaneous conditions. The rate of Ca loss from solution was adequately described by first order kinetics where Ca was the rate determining ion. An empirical equation was developed which showed the rate constant could be calculated from temperature and solution composition data. An evaluation of the rates of Ca and Mg loss from solution for the experimental periods studied showed that Mg losses were small when compared to Ca losses. (Skogerboe-Colorado State)

A SOIL-WATER-NITROGEN MODEL FOR IRRIGATED CORN ON SANDY SOILS,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
D. G. Watts, and R. J. Hanks.
Soil Science Society of America Journal, Vol. 42, No. 3, p 492-499, May-June, 1978. 8 fig, 25 ref, 1 append. OWRT B-024-NEB(2). 14-31-0001-4101.

Descriptors: *Nitrogen, Nitrates, Leaching, Model studies, *Soil-water-plant relationships, Sweet corn, Water balance, Irrigation.

A model was developed which describes the net changes of nitrogen amounts due to transformations and the movement, uptake, and loss of nitrogen from the root system of irrigated corn (Zea mays L.) grown on sandy soils. A potential nitrogen uptake function developed from field data is used to determine the maximum uptake for nonlimiting soil water and nitrogen availability. Actual uptake is calculated as less than potential when soil water content and/or mineral nitrogen concentration and distribution limit convective and diffusive movement of nitrate to the root system. Separate calculations are made for uptake resulting from each of these two mechanisms. Seasonal nitrogen uptake was computed within 15% of measured uptake on field plots where uptake by above ground plant material ranged from 105 to 218 kg/ha. Computed nitrate leaching losses compared favorably with losses estimated by multiplying percolation loss determined from a weekly water balance, by measured nitrate concentration at 150 cm depth. Field leaching losses estimated by the water balance-concentration method ranged from 37 to 154 kg/ha. (Skogerboe-Colorado State)

FLUCTUATIONS OF CHLOROPHYLL AND RELATED PHYSICAL PARAMETERS IN BRITISH COLUMBIA COASTAL WATERS,
British Columbia Univ., Vancouver. Inst. of Oceanography.
R. C. Wiegand, and S. Pond.
Journal of the Fisheries Research Board of Canada, Vol. 36, No. 2, p 113-121, February 1979. 7 fig, 29 ref.

Descriptors: *Water quality, *Straits, *Canada, *On-site tests, On-site investigations, Data collections, Salinity, Water temperature, Dissolved oxygen, Chlorophyll, Profiles, Spatial distributions, Water properties, Bodies of water, Analysis, Sampling, Methodology, Statistical methods, Water sampling, Fluctuations, Coasts, Analytical techniques, *British Columbia, *Strait of Georgia(British Columbia), Spectral analysis.

Continuous horizontal profiles of chlorophyll, temperature, salinity, and oxygen were made at 3 depths and in 3 locations in British Columbia coastal waters, and spectra and cross-spectra were calculated. Generally, fairly strong relationships exist between chlorophyll and temperature and salinity, especially at scales of order 10-1000 m. However, the relationships are not always expressed through the same physical parameter. It is apparent from coherence and phase data that in a turbulent environment, the vertical profiles of the parameters are important in determining the nature of the relationships. Average spectra show power law relationships similar to the results of other authors. Profiling fairly rapidly, as well as moving horizontally, would allow better resolution of both horizontal and vertical variations and was recommended for future investigations. (Humphreys-ISWS)

SPECTRAL AND BIOCHEMICAL CHARACTERISTICS OF THE PARTICULATE MATTER IN BEDFORD BASIN,
Biochimie Marine, Villefranche-sur-Mer (France). Station Zoologique.
P. Mayzaud, and S. Taguchi.
Journal of the Fisheries Research Board of Canada, Vol. 36, No. 2, p 211-218, February 1979. 3 fig, 5 tab, 24 ref.

Descriptors: *Phytoplankton, *Organic matter, *Carbohydrates, *Estuaries, Proteins, Carbon, Microorganisms, Aquatic microorganisms, Chlorophyll, Temperature, Salinity, Density, Diatoms, Dinoflagellates, Plankton, Water quality, *Bedford Basin, Copepods, Tintinnids.

A survey of the distribution, nature, and biochemical composition of particulate matter (less than 153 micrometers diam) showed that small particles (less than 18 micrometers) made up the bulk of the particulate matter during most of the summer. Relatively large amounts of microzooplankton (tintinnids) were also recorded during the period of stable hydrographic conditions. Diatoms and dinoflagellates were abundant only in early fall prior to the fall bloom. All cell counts were transformed into parts per million on a volume basis to compare with Coulter Counter data. Cell counts on preserved samples strongly underestimated the number and volume of small particles and did not take into account the detritus. Considerations of the ATP content strongly suggested that for naturally occurring particulate matter there is not a constant ATP to carbon ratio, but rather there is an upper and lower limit. Small particles were the main repository for protein, whereas phytoplankton was the repository for carbohydrates. The high variability of both quality and quantity of particles in the neritic habitat suggests that a single chemical variable cannot describe fully the nutritive value of naturally occurring suspended matter. SUMMER PLANKTON DISTRIBUTIONS ASSOCIATED WITH THE PHYSICAL AND NUTRIENT PROPERTIES OF THE NORTHWESTERN GULF OF ST. LAWRENCE,
Quebec Univ., Rimouski. Dept. of Oceanography.
J. M. Sevigny, M. Sinclair, M. I. El-Sabh, S. Poulet, and A. Coote.
Journal of the Fisheries Research Board of Canada, Vol. 36, No. 2, p 187-203, February 1979. 14 fig, 2 tab, 28 ref.

Descriptors: *Plankton, *Nutrients, *Physical properties, *Gulfs, *Estuaries, *St. Lawrence River, Sampling, Surveys, Data processing, Phytoplankton, Diatoms, Dinoflagellates, Aquatic microorganisms, Biomass, Currents(Water), Water circulation, Density, Salinity, Phosphates, Silicates, Nitrates, Water quality, *Gulf of St. Lawrence, Copepods.

Two transects, north-south and east-west, through the Anticosti gyre and the Gaspe current were sampled for physical properties, nutrient, and plankton concentrations over a 5-day period during July 1976. Temperature, salinity, sigma sub t and nutrient isolines formed a dome characteristic of cyclonic circulation with the apex within the Anticosti gyre, but a strong shallow thermocline prevented nutrient enrichment of the surface mixed layer. Surface nitrate and silicate concentrations were very low, except for 2 anomalies throughout the region sampled, with phosphate concentrations higher. Phytoplankton biomass was uniformly low and dominated by nannoplankton (less than 15 micrometers) was important and the total biomass considerably higher. The higher biomass and importance of larger celled species suggest higher nutrient turnover in the Gaspe current. Nitzschia delicatissima dominated the species composition in the Gaspe current, dinoflagellates and microflagellates being of more importance within the gyre and along the north shore. Zooplankton biomass was distributed fairly uniformly over the entire region, but species composition at the shallower stations was characterized by small copepod species and fish larvae, the gyre stations being characterized by larger copepod species, euphausids, and decapod larvae. DISTRIBUTION OF NUTRIENTS IN THE GULF OF ST. LAWRENCE,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Atlantic Oceanographic Lab.
A. R. Coote, and P. A. Yeats.
Journal of the Fisheries Research Board of Canada, Vol. 36, No. 2, p 122-131, February 1979. 11 fig, 1 tab, 20 ref.

Descriptors: *Nutrients, *Distribution patterns, *Gulfs, *Estuaries, *St. Lawrence River, Sampling, Surveys, Data processing, Silicates, Nitrates, Phosphates, Winter, Summer, Water quality, Path of pollutants, Sediments, *Gulf of St. Lawrence.

The general pattern of nutrient distribution in the Gulf of St. Lawrence results from regeneration processes being superimposed on the physical processes of estuarine circulation within the Gulf. This leads to a general increase in nutrient concentration with depth and with distance into the Gulf from Cabot Strait. Nutrient concentrations in the Laurentian Channel are higher inside the Gulf than at equal or even greater depths in the Atlantic Ocean some distance outside Cabot Strait. Summer nutrient concentrations in the surface layer are generally low. However, during the winter when biological activity is low, quite high concentrations of the nutrients are found in the surface waters of the Gulf. A balance exists between inward and

outward fluxes of all 3 nutrients through Cabot Strait in the winter. However, in the summer, the influxes of both nitrate and silicate at Cabot Strait greatly exceed the outgoing fluxes. Losses of biogenic silica to the sediments may account for the silicate imbalance. Excess nitrate may be accounted for if ammonia or nitrogen bound with dissolved organics had been measured. CARBON AND OXYGEN ISOTOPE RATIOS IN THE SAGUENAY FJORD AND THE ST. LAWRENCE ESTUARY AND THEIR IMPLICATIONS FOR PALEOENVIRONMENTAL STUDIES,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Atlantic Oceanographic Lab.
P. M. Strain, and F. C. Tan.
Estuarine and Coastal Marine Science, Vol. 8, No. 2, p 119-126, February 1979. 3 fig, 3 tab, 13 ref.

Descriptors: *Isotope studies, *Estuaries, *St. Lawrence River, *Canada, Carbon, Oxygen, Carbon dioxide, Sampling, Surveys, Mathematical models, Paleoclimatology, Water temperature, Salinity, Climatology, *St. Lawrence Estuary, *Saguenay Fjord.

Surface water samples (1 m depth) from the Saguenay Fjord and the upper St. Lawrence Estuary were analyzed for delta 13C, Sigma C02, and delta 180. In the Saguenay Fjord, the delta 13C sub PDB and concentration of the total dissolved C02 varied from -10.9 parts per thousand and 3.6 ml/l near the head to -0.4 parts per thousand and 30.3 ml/l at the mouth. The upper St. Lawrence Estuary exhibited a delta 13C range of -4.2 to -1.6 parts per thousand and a sigma C02 concentration range of 19.8 to 37.6 ml/l. The measured delta 13C, sigma C02, delta 180 and salinity distributions were compared to a conservative mixing model. The excellent agreement between the measured and predicted delta 13C values in the Saguenay Fjord indicated that the carbon isotope ratio behaves conservatively. In the upper St. Lawrence Estuary, the much poorer agreement suggested that significant in situ processes involving the dissolved C02 are operative. The suggestion that estuarine paleotemperatures may be obtained by extrapolating delta 13C - delta 180 shell carbonate curves to marine conditions is open to criticism. The delta 13C - delta 180 water curves observed in this work illustrated two different situations that could produce errors in paleotemperatures estimated by this method. (Sims-ISWS)

CONCENTRATIONS AND TEMPORAL VARIATIONS OF 210PO, 210PB, AND AL IN THE SURF ZONE ECOSYSTEM OF COPALIS BEACH, WASHINGTON,
Washington Univ., Seattle. Dept. of Oceanography.
J. T. Bennett, and R. Carpenter.
Estuarine and Coastal Marine Science, Vol. 8, No. 2, p 127-140, February 1979. 2 fig, 3 tab, 38 ref. ERDA E(45-1)-2225-TA24, EPA T900313-04.

Descriptors: *Diatoms, *Lead, *Aluminum, *Surf, *Washington, Benthos, Beaches, Coasts, Phytoplankton, Isotope studies, Sampling, Surveys, Seasonal, Aquatic microorganisms, Aquatic life, *Copalis Beach(WA), *Polonium.

Surf diatoms monitored during a 21-month period at Copalis Beach, Washington, contained elevated concentrations of Al, 210Pb, and supported 210Po compared to net phytoplankton from Washington coastal waters and Puget Sound. Aluminum concentrations of several percent dry weight found in the surf diatoms were not a reflection of contamination by discrete inorganic particulate matter but were the result of a natural coating of clay-sized particles on Chaetoceros armatum, the predominant diatom in the surf blooms. A high correlation between Al and 210Pb in the surf diatoms suggests that 210Pb and supported 210Po were also associated with the clay-sized particles. During fall through spring, the unsupported 210Po concentrations in the surf diatoms were correlated with the input of 210Po by precipitation. A summer maximum in unsupported 210Po concentrations in the surf diatoms may reflect upwelling that causes higher dissolved 210Po concentrations in the summer surf relative to those of late spring and early fall. The consumers of the surf diatoms exhibited larger 210Po-activity-to-210Pb-activity ratios than their food, indicating 210Po was preferentially accumulated in the higher trophic level. (Sims-ISWS)

SEASONAL FLUCTUATIONS IN COASTAL BENTHIC INVERTEBRATE ASSEMBLAGES,
Delaware Univ., Lewes. Marine Studies Complex.
D. Maurer, W. Leathem, P. Kinner, and J. Tinsman.
Estuarine and Coastal Marine Science, Vol 8, No 2, p 181-193, February 1979. 3 fig, 6 tab, 20 ref.

Descriptors: *Marine animals, *New York, *New Jersey, *Invertebrates, *Benthic fauna, *Atlantic Ocean, Sediments, Benthos, Sampling, Surveys, Marine biology, Classification, Data processing, Seasonal, Biology.

During 4 quarterly sampling cruises at 2 areas off the Delaware coast, 288 quantitative benthic invertebrate samples were collected. Species composition, species dominance (abundance and frequency of occurrence), density, and species evenness were compared. Based on cluster analysis, 3 species-site groups emerged: (1) a high energy shoal assemblage characterized by a year-round suite of haustoriids and a few bivalves, (2) a mixed hard bottom-sand assemblage that featured marked seasonal dominance of Mytiilus edulis with a variety of seasonal epifaunal and infaunal species, and (3) a medium sand assemblage with a variety of seasonal infaunal species. Similar assemblages have been recognized off New Jersey and New York. Seasonal fluctuations in undisturbed coastal invertebrate assemblages can be so marked that many environmental impact studies are inadequate to assess the effects of human activities. (Sims-ISWS)

METEOROLOGICAL FORCING OF COASTAL WATERS BY THE INVERSE BAROMETER EFFECT,
Harbor Branch Foundation, Fort Pierce, FL.
N. P. Smith.
Estuaries and Coastal Marine Science, Vol 8, No 2, p 149-156, February 1979. 3 fig, 13 ref.

Descriptors: *Water levels, *Atmospheric pressure, *Gulf of Mexico, *Texas, *Florida, Tides, Variability, Winds, Pressure, Atmosphere, Coasts, Time series analysis, Analytical techniques, Data processing, Data collections, Oceanography, Air-sea interaction.

Water level and surface pressure data from the northeastern and northwestern Gulf of Mexico were used to investigate the water level response to meteorological forcing by the inverse barometer effect. Statistically significant coherence-squared values were computed for variations in cross-Gulf surface pressure and water level differences over time scales on the order of 2 to 6 days. Water level variations of approximately + or -4-5 cm were postulated for the northern Gulf of Mexico in response to surface pressure differences. Meteorological forcing by the inverse barometer effect appeared to be significantly greater in the winter months, when cross-Gulf air pressure differences of up to + or -20 mb were recorded. VENICE: SEA-LAGOON EXCHANGE IN A MODIFIED TIDE RANGE,
Consiglio Nazionale delle Richerche, Venice (Italy). Lab. per lo Studio della Dinamica delle Grandi Masse.
O. Vittori, and F. Tampieri.
Science, Vol. 204, No. 4390, p 261-264, April 20, 1979. 2 fig, 19 ref.

Descriptors: *Tidal waters, *Lagoons, *Model studies, *Water quality, *Europe, Analytical techniques, Salinity, Water levels, Tides, Tidal effects, Mathematical models, Freshwater, Water level fluctuations, Inlets(Waterways), Foreign research, Estuaries, *Italy, *Venetian Lagoon(Italy).

Salinity and tide heights recorded for a month at P, a point in the northern section of the Venetian lagoon, are the basic experimental data used to construct a numerical model which describes the salinity variations at P as a function of the tides measured at the Lido entrance. The time variation of the salinity pattern was interpreted in terms of a lagoon system in which a freshwater source of constant intensity is in a quasi-steady equilibrium with a tide-modulated sink. The mean residence time of a contaminant in this simulated lagoon was predicted from the change in the salinity pattern due to a reduction in the entrance size. The limits of the present results were set by the limitation of the available data and by the consequent necessity of highly simplified modeling. The data may not be sufficient to properly represent P. However, owing to the lack of a large-scale study and the necessity for the Italian government to make a decision within a short time, it was considered necessary to present the simplified modeling approach. This approach has the purpose of producing evidence that a nonlinear effect may occur in the sea-lagoon exchange as a consequence of a reduction in the entrance size. Moreover, it supports the action of those, in Italy and elsewhere, who require that pollution concentrations in the Venetian lagoon be quantitatively predicted before any permanent change in the lagoon tide regime is made. TEMPERATURE FINE STRUCTURE NEAR THE SEA-ICE MARGIN OF THE CHUKCHI SEA,
Naval Postgraduate School, Monterey, CA. Dept. of Oceanography.
R. G. Paquette, and R. H. Bourke.
Journal of Geophysical Research, Vol. 84, No. C3, p 1155-1164, March 20, 1979. 15 fig, 1 tab, 24 ref. N66001-76-PO-00610.

Descriptors: *Water temperature, *Sea ice, *Salinity, Surveys, Sampling, On-site investigations, Ice, Melting, Oceans, Temperature, Distribution patterns, Temporal distribution, Spatial distribution, Variability, Oceanography, *Chukchi Sea.

Temperature fine structure with peak-to-peak fluctuations often exceeding 2C is prevalent throughout the marginal sea-ice zone of the shallow Chukchi Sea in midsummer. It is normally found within 20-35 km outside of the ice and seldom farther than 5-10 km inside the ice margin. It has also been infrequently found more than 100 km south of the ice. Temperature and salinity fronts of all degrees of sharpness occur in the same general area, but the two types need not be coincident. Considerable variability in time and length scales of fine structure elements has been noted with persistences ranging from 2 hours or less to more than 20 hours

and length scales ranging from 600 m to more than 20 km. While much of this variability is intrinsic, part can be accounted for by the inability to sample in the direction of flow and the relative motion between the sampling platform and fine structure element. Fine structure lenses are considerably longer parallel to the ice edge, with similarity in temperature structure noted over distances of 80 and 100 km. (Sims-ISWS)

A DYNAMICAL ANALYSIS OF CURRENTS NEAR THE NEW JERSEY COAST,
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
J. R. Bennett, and B. A. Magnell.
Journal of Geophysical Research, Vol. 84, No. C3, p 1165-1175, March 20, 1979. 9 fig, 2 tab, 6 ref. BNL 357213-S.

Descriptors: *Ocean currents, *Currents(Water), *New Jersey, *Coasts, *Model studies, Mathematical models, Winds, Circulation, Water circulation, Ocean circulation, Shores, Oceans, Shear, Stress, On-site investigations, On-site data collections, Data processing, Analytical techniques, Oceanography, *New York Bight.

A numerical model was used to analyze currents measured on the continental shelf near the shore of New Jersey. The model neglected longshore variations of current and all variations of density, but it included inertial accelerations and a nonlinear eddy viscosity. Local wind stress, sea level changes, and a constant longshore pressure gradient were the forcing terms. The model successfully reproduced most of the current variances. However, the predicted currents did not exhibit the dominant 4-hour response time of the observed currents, and the model sometimes missed energetic current events. These differences were ascribed to three-dimensional setup effects elsewhere in the New York Bight. (Sims-ISWS)

THE MEASUREMENT OF INTERACTIVE FRESHWATER AND TIDAL FLOWS IN THE RIVER DEE, NORTH WALES,
Welsh National Water Development Authority, Cardiff. Dee and Clwyd Sewage Div.
A. E. Weston.
Journal of the Institution of Water Engineers and Scientists, Vol. 33, No. 1, p 69-79, January 1979. 8 fig, 1 ref.

Descriptors: *Rivers, *Tidal waters, *Estuaries, *Water levels, Tidal effects, Freshwater, Discharge(Water), Tides, Data collections, On-site investigations, Analytical techniques, Chlorides, Water quality, Saline water intrusion, Tidal streams, Watersheds(Basins), Rating curves, Foreign research, Foreign countries, *Wales, *River Dee(Wales), Flow reversal.

The area of interaction between tides and freshwater flows ranges from Hilbre Island, at the mouth of the Dee Estuary, to Pickhill, 70 km inland and 30 km upstream of the ancient weir at Chester, which greatly influences the hydraulics of the reach. Freshwater flows down the Dee would normally vary naturally between 2 and 180 cu m/sec, and tide levels at Liverpool (equivalent to the mouth of the estuary) vary from 6.24 m AOD Newlyn (at a return period of 1 in 100 years) to 1.60 m AOD Newlyn at neap tides. The Dee, being a regulated river, supports continuous abstractions by statutory water undertakings of 6 cu m/sec at present from the lower reaches upstream of Chester Weir. This will rise to 8.5 cu m/sec by the early 1980's, making the Dee the largest single source of potable water in Wales or Northern England. In addition, industrial abstractions of 4.5 cu m/sec take place from the estuary downstream of Chester Weir. The paper discussed the development of operational systems needed to forecast tidal peaks, tidal-affected river levels, and saline intrusions from a series of relatively simple hydrometric and chemical measurements. Although there is considerable scope for the extension of this work into a computer-based mathematical modelling system, the value of accurate basic measurements, interpreted rationally and presented concisely, should not be underestimated. The paper indicated how a quantitative understanding of the relationship between tidal and freshwater flows in the lower Dee has been gained from simple but precise hydrometric observations and standard chemical sampling. With the exception of the ultrasonic discharge meter, no large capital investment has been necessary. The results obtained provide a useful set of simple operational prediction methods which are extensively used in the Authority's day-to-day management of the Dee system. The work could also form a basis for the development and refinement of any mathematical model of the tidal section of the river. (Humphreys-ISWS)

EXPERIMENTAL NUMERICAL SIMULATION OF UNSTEADY WATER FLOW IN A MULTIBRANCH RIVER DELTA,
V. V. Ivanov, and Ye. P. Kotrekhov.
Soviet Hydrology: Selected Papers, Vol. 16, No. 2, p 141-150, 1977. 4 fig, 4 tab, 9 ref. Translated from Transactions of the Arctic and Antarctic Scientific Research Institute (Trudy AANII), Vol. 314, p 16-35, 1976.

Descriptors: *Estuaries, *Rivers, *Unsteady flow, *Model studies, Deltas, Flow, Mathematical models, Theoretical analysis, Analytical techniques, Foreign research, Discharge(Water), Tidal waters, Waves(Water), Water levels, Wind tides, Water level fluctuations, *USSR, *Kolyma Estuary(USSR), Multibranch river delta.

The most suitable among the computation methods developed in the USSR for creating a mathematical model of an intricately branching delta is that of the Institute of Hydrodynamics of the Siberian Branch of the USSR Academy of Sciences. This method (IH) has been used successfully to study the interaction between aperiodic sea level fluctuations and river runoff on a numerical model of a single-arm estuary. The estuary of the Kolyma River was used to investigate the possibility of applying the modification of the IH method to the mathematical simulation of unsteady water flow in a multibranch delta. To describe one-dimensional flow in a river estuary, the St. Venant equations were written for an arbitrary system of channels. The computation scheme and the initial data forming the basis of the mathematical model of the Kolyma estuary were presented. The use of numerical simulation of the water regime of intricately branched deltas, based on methods of computation of unsteady flow, makes it possible to obtain the characteristics of one-dimensional flow. The method investigated makes it possible to supplement existing information and sometimes to obtain completely new information on the hydraulic regime of flow in the intricately branched deltas of large rivers. In this case, one can investigate some important patterns along river estuaries of propagation of long waves produced by wind set-up, floods, and tides. All this indicates the great potential of the method for solving some practical problems associated with water transport, hydraulic power engineering, and other branches of industry. (Humphreys-ISWS)

DESIGN WAVE HEIGHT AND WAVE PERIOD OF SEA WAVES AT DIGHA,
River Research Inst., Calcutta (India). Haringhata Central Lab.
S. K. Daskaviraj, and S. K. Sarkar.
Indian Journal of Meteorology, Hydrology and Geophysics, Vol. 29, No. 3, p 541-546, July 1978. 9 fig, 6 ref.

Descriptors: *Waves(Water), *Ocean waves, *Beaches, Design data, Statistics, Probability, Measurement, Frequency, Data processing, Curves, Coasts, Coastal engineering, *India, *Digha(India), Design wave height.

The most probable height and period of the waves which will occur in any given length of time were determined from systematic instrumental records of sea waves at Digha. In determining the design wave height and wave period the method as suggested by Draper was used. Cumulative distribution of the highest and the significant wave heights and the distribution of wave periods in percentage of occurrence also were presented. (Sims-ISWS)

AN ENVIRONMENTAL SURVEY OF CANTON ATOLL LAGOON, 1973,
Naval Undersea Center, Kailua, HI. Hawaii Lab. Available from the National Technical Information Service, Springfield, VA 22161 as AD-A028 023, Price codes: A09 in paper copy, A01 in microfiche. Final Report NUC TP 395, Naval Undersea Center, Hawaii Laboratory, Kailua, Hawaii, June 1976, 200 p. Smith, S. V. and Henderson, R. S., editors. DOAF, MIPR FY7616-74-00-202, EPA R800906.

Descriptors: *Atolls, *Lagoons, *Water quality, *Geomorphology, *Aquatic environment, Tidal waters, Biota, Aquatic life, On-site investigations, Hydrologic budget, Reefs, Coral, Surveys, Analytical techniques, Suspended solids, Water properties, Groundwater, Surface waters, Estuaries, *Canton Atoll.

Canton Atoll has a single passage between the ocean and lagoon and has conspicuous environmental gradients from that passage to the back lagoon. These gradients include the physiography of the lagoon floor, water quality, and the diversity and abundance of corals, fishes, and mollusks. The gradients apparently can be attributed either directly or indirectly to circulation and water motion within the lagoon. Those oceanographic characteristics, in turn, can be attributed to the geological history of the atoll, including some human modification of the pass configuration. In addition to the studies of the atoll lagoon, the characteristics of the groundwater system were noted. Evidence from isolated standing water bodies on the atoll demonstrates that these features show considerable variability, which may be attributed to a combination of the immediately previous history of these bodies as well as to the physiography of the atoll. CANTON ATOLL LAGOON PHYSIOGRAPHY AND GENERAL OCEANOGRAPHIC OBSERVATIONS,
Naval Undersea Center, Kailua, HI. Hawaii Lab.
R. S. Henderson, P. L. Jokiel, S. V. Smith, and J. G. Grovhoug.
In: An Environmental Survey of Canton Atoll Lagoon, 1973. Final Report NUC TP 395, Naval Undersea Center, Hawaii Laboratory, Kailua, Hawaii, p 5-14, June 1976. 6 fig, 2 ref.

Descriptors: *Atolls, *Lagoons, *Geomorphology, *Tidal waters, Tides, Reefs, Dredging, Inlets(Waterways), Surveys, Water circulation, On-site investigations, Water levels, *Canton Atoll.

The 4 major physiographic zones of the Canton Atoll lagoon are defined as the Pass Zone, the Line Reef Zone, the Back Lagoon Zone, and the Altered Zone. Each of these zones has a characteris-

ic physiography, biota, and water quality. The Altered Zone is noteworthy, because it appears to ıave originated from the degradation of other :ones brought about by dredge and fill operations. There does not appear to be any other major rtificial damage to the lagoon, aside from direct nechanical destruction by dredging. The predomiıant aspects of lagoon circulation are wind drift nd tidal flow. Although lagoon tides show a ronounced lag with respect to the ocean tides, here is no measurable amplitude attenuation from he ocean to the back lagoon. (See also W79-6881) (Humphreys-ISWS)

WATER COMPOSITION AND BIOGEOCHEMICAL GRADIENTS IN THE CANTON ATOLL LAGOON,
Naval Undersea Center, Kailua, HI. Hawaii Lab.
. V. Smith, and P. L. Jokiel.
n: An Environmental Survey of Canton Atoll Lagoon, 1973. Final Report NUC TP 395, Naval Undersea Center, Hawaii Laboratory, Kailua, Hawaii, p 15-53, June 1976. 19 fig, 6 tab, 51 ref.

Descriptors: *Atolls, *Lagoons, *Water properties, On-site investigations, Water quality, Sedimentation, Analysis, Analytical techniques, Aquatic environment, Tidal waters, Hydrologic budget, Salinity, Nutrients, Evaporation, Mathematical models, Nutrient removal, Phosphorous, Water sampling, Calcium carbonate, Alkalinity, Chlorophyll, Nitrates, Ammonia, *Canton Atoll.

udgets of water, salt, nutrients, carbon dioxide, ıspended material, and sediments can be used to stablish the dynamics of water exchange, biogeohemical reactions, and sedimentation in the anton Atoll lagoon. Maximum water residence me in the lagoon is about 95 days. During that me, net evaporation raises the salinity nearly 4 arts per thousand above oceanic values. Phospho-ıs utilization in the lagoon is 0.027 mmole/sq m/ ay; nitrogen utilization is about 8.5 times this rate. et excess organic carbon production is assumed be 100 times the rate of phosphorus utilization hat is, about 3 mmole/sq m/day, or 36 mg C/sq /day). Gross production, as inferred from gas xchange between the air and water, is 6 g C/sq /day. CaCO3 production is 14 mmole/sq m/day, r 1.4 g CaCO3/sq m/day. Most of the CaCO3 roduced in the lagoon remains there, but a subantial portion of the organic carbon produced is st from the lagoon. Water motion is the paramer exerting major influence on the metabolism of e lagoon biotic community. Artificial alteration f water movement patterns has changed part of at community. Neither nitrogen nor phosphorus likely to limit metabolism of the biota. CaCO3 roduction in the lagoon has probably been suffient to fill the lagoon with about 20 m of sediment ver the past 8,000 years. It is likely that the esent episode of lagoon reef growth has been ntinuing for that timespan and that the CaCO3 roduction rate has decreased substantially over at period. EEF CORALS OF CANTON ATOLL: I. ZOOEOGRAPHY,
aval Undersea Center, Kailua, HI. Hawaii Lab.
E. Maragos, and P. L. Jokiel.
: An Environmental Survey of Canton Atoll agoon, 1973. Final Report NUC TP 395, Naval ndersea Center, Hawaii Laboratory, Kailua, awaii, p 55-70, June 1976. 3 tab, 19 ref.

escriptors: *Pacific Ocean, *Indian Ocean, Atolls, *Geomorphology, *Reefs, *Surveys, On-e investigations, Tidal waters, Coral, Marine anials, Aquatic life, Data collections, *Phoenix land, *Canton Atoll, Coral fauna, Hermatypic orals, Ahermatypic corals.

his paper described the hermatypic and ahermapic corals collected at Canton Atoll in 1972 and 73. Over 75 species and 36 genera and subgenera reef corals were reported. When combined with e new records reported at McKean Atoll, these records nearly double the number of species and genera previously reported for the Phoenix Islands. Although the Phoenix Island coral fauna is considerably more diverse than previously estimated and more diverse than reported for island groups to the east, island groups to the west show much higher coral diversities. These findings are consistent with the overall trend, previously noted by Wells and others, of a decreasing number of coral species and genera from west to east across the tropical Pacific. Investigations also revealed that significant dissimilarities exist between the species and generic lists of Canton and adjacent islands and island groups in the Central Pacific. Although some of the apparent discontinuities in the distribution of certain corals may be artifacts resulting from variable or incomplete sampling, some are apparently real. The causes for the local suppression of certain genera and species from some islands and their abundance on others nearby are unknown but are probably related to geographic isolation or variations in the local rates of immigration and extinction of coral species. Comparison of the Phoenix data with previously reported coral distributions in the Indian Ocean seemed to support the theory that the Indo-Pacific reef coral fauna shows a homogenous distribution. REEF CORALS OF CANTON ATOLL: II. LOCAL DISTRIBUTION,
Naval Undersea Center, Kailua, HI. Hawaii Lab.
P. L. Jokiel, and J. E. Maragos.
In: An Environmental Survey of Canton Atoll Lagoon, 1973. Final Report NUC TP 395, Naval Undersea Center, Hawaii Laboratory, Kailua, Hawaii, p 71-97, June 1976. 7 fig, 10 tab, 18 ref.

Descriptors: *Surveys, *Atolls, *Reefs, *Geomorphology, Coral, Aquatic animals, Ecological distribution, On-site investigations, Spatial distribution, Water quality, Salinity, Tidal waters, Analysis, Analytical techniques, Data collections, Sediments, *Canton Atoll, Lagoon fauna.

Although undoubtedly of great importance as reef-formers, corals occupy only a few percent of the total bottom area at Canton Atoll. Distribution and abundance of the 77 reported species of reef corals at Canton appear to be controlled largely by biological interaction (that is, competition for space) at intermediate depths on the ocean reef slope and largely by physical factors (increased salinity, sedimentation, and turbidity; decreased water motion; and possibly available nutrients) in the lagoon. Coral coverage and number of species present in the lagoon decrease with increasing distance from the single passage where lagoon water exchanges with the open ocean. Canton is geographically isolated from atolls having extensive lagoon systems. Furthermore, exchange of lagoon water with the open ocean is confined to one passage along the atoll rim. Consequently, the lagoon fauna lacks 'exclusively lagoon' species of corals. Apparently the lagoon reefs have been colonized by a few of the abundant ocean-reef species. Widespread Indo-Pacific species belonging to the genera Pocillopora, Acropora, Montipora, and Millepora account for much of the coral coverage. In addition, several species uncommon elsewhere (including Hydnophora rigida and Halomitra philippinensis) account for an unusually large portion of the total coverage in some habitats. An abundance of fungiid species (8 genera and subgenera) is one of the most striking and unusual features of the coral fauna, along with an extensive lagoon line reef system dominated by Millepora. W79-06885

DISTRIBUTION OF INSHORE FISHES AT CANTON ATOLL,
Naval Undersea Center, Kailua, HI. Hawaii Lab.
J. G. Grovhoug, and R. S. Henderson.
In: An Environmental Survey of Canton Atoll Lagoon, 1973. Final Report NUC TP 395, Naval Undersea Center, Hawaii Laboratory, Kailua, Hawaii, p 99-157, June 1976. 7 fig, 2 tab, 15 ref, 1 append.

Descriptors: *Fish, *Surveys, *Atolls, *Aquatic animals, On-site investigations, Methodology, Reefs, Analysis, Saline water fish, Ecological distribution, Distribution patterns, Tidal waters, Data collections, *Canton Atoll, Fish fauna.

Inshore fishes at Canton were surveyed by visual sampling during a 2-week period in November and December 1973. Data from this survey expand the cumulative checklist for Canton Atoll fish species to 264 species from 50 families. The distribution of inshore fishes was analyzed from transect data, and 20 species were selected for representative distributional display. Several representative patterns of fish distribution emerge. Fish abundance (both individuals and species) is highest immediately outside and in the pass region. In the lagoon, abundance decreases with increasing distance from the pass. Fish transect and observational data were included in an appendix. (See also W79-06881) (Humphreys-ISWS)
W79-06886

MOLLUSCAN DISTRIBUTION PATTERNS AT CANTON ATOLL,
Naval Undersea Center, Kailua, HI. Hawaii Lab.
E. A. Kay.
In: An Environmental Survey of Canton Atoll Lagoon, 1973. Final Report NUC TP 395, Naval Undersea Center, Hawaii Laboratory, Kailua, Hawaii, p 159-169, June 1976. 4 fig, 2 tab, 4 ref.

Descriptors: *Mollusks, *Atolls, *Aquatic animals, *Surveys, Gastropods, Distribution patterns, Lagoons, Tidal waters, Reefs, Ecological distribution, Data collections, Sampling, Methodology, On-site investigations, *Canton Atoll, Bivalves.

Micromollusks in sediment samples from Canton Atoll were described in terms of 3 assemblages: seaward reef; outer, clear water lagoon; and inner, turbid water lagoon. The seaward reef and outer lagoon assemblages are characterized by low standing crops, high species diversity, and a preponderance of microherbivores, in contrast to the inner lagoon, where there are higher standing crops, lower species diversity, and a strong tendency toward suspension feeding. The dominant gastropods in the lagoon are members of the family Diastomidae, including Diala flammea and species of Obtortio and Scaliola. The dominant bivalves are cardiids. The assemblages at Canton resemble those from Fanning Atoll in general aspects, such as standing crops, species diversity, and trophic structure, but differ noticeably in species composition. Differences in species composition are suggested to be associated with differences in water chemistry. (See also W79-06881) (Humphreys-ISWS)
W79-06887

OBSERVATIONS ON TERRESTRIAL SURFACES AND SUBSURFACE WATER AS RELATED TO ISLAND MORPHOLOGY AT CANTON ATOLL,
Naval Undersea Center, Kailua, HI. Hawaii Lab.
E. B. Guinther.
In: An Environmental Survey of Canton Atoll Lagoon, 1973. Final Report NUC TP 395, Naval Undersea Center, Hawaii Laboratory, Kailua, Hawaii, p 171-183, June 1976. 2 fig, 2 tab, 4 ref.

Descriptors: *Surveys, *Water resources, *Atolls, Water quality, Geomorphology, Salinity, Water sampling, On-site investigations, Tidal waters, Tidal effects, Nutrients, Chlorophyll, Data collections, Groundwater, Lagoons, *Canton Atoll.

Reconnaissance sampling of isolated bodies of water on Canton Island revealed a pattern in salinities related to the physiography of the channels and flats of the island. Moderate salinities between 13 and 18 parts per thousand typified channelbed ponds, while lower salinities (less than 8 parts per thousand) typified potholes and water-filled burrows on the surrounding flats. Highest salinities (greater than 24 parts per thousand and up to 152 parts per thousand) were encountered in two larger ponds, in lagoon tidal channels, and in a saltern. A wide variation in concentration of nutri-

ents and chlorophyll a suggests ecological dissimilarities stemming either from salinity differences where such differences are great or from variations in biological community development owing to vagaries in colonization or previous environmental histories or both. TIME-STEPPING SCHEMES FOR FINITE ELEMENT TIDAL MODEL COMPUTATIONS,
Princeton Univ., NJ. Dept. of Civil Engineering.
W. G. Gray, and D. R. Lynch.
Advances in Water Resources, Vol. 1, No. 2, p 83-95, December 1977. 22 fig, 16 ref.

Descriptors: *Finite element analysis, *Tidal models, *Surface waters, Analytical techniques, Equations, Propagation factor.

A number of temporal procedures for solving the long-wave surface water equations using the finite element method in space are presented and analyzed. The analysis determines the stability of the schemes and the error in wave amplitude and phase that can be expected. The computational efficiency of the various methods is also discussed. The results of this analysis indicate types of errors that might be manifested in finite element surface water modeling using the different schemes. (Bell Graf-Cornell)

3A. Saline Water Conversion

RESEARCH ON SALINE WATER CONVERSION BY FREEZING,
Massachusetts Inst. of Tech., Cambridge.
T. K. Sherwood, and P. L. T. Brian.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-197 790, Price codes: A05 in paper copy, A01 in microfiche.
OSW Research and Development Progress Report No 179, June 1966. 78 p, 27 fig, 5 tab, 29 ref. 14-01-0001-295.

Descriptors: *Desalination, *Desalination processes, *Freezing, Laminar flow, Membranes, Membrane processes, Crystal growth, Nucleation, Kinetics, Particle size, Additives, Ice-water interfaces, Saline water, Aqueous solutions, Diffusion, Flash freezing, Mass transfer, Heat transfer, Separation techniques, Water treatment, Water purification.

Progress in six areas of research on the desalination of aqueous solutions by freezing is summarized. The theoretical analysis of salt concentration build-up was extended to include laminar flow in round tubular membrane channels. It is concluded that for a reliable analysis it seems that the effluent concentration must be related to the membrane surface concentration. The study of the kinetics of ice crystal growth from supercooled water investigated whether small amounts of impurities added to the water altered growth kinetics. It was found that small concentrations of dissolved impurities in supercooled water do not greatly alter the kinetics of growth generally, but some concentrations of ammonium iodide and poly (acrylic acid) appear to reduce the growth velocity over the entire range of kinetics studied. The results and conclusions of previously published experimental work in washing brine from ice crystals are interpreted. The formation of ice crystal growth was studied in freezing saline water by direct contact with an immiscible refrigerant. An approximate theoretical analysis is presented for the influence of salt diffusion and of heat diffusion on the growth rate of ice crystals in undercooled saline water. Flash freezing of saline water and heat and mass transfer to small particles are two research programs still in their initial stages of development. (Davison-IPA)

MEMBRANE PHENOMENA,
Brooklyn Polytechnic Inst., NY.
H. P. Gregor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-177 208, Price codes: A06 in paper copy, A01 in microfiche.
OSW Research and Development Progress Report No 193, May 1966. 101 p, 34 fig, 10 tab, 55 ref. 14-01-0001-319.

Descriptors: *Membranes, *Desalination, *Desalination apparatus, Permselective membranes, Films, Polymers, Plastics, Cation exchange, Anion exchange, Permeability, Diffusion, Electrolytes, Physical properties, Chemical properties, Laboratory tests, Porosity, Hydraulic properties, Water treatment, Separation techniques.

Detailed information on the specific properties of ion exchange membranes is presented. Various cation exchange membranes containing the sulfonic acid group were subjected to immersion tests; equilibrium and kinetic studies were made. Mean activity coefficients, diffusion coefficients, selectivity coefficients, the rate of anion exchange and the hydraulic permeability of these membranes were determined. An experimental cell was designed for work to determine polarization. The experimental results for the specific properties of cation exchange membranes and ACl anion exchange membranes are tabulated. Results are presented for diffusion coefficient of DHO in membranes, activity coefficients in polyelectrolytes, diffusion coefficients in polyelectrolytes, and hydraulic permeabilities of membranes. The theoretical discussion includes information on the calculation of pore diameters in cation exchange membranes, and calculation of electrodialytic polarization. (Davison-IPA)
W79-06571

DESALINATION BY ELECTROSORPTION AND DESORPTION,
Southern Research Inst., Birmingham, AL.
R. E. Lacey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-210 527, Price codes: A03 in paper copy, A01 in microfiche.
OSW Research and Development Progress Report No. 195, June 1966. 77 p, 24 fig, 4 tab, 1 append. 14-01-0001-409.

Descriptors: *Desalination, *Desalination processes, *Desalination apparatus, *Electrosorption, Membranes, Membrane processes, Demineralization, Electric currents, Electrodialysis, Fabrication, Costs, Economics, Separation techniques, Water treatment, Water purification.

Desalination experiments were conducted with two prototype electrosorption stacks to determine the effects of current density, feed concentration, flow rate of solution, and spacing between electrosorption membranes on demineralization performance. It was shown that, at current densities less than the limiting value, the coulomb efficiencies obtained in the electrosorption process are as high as in electrodialysis, and resistances per cell pair are about 30% lower than in electrodialysis. When current densities exceed the limiting current density, pH-sensitive salts precipitate within the electrosorption membranes; these precipitates are removed during desorption. Methods for fabricating electrosorption membranes were studied, and work in developing these membranes is continuing. The theory and mathematical expressions for the demineralization and regeneration phases have been extended. Calculations based on previous experimental data indicate that although 15 to 25% of the electrosorption process operation time is spent in membrane regeneration, the energy costs are about the same as for electrodialysis when treating the same type of water. It is further indicated that the total cost of desalination by electrosorption should be lower than that for electrodialysis because of lower capital costs. (Davison-IPA)
W79-06572

RESEARCH ON MINERAL BY-PRODUCTS FROM SALINE WATERS,
Grace (W. R.) and Co., Clarksville, MD.
M. L. Salutsky, J. Block, and M. G. Dunseth.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-186 196, Price codes: A06 in paper copy, A01 in microfiche.
OSW Research and Development Progress Report No 197, September 1966. 177 p, 16 fig, 72 tab, 45 ref, 1 append. 14-01-0001-642.

Descriptors: *Desalination, *Pre-treatment(Water), *Phosphates, *Sulfates, *Potassium, *Economic feasibility, Sea water, Saline water, Water analysis, Water chemistry, Water treatment, Chemical precipitation, Chemical reactions, Separation techniques, Desalination plants.

Continuing research on the separation of mineral constituents from sea water and other saline waters is presented. Work is reported in the following areas: (1) recovery of potassium and sodium from saline waters by precipitation as a calcium double salt; (2) recovery of potassium from saline waters with iron and aluminum phosphate; (3) recovery of potassium from saline waters by precipitation with preformed magnesium ammonium phosphate; and (4) recovery of potassium from saline waters by precipitation with preformed magnesia alba. A process flowsheet for the recovery of potassium sulfate and sodium sulfates by calcium sulfate precipitation is provided. Cost estimates for this procedure show that a byproduct credit of $.20/1000 gallons of fresh water produced would be yielded from a 10 mgpd water conversion plant. The estimated manufacturing costs and byproduct values are tabulated. The price of chemical processing and the byproduct values are nearly the same for the recovery of potassium by the ferric phosphate process. (Davison-IPA)
W79-06573

STUDY AND ANALYSIS OF THE APPLICATION OF SALINE WATER CONVERSION PROCESSES TO ACID MINE WATERS,
Maryland Univ., College Park. Dept. of Chemical Engineering.
W. C. Schroeder, and J. M. Marchello.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-177 085, Price codes: A04 in paper copy, A01 in microfiche.
OSW Research and Development Progress Report No. 199, August 1966. 73 p, 11 tab, 23 ref. 14-01-0001-645.

Descriptors: *Desalination processes, *Acid mine water, *Water costs, *Capital costs, Operating costs, Ion exchange, Membrane processes, Distillation, Crystallization, Freezing, Effluents, Separation techniques, Water treatment, Waste water treatment, Water pollution treatment, Neutralization, Grassy Run(West Virginia), Kittanning Run(Pennsylvania).

An ion exchange process, two membrane processes, three crystallization and three distillation processes were examined to determine their potential application to acid mine waters. Water costs were determined for each process based on the total estimated capital and operating costs for various sized plants. Kittanning Run near Altoona, Pennsylvania, and Grassy Run near Elkins, West Virginia, were selected as feed to the plants. Except for ion exchange, all processes considered split the feed water into fresh water product and brine effluent which contains all the acid and iron present in the original feed water. Distillation, crystallization or the membrane processes can process acid mine water in its original condition or after it has been neutralized. The processing of acid water requires the use of more costly, acid resistant construction materials. Pre-treatment of the feed water by neutralizing it with sodium carbonate is favored for crystallization, membrane process, and distillation plants because of cost consideration. This neutralized water does not necessarily provide water suitable for domestic purposes. It is concluded that the saline water conversion processes considered would not be applicable to acid mine waters, except when a municipality's water supply needed augmentation with potable water meeting Public Health standards. (Davison-IPA)

ESIGN STUDY OF A REVERSE OSMOSIS LANT FOR SEA WATER CONVERSION,
General Atomic Co., San Diego, CA.
. T. Bray, and H. F. Menzel.
vailable from the National Technical Information ervice, Springfield, VA 22161 as PB-176 288, rice codes: A06 in paper copy, A01 in microfiche. SW Research and Development Progress Report o. 176, April 1966. 98 p, 28 fig, 14 tab, 3 ref, 4 ppend. 14-01-0001-531.

escriptors: *Desalination, *Desalination plants, Desalination processes, *Desalination apparatus, Reverse osmosis, Membranes, Pilot plants, Eco-omics, Cost analysis, Estimated costs, Engineers stimates, Maintenance costs, Operating costs, apital costs, Design criteria, Separation tech-iques, Water treatment, Water purification, Sea ater, Brackish water.

s a first step in the engineering design of a everse osmosis pilot plant, a parametric study of a ne mgpd plant was undertaken to define system ressure, flow ratio between product water and rine stream, and the general flow arrangement ited for larger plant sizes. System parameters ere selected on the basis of economic consider-ions allowed by the technical aspects, and the nal selection criteria were the relative costs of ater between the systems having different param-ers. The costs were categorized as follows: nnual capital charges, pumping power, operation d maintenance, and membrane replacement. echnical and economic ground rules and assump-ons are discussed. The description of the one gpd plant includes plant layout and system subas-mblies. Capital and water costs for single and vo stage operations are tabulated. The engineer-g design of a gpd pilot plant based on data from e parametric study is presented in Part 2. The ant is a single stage unit with a 50,000 gpd roduct water capacity, a 2160 psi system design ressure, and a 1.0 brine to product water flow tio. The plant will require about 2400 modules ntaining six to seven sq ft of active membrane ea arranged in series of 20 inside 120 coated rbon steel pipes. Drawings and schematic dia-ams are included. ABRICATION AND EVALUATION OF NEW LTRATHIN REVERSE OSMOSIS MEM-RANES,
idwest Research Inst., Minneapolis, MN. North ar Research Div.
S. Francis.
vailable from the National Technical Information ervice, Springfield, VA 22161 as PB-177 083, rice codes: A04 in paper copy, A01 in microfiche. SW Research and Development Progress Report o. 177, February 1966. 53 p, 14 fig, 14 tab, 16 ref. -01-0001-457.

escriptors: *Desalination, *Desalination appara-s, *Ultrathin membranes, Fabrication, Labora-ry testing, Polymers, Plastics, Distillation, Per-eability, Semipermeable membranes, Separation chniques, Water treatment, Water purification.

olymers with a broad range of chemical struc-res were used in devising methods to form ultra-in membranes. Membrane manipulation methods d testing procedures were developed which al-wed a large number of flux and desalination easurements to be made on membranes of esti-ated thicknesses between 1400 and 5000 ang-oms. Flux and desalination properties were de-rmined for ultrathin polymeric membranes con-ning the following groups: ester, ether and etal, nitrate ester, nitrile, urethane, chlorinated her, aromatic and hydroxyl. Except for chlorin-ed polyether, all were permeated by water and jected significant portions of salt. Annealing, sol-nt vapor exposure, membrane drying, and partial ractionation were investigated as treatments to crease membrane permeability or salt rejection. he results showed wide ranges of permeability d salt rejection, but as one property improved, e other suffered. Data obtained from infrared ectra of annealed and unannealed membranes d an X-ray pattern from a multilayered annealed cellulose acetate specimen are being analyzed. Results of these investigations indicate that the ultrathin membrane is a feasible approach for the study of film morphology and desalination mechanisms, and that the ultrathin membrane would be amenable to commercial production. (Davison-IPA)

RESEARCH ON SALINE WATER CONVERSION BY FREEZING AND REVERSE OSMOSIS,
Massachusets Inst. of Tech., Cambridge.
T. K. Sherwood, P. L. T. Brian, and A. F. Sarofim.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-177 205, Price codes: A05 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 180, May 1966. 85 p, 27 fig, 6 tab, 28 ref, 2 append. 14-01-0001-546.

Descriptors: *Desalination, *Desalination processes, *Reverse osmosis, *Freezing, Polarization, Mass transport, Membrane processes, Flow, Laminar flow, Turbulent flow, Nucleation, Crystal growth, Ice-water interfaces, Evaporation, Particle size, Light penetration, Separation techniques, Water treatment, Water purification.

Progress in seven areas of investigation is reported. Results of experimental studies of concentration polarization at a membrane surface in forward and reverse osmosis substantiate earlier theory and further clarify the understanding of the mechanism of salt and water transport through cellulose acetate membranes. Results of previously published theoretical analysis were used to present concentration polarization ratios for reverse osmosis systems operating at a variety of conditions including laminar and turbulent flow in tubular membranes. Progress in a preliminary study of the nucleation and growth of ice crystals in direct contact cooled brine with iso-butylene is summarized. Quantitative results have not yet been obtained in the investigation of the growth of ice across the surface of a pool of water subcooled by the continuous evaporation of water from the surface. The use of light transmission measurements to measure ice particle size and concentration is discussed. This technique is advantageous because it causes a minimum disturbance to the system studied, and the photocells provide an instantaneous record of the changes in particle size and concentration. The initial steps in establishing work on heat and mass transfer to small spheres in turbulent suspension are discussed. A proposed program for washing brine from ice crystals will be in two parts: experimental and theoretical. (Davison-IPA)

INVESTIGATION OF CALCIUM SULFATE PRECIPITATION,
Monsanto Research Corp., Everett, MA.
B. M. Fabuss, A. S. Borsanyi, and C. H. Lu.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-177 206, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 183, May 1966. 45 p, 17 fig, 8 tab, 3 ref. 14-01-0001-465.

Descriptors: *Chemical precipitation, *Calcium sulfate, *Solubility, *Laboratory tests, *Sealing, Fouling, Heat transfer, Equilibrium, Rates evaporation, Temperature, Laboratory equipment, Research and development, Separation techniques, Desalination, Desalination apparatus, Water treatment.

An investigation was undertaken to obtain basic information on the equilibria and rate processes controlling calcium sulfate precipitation which fouls heat transfer surfaces in many desalination processes. Constant volume heating and constant temperature evaporation experiments were conducted by precipitating calcium sulfate from distilled water. The laboratory equipment consisted of an autoclave, sampling filter system, condenser and receivers, and associated instrumentation. The concentration range in the volume heating experiments was 400 to 2000 ppm with an equilibrium temperature range of 90 to 155C. A temperature range of 80 to 180C with initial concentrations of 100 to 1020 ppm and an evaporation ratio of 2.3 to 4.1 were used in the constant temperature evaporation experiments. In both types of experiments a break point was observed in the conductivity versus temperature curve at constant concentration, or in the conductivity versus concentration curve at constant temperature. These break points occurred between the solubility curves of the hemihydrate and anhydrite modifications. Precipitation started after the break point; the concentration of the solution did not reach or exceed solubility values corresponding to the hemihydrate solubility curve. For the temperature range, 100 to 180C, the precipitation of calcium sulfate from distilled water was controlled by the solubility curve of anhydrite; precipitation with respect to anhydrite was slow process. DESIGN AND CONSTRUCTION OF A DESALINATION PILOT PLANT, (A REVERSE OSMOSIS PROCESS).
Aerojet-General Corp., Azusa, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 574, Price codes: A04 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 86, January 1964. 61 p, 19 fig, 2 append. 14-01-0001-296.

Descriptors: *Desalination, *Desalination processes, *Reverse osmosis, *Laboratory equipment, *Membranes, *Fabrication, Evaluation, Laboratory tests, Adhesives, Sodium chloride, Aqueous solutions, Corrosion, Desalination apparatus, Separation techniques, Water treatment, Water purification, Sea water, Brackish water, Pilot plants.

A 1000 gpd pilot plant was designed, fabricated, and assembled in an evaluation of the reverse osmosis process for desalination of brackish and sea water. Membrane fabrication techniques and equipment are described. Of the two techniques used to evaluate the membranes, the dye test was rejected on the basis of the equipment and time involved; a random sampling and testing of 10% of a day's membrane production has been used with good results. Feed water compositions of 0.5%, 1.5% and 3.5% sodium chloride were used in operating tests. In many tests operation was continuous for four days at constant operating conditions. A total of 1100 gallons of product containing less than 400 ppm dissolved solids was produced during one 24 hours test with a 0.5% sodium chloride solution. Preliminary attempts to reduce corrosion, which had become an operating problem, were partially successful. The design of the bench scale appratus followed the laboratory equipment as closely as possible, but included novel features not used in the laboratory. Several different designs for desalination cells and membrane configurations were fabricated and tested on this apparatus. The results of this work indicate that some of the concepts will yield a more economical cell design. (Davison-IPA)

FIRST ANNUAL REPORT: SALINE WATER DEMONSTRATION PLANT NO. 2, SAN DIEGO, CALIFORNIA.
Burns and Roe, Inc., Hempstead, NY.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-181 684, Price codes: A10 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 102, February 1964. 194 p, 48 fig, 20 tab, 7 append. 14-01-0001-233.

Descriptors: *Desalination, *Desalination plants, *Demonstration Plant No 2, *Flash distillation, *Desalination processes, *Costs, Capital costs, Operating costs, Water costs, Maintenance costs, Water quality, Separation techniques, Water treatment, Scaling, Corrosion, Vegetation effects, Marine plants, Tubes, Water purification, San Diego(California), Sea water.

Group 3A—Saline Water Conversion

A technical and operational evaluation of the flash distillation process as employed by Demonstration Plant No. 2 at San Diego, California is reported for the period March 1962 through June 1963. During the first year of operation, mechanical difficulties caused only the normal interruption expected in new plants. Plant downtime was principally caused by clogging of the intake screens, condenser tubes, and tube sheets by marine vegetation. Some success was achieved through modifications to the equipment, but stoppage due to clogging remains the critical problem. Raising the distillation temperature increased the plant production, and although less corrosion and scaling were found than expected at the higher temperatures, the length of time in service was too short for these observations to be significant. During the period 347,000,000 gallons of high quality fresh water containing 5 ppm of dissolved solids have been delivered to the city of San Diego. Demonstration plant capital, operating, and maintenance costs are tabulated, and theoretical costs for a normalized plant are discussed. Although the major problems of scaling and high temperature operation have been overcome, long-term corrosion rates for the various types of metal tubing have not been determined. The copper alloy and carbon steel tubes appear in good condition. It is concluded that large scale plants of this type are economically attractive. Schematic drawings of the plant are provided. SEPARATIONS PROCESSES,
Oak Ridge National Lab., TN.
J. S. Johnson, Jr., and K. A. Kraus.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-200 921, Price codes: A11 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 508, February 1970. 231 p, 90 fig, 22 tab, 481 ref. 14-01-0001-937.

Descriptors: *Desalination, *Desalination processes, *Filtration, *Reverse osmosis, *Membrane processes, Membranes, Boundary layers, Polarity, Ion exchange, Mass transport, Adsorption, Heat transfer, Separation techniques, Water treatment, Water purification, Desalination apparatus.

Work on transport through membranes and across phase boundaries, and on ion exchange is reported in the third volume of the second biennial report on the activities of the Water Research Program at Oak Ridge National Laboratory. Altogether 21 papers are presented covering the following areas: salt filtration by charged microporous solids; hyperfiltration (reverse osmosis); concentration polarization; boundary layer studies; detachable membranes; dynamically formed membranes; and ion exchange. Of the 14 articles published in the open literature, one, 'Review Article on Hyperfiltration' has appeared as a chapter in the book 'Principles of Desalination'. There are 290 references for this article. (Davison-IPA)

SECOND ANNUAL REPORT, BRACKISH WATER CONVERSION DEMONSTRATION PLANT NO. 4 ROSWELL, NEW MEXICO.
American Hydrotherm Corp., New York.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-193 147, Price codes: A09 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No. 170, May 1966. 184 p, 45 fig, 22 tab, 23 ref, 7 append. 14-01-001-322.

Descriptors: *Desalination, *Desalination plants, *Demonstration Plant No 4, *Forced circulation vapor compression distillation, Capital costs, Operating costs, Operation and maintenance, Evaporators, Distillation, Scaling, Ion exchange, Equipment, Brackish water, Roswell(New Mexico).

A technical evaluation of the maintenance and repair work done and the development work carried out at the Roswell vapor compression distillation plant, New Mexico, is reported for July 1, 1964 through June 30, 1965. The plant was in actual operation only 21.3% of the scheduled time and produced 53.5 million gallons, averaging 750,000 gpd. Repairs and maintenance were necessary on all equipment. The compressor and its motor accounted for 50% of the downtime; major reconstruction of the ion exchange system was required. Developmental work was carried out on the ion exchange system, the deaeration system, and the evaporator system. The evaporator system studies related to velocity distribution, concentration studies of blowdown and the concentration that should provide scale free operation (3:1); scale composition at 4:1 concentration; additives for scale prevention; and the flow rate of the circulating pumps. Demonstration plant capital and operating costs, and theoretical capital and operating costs for a normalized plant are presented in addition to monthly production and cost figures. It is concluded that the plant is capable of producing one million gallons/day; that it is capable of scale free operation at a concentration factor of 3 to 1; and that its ion exchange system is capable of working mostly with blowdown introducing only a small amount of purchased salt. (Davison-IPA)

A STUDY OF REVERSE OSMOSIS SYSTEMS FOR DESALINATION,
Syracuse Univ., NY.
W. N. Gill, C. Tien, and D. W. Zeh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-177 207, Price codes: A03 in paper copy, A01 in microfiche. OSW Research and Development Progress Report No 185, May 1966. 33 p, 10 fig, 2 tab, 7 ref. 14-01-0001-401.

Descriptors: *Desalination, *Desalination processes, *Reverse osmosis, Flow, Performance, Diffusion, Equations, Boundary layers, Pressure, Velocity, Separation techniques, Water treatment, Water purification.

Continuous constant pressure reverse osmosis two-dimensional flow systems are analyzed, so that system performance is predicted in terms of operating variables. Therefore, the solution of the nonlinear diffusion equation employs nonlinear boundary conditions, and a series solution, accounting for nonlinearities in both the diffusion equation and its boundary conditions, is developed. Only wedge type flows are considered for boundary layer flows with pressure gradient, and the analysis is applicable to fully developed flows and entrance region flows. Numerical results are generalized, and some specific data are reported for systems similar to those used in practice. (Davison-IPA)
W79-06583

DESIGN AND SPECIFICATION BID PACKAGE FOR A 2500 GPD EUTECTIC FREEZING PILOT PLANT.
Fluor Engineers and Constructors, Inc. Irvine, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-295 916, Price codes: A08 in paper copy, A01 in microfiche. Report, March 1979. 127 p, 3 drawings. OWRT C-80132-S(8518)(1). 14-34-0001-8518.

Descriptors: *Freezing process, Thermal process, *Desalination, Brine.

A technical specification bid package for a 2500 gallon per day (GPD) eutectic freeze pilot plant was prepared. The package includes process and mechanical flow diagrams and plot plan of the pilot plant, as well as general project information and specific design criteria for the plant. The eutectic freezing pilot plant is designed to desalinate a brine feedwater, by producing ice and salt. A brine solution is fed into the freezer tank from which heat removal is accomplished by direct contact evaporation of refrigerant, R-114. Solids, ice and dihydrate salt, and a eutectic solution of brine are produced. A hydrocyclone is used to separate the heavier salt from the ice. Solid salt is removed from the brine solution in a filter. Ice is removed from the brine solution in drain and wash columns. Ice from the top of the wash column is repulped with product water to form a slurry which is fed to the melter/condenser. The ice is melted to form product water and in turn the compressed R-114 vapors from the freezing tank are condensed. Because of process inefficiencies and heat leaks into the process, the quantity of ice produced is not sufficient to condense all the refrigerant vapors. Make-up refrigerant is provided with a packaged refrigeration unit.

FINAL REPORT TO OFFICE OF WATER RESEARCH AND TECHNOLOGY - CONTRACT NO. 14-34-0001-7513.
Membrane Systems, Inc., San Diego, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 046, Price codes: A04 in paper copy, A01 in microfiche. February 1979. 55 p, 10 fig, 8 tab. OWRT (7513)(1). 14-34-0001-7513(1).

Descriptors: *Low pressure membrane, *Composite membrane, Brackish water, Spiral wound elements, Desalination processes, Reverse osmsosis, Membranes processes.

In Phase I, low pressure, composite membrane was developed for the desalination of brackish waters. The membrane barrier layer was formed by the interfacial polycondensation of polyethyleneimine and isophthaloyl chloride on polysulfone porous support. The polysulfone porous support was cast on a non-woven polyester fabric. The membrane has a flux of 20-22 GFD and a rejection of 97% or better when operated on a feedwater at 250 PSIG containing 5,000 mg/l of sodium chloride at 75F. In Phase II, 6 spiral wound reverse osmosis elements with nominal dimensions of 2 inches in diameter and 12 inches in length were fabricated, tested and shipped to the Roswell Test Facility. In Phase III, 6 spiral wound reverse osmosis elements with nominal dimensions of 4 inches in diameter and 12 inches in length were fabricated, tested and shipped to the Roswell Test Facility.

POTENTIAL FOR AUGMENTING FLOW OF THE COLORADO RIVER BY VEGETATION MANAGEMENT,
Rocky Mountain Forest and Range Experiment Station, Tempe, AZ.
A. R. Hibbert.
In: Proceedings, 21st Annual Arizona Watershed Symposium, Nov. 1, 1977, Tucson, Arizona, Arizona Water Commission Report No. 10, p 16-21, (1977). 5 tab.

Descriptors: *Colorado River Basin, *Vegetation effects, *Flow augmentation, *Watershed management, *Water yield improvement, *Forest management, *Evapotranspiration control, Rainfall-runoff relationships, Snow management, Water conservation, Environmental effects, Evaporation control, Sublimation, Streamflow, Surface runoff, Clearcutting, Cost analysis, Streamflow forecasting.

Building on the acknowledged premise that streamflow in the Colorado River Basin will be insufficient to meet all future demands anticipated from rapid growth in the region and the requirements of energy development, this study seeks to set forth some theoretical watershed management practices that might reduce evaporative loss and thus increase water yield in the Basin. Water yield response to various treatment practices was determined for 11 vegetation types (excluding phreatophytes) on lands in all ownerships in both Upper and Lower Basins, occupying some 76 million acres, or one-half the total Basin. Results of such

rials indicate that one-half million acre-feet of xtra water could be obtained from the Upper Basin by committing up to 22% of each vegetation ype except aspen forest by 80-year rotation clear-ut harvest in patches; in the Lower Basin, more xtensive treatments would be required to generate quarter of a million acre-feet of extra water. Disregarded in these choices are knowledge of vailability of treatable acreage and economic feas-ility, whereas in actual practice economic factors ill strongly influence priorities of treatment, as ill the complex and difficult matter of public cceptance of water yield improvement theories. esults are reported of pilot scale studies on treat-g water for recycle in the chiller used in poultry ocessing. To ensure a sanitary product, the SDA requires a half gallon of water/bird in the iller system. A recycling system for maintaining uivalent water quality at reduced flow must be pable of removing solids and controlling micro-l population. For ultraviolet light, used to con-l the microbial population, to be effective suffi-nt solids must be removed to allow light trans-ssion. The removal methods studied include: (1) clonic desludgers, (2) vibrating screens, (3) flota-n cells, (4) centrifugal waste concentration, (5) ration with diatomaceous earth (DE) filter aid, d (6) activated carbon. Results showed that DE ration was most feasible and that it maintained cterial level equivalent to that in a comparable nrecycle system. New water requirements/bird reduced from 0.5 gallons to 0.2 gallons. Operat-costs for the DE filtration system using 30 lons of ice/minute are $79.06/day. Operating st of the chiller without recycle are $146.90/day. avison-IPA)

POWER TRANSMISSION FOR SELF-PRO-PELLED IRRIGATION SYSTEM,
Toro Co., San Marcos, CA. (Assignee).
E. J. Hunter, and R. E. Hunter.
U.S. Patent No. 4,133,344, 7 p, 7 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 978, no 2, p 474, January 9, 1979.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Irrigation practices, *Irrigation efficiency, Application equipment, Center pivot irrigation system, Transmission, Self-propelled equipment.

A self-propelled center pivot irrigation system has individual span units each one of which has at least one or more fluid conduits, and at least one or more power frames for propelling the span unit. Each power frame has at least one or more drive wheels, a drive motor, and transmission means connecting the drive motor to the drive wheels. The transmission has an input drive gear, intermediate planetary gear speed reduction means and an output shaft for connection between the drive motor output shaft and the power frame drive wheels to provide a low friction, speed reducing, torque increasing drive for the power frame drive wheels from the drive motor. (Sinha-OEIS)

IRRIGATION LINE MOVER,
Crown American Irrigation, Inc., Eugene, OR. (Assignee).
P. E. Batson.
U.S. Patent No. 4,134,422, 5 p, 6 fig, 10 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 3, p 845, January 16, 1979.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Irrigation efficiency, Irrigation practices, Pipes, Application equipment, Mechanical equipment, Line mover.

An improved irrigation line mover is disclosed in which a line mover carried an engine rotating an irrigation pipe supported by wheels keyed to the pipe. The engine also drives wheels of a cart-like carriage of the line mover through reversible one-way clutches. Each clutch includes a sprocket keyed to an axle keyed to cart wheels and a lever-like pawl held by a spring extending around the axle in either an only forward driving position relative to the sprocket or an only reverse driving position relative to the sprocket. (Sinha-OEIS)

LIQUID FLOW CONTROL DEVICE,
E. M. Bright.
U.S. Patent No. 4,134,550, 9 p, 9 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 978, No 3, p 891, January 16, 1979.

Descriptors: *Patents, *Irrigation, *Irrigation efficiency, *Irrigation practices, *Flow control, Application equipment, Valves, Water pressure, Drip irrigation, Emitters.

A low cost valve, such as an emitter for controlling the flow from an aperture in a drip irrigation pipe, operates dynamically to maintain flow substantially constant across a wide range of pressures. A cylindrical valve seat mounted within the pipe aperture receives a valve member having a coaxial stem portion that extends through the valve seat to couple an external cap member. The interior end of the valve member comprises a diverging cone defined by integral and circumferentially separated leaf elements that engage a bearing surface of the valve seat at a root circumference when unstressed. Increasing water pressure within the pipe acts against the interior of the cone surface, distorting the leaf elements inwardly a proportional amount and shifting the valve member relative to the bearing surface through a selected limited operating range. The effective apertures between the leaf elements increase in length but decrease in width with greater pressure, providing an increasing impedance that maintains flow rate constant. The leaf elements are of selected stiffness and of relatively low friction material, and assume a stable pressure responsive position whether pressure is increasing or decreasing. The apertures between the leaf members are further shaped to provide an automatic purging flow when the pressure increases to or above a selected maximum. (Sinha-OEIS)
W79-06636

EMITTER FOR DRIP IRRIGATION,
D. G. Zeman.
U.S. Patent No 4,134,551, 8 p, 7 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 978, No 3, p 891, January 16, 1979.

Descriptors: *Patents, *Irrigation, *Irrigation efficiency, Irrigation practices, Flow control, Application equipment, Tubes, Closed conduits, Drip irrigation, Emitters.

A desirable emitter for use in drip irrigation can be constructed so as to utilize an elongated member formed of a flexible, resilient material so as to include at least one and preferably a number of internal ribs or projections which prevent the interior of the member from being closed off or pinched shut as it is deformed or flexed. Such a member is normally mounted so as to extend into an enclosed space such as the interior of an irrigation tube or conduit in such a manner that water can flow from the interior to the exterior of the space through the member. The liquid within the space can be controlled so as to exert a force against the exterior of the emitter causing it to be deformed or flexed in such a manner as to vary the flow through the member. (Sinha-OEIS)

WATER BALANCE IN IRRIGATED SOILS,
Academia de Stiinte Agricole si Silvice, Bucharest (Romania).
M. Botzan, and O. Merculiev.
ICID Bulletin (International Commission on Irrigation and Drainage), Vol. 27, No. 2, p 23-29, 35, July, 1978. 26 ref.

Descriptors: *Water balance, Irrigation design, Irrigation programs, *Consumptive use, Soil-water-plant relationships, Leaching, Evapotranspiration.

The paper presented the results obtained by land experimental research works carried out in different pedoclimatic zones of Romania (temperate zone) between 1945-1947 and continuously since 1951. The water balance elements (initial reserve, final reserve, winter and summer precipitations, groundwater supply, soil water consumption on different calculated probabilities on crops and pedoclimatic zones, the water application and the irrigation rates during the vegetation and supply periods) were quantitatively characterized. Interrelationships of water consumption with the type of crop and pedoclimatic zone, soil humidity, air temperature, and crop yield were established. These correlations allowed for establishing an indirect water-consumption calculation method. For the irrigation project designing model, the basic elements and the limitative conditions were established. Both the irrigation as required and irrigation by rotation were analyzed for the water application forecast and programming. Also, the basic participating elements of the model in the prognosis stage were established together with the limitative conditions which determine the water application program in the row of plots irrigated in a single rotation. DESCRIBING IRRIGATION EFFICIENCY AND UNIFORMITY.
American Society of Civil Engineers, New York. Irrigation and Drainage Div.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 104, No IR1, p 35-41, March 1978. 3 fig, 6 equ, 11 ref.

Descriptors: *Irrigation efficiency, *Water distribution(Applied), *Surface irrigation, *Uniformity, Sprinkler irrigation, Trickle irrigation, Soil moisture, Equations, Mass balance, Infiltration, Depth.

To help standardize system design and evaluation terminology, a limited number of the more essential terms defining efficiency of water application and distribution by irrigation systems are presented. These definitions have been formulated to minimize conflict with common usage or existing glossaries. Where methods of evaluating the terms are not obvious, suggestions have been presented and the utility of the terms in irrigation system design or evaluation has been discussed. Application of the terms to some of the newly developing methods of irrigation has also been considered. (Bell-Graf--Cornell)

TRICKLE IRRIGATION UNIFORMITY AND EFFICIENCY,
Rain Bird Technical Services, Glendora, CA.
K. Solomon, and J. Keller.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 104, No IR3, p 293-306, September 1978. 5 fig, 1 tab, 16 equ, 8 ref.

Descriptors: *Irrigation efficiency, *Trickle irrigation, *Application methods, *Emission standards, *Uniformity, Design, Networks, Histograms, Flow rate, Manifolds, Equations, Pressure distribution, Effects, Sloping terrain.

Expressions are developed and presented for the pressure head available at any point within a trickle irrigation subunit. Histograms are drawn showing the distributions of pressure within typical subunits. Distributions of emitter flow rates within typical subunits are derived from considerations of the effects of pressure differentials and manufacturing variations in emitter characteristics. The coefficient of equations and distributions developed are used to complete tables giving the emission uniformity and efficiency of systems for various combinations of design and equipment characteristics. (Bell-Graf--Cornell)

LEACHING CONTROL CAN'T BE PERFECT,
R. Larsen.
Irrigation Age, Vol. 13, No. 2, p. 49, October, 1978. 1 fig.

Descriptors: *Leaching, Leachate, *Nitrogen, Nitrates, Irrigation, Scheduling, Nebraska.

This article reported the study to minimize losses from leaching conducted on sandy soils by some members of the Agricultural Engineering Department, University of Nebraska-Lincoln. The major conclusion of the study was that scheduling of irrigations to minimize percolation and proper selection of nitrogen (N) amount and source can have a significant effect on nitrate leaching loss when corn is produced on sandy soils. The study, however, indicated that reducing the loss to zero is not a practical goal on sandy soils. (Skogerboe-Colorado State)

MINIMIZING SALT IN DRAIN WATER BY IRRIGATION MANAGEMENT--DESIGN AND INITIAL RESULTS OF ARIZONA FIELD STUDIES,
Science and Education Administration, Riverside, CA. Salinity Lab.
G. J. Hoffman, C. Dirksen, R. D. Ingvalson, E. V. Maas, and J. D. Oster.
Agricultural Water Management, Vol. 1, No. 3, p 233-252, November, 1978. 11 fig, 3 tab, 19 ref.

Descriptors: Water management(Applied), *Salinity, *Drainage water, *Leaching, Return flow, Evapotranspiration, Oranges, Alfalfa, Arizona.

Two field experiments were established in the Wellton-Mohawk Irrigation and Drainage District of southwestern Arizona to test the feasibility of decreasing the salt load in drainage water by reduced leaching. Results were given for the initial 2 years of the test for Valencia orange trees and the first year for alfalfa. The water application data, substantiated by salinity sensor readings and measures of soil chloride, indicated that the annual evapotranspiration of Valencia orange was approximately 1375 mm on a total area basis. After 2 years, fruit yield and quality and tree growth were not significantly different from flood-irrigated trees that received 40% more water. It was concluded that if these results persist, the salt load from citrus in the district could be reduced 40,000 Mg annually by reduced leaching. More importantly, because of the salinity of the groundwater pumped for water table control the salt load exported from the district could be reduced initially by 130,000 Mg annually. Results indicate that the alfalfa experiment was underirrigated the first year and evapotranspiration was about 1950 mm annually. Comparisons indicated that the level basin flood irrigated check yielded 20% more than the experiment and had about 10% leaching, an efficiency that can probably not be improved. CHOICES IN IRRIGATION MANAGEMENT,
ICID Bulletin, (International Commission on Irrigation and Drainage). Vol. 27, No. 2, p 62-64, July, 1978.

Descriptors: Groundwater, *Irrigation programs, Pricing, Crop production.

A workshop on choices in irrigation management was organized by the Agricultural Administration Unit of the Overseas Development Institute and held at the University of Kent, Canterbury. The workshop was attended by 35 participants, of whom 12 came from eight different countries in Asia, Africa and Latin America. The majority of these had extensive first-hand experience of irrigation management at project level. Twenty-one papers were presented and discussed. This paper is a summary of these 21 papers discussed under several categories of irrigation management. (Skogerboe-Colorado State)

SOME PROPOSITIONS ABOUT IRRIGATION PROJECT AND SYSTEM MANAGEMENT,
Overseas Development Inst., London (England).
A. F. Bottrall.
ICID Bulletin, International Commission on Irrigation and Drainage. Vol. 27, No. 2, p 68-72, July, 1978. 1 tab.

Descriptors: *Irrigation programs, Agriculture, Decision making, Project planning, Crop production.

This is a modified version of a paper presented at the Overseas Development Institute Workshop on Choices in Irrigation Management, held from 27 September-1 October, 1976 at the University of Kent, Canterbury, (U.K.). The object of this paper is to put forward some generalized propositions about certain aspects of irrigation management in developing countries on which, whatever the characteristics of a particular project or system may be, strategic decisions will at some point have to be made. The propositions are concerned primarily with projects dependent on surface water delivery systems. The propositions are derived primarily from observations made during field research in North West India and from the desk review of case studies in other parts of the developing world. The first set of propositions is concerned with the broader aspects of project organization and management, the second set with more detailed aspects of water delivery system design and operations. But there is clearly a large degree of interdependence between propositions in each set. (Skogerboe-Colorado State)

WATER HARVESTING AGRISYSTEM TO GROW JOJOBA ON DEVELOPED IDLE FARMLAND,
Arizona Water Resource Research Center, Tucson; and Arizona Univ., Tucson. Office of Arid Lands Studies.
J. B. Cluff, and K. E. Foster.
Arizona Water Resources News Bulletin, No. 78-1, Jan.-April 1978. 3 fig, 2 tab.

Descriptors: *Water harvesting, *Rainfall-runoff relationships, *Water yield improvement, *Jojoba, Surface sealing, Arid climtes, Water conservation, Sodium Chloride, Weed control, Reservoir storage, Computer analysis, Root zone, Infiltration, Agricultural production, Crop response, Arizona.

Recognizing the present groundwater overdraft of most of Arizona's basins, the University of Arizona Water Resources Research Center in cooperation with the Dept. of Soils, Water and Engineering, has developed a water harvesting agrisystem to rehabilitate abandoned farmland, designed to operate without groundwater. For descriptive purposes the system is applied to jojoba as a cash crop on a 5-acre area in the Avra Valley, Arizona. Based upon a similar system at Page Ranch, north of Tucson, where a one-acre plot has been used for the past several years to grow grapes, the present project involves the reshaping of farmland into a large and runoff configuration which is treated with sodium chloride to increase runoff and reduce weed and dust control costs. Rainwater is expected to run from the ridged portion into adjacent drainages planted with jojoba, with excess runoff being collected and pumped to a compartmented reservoir for plant use as needed during peak-production low-precipitation periods. The system design parameters were tested by computer analysis based on 31 years of daily rainfall and runoff records for the test area. Three simulations were made using different root-depth and infiltration-width data. Results indicated that as jojoba plants grow, larger amounts of water can be stored in the soil and lesser amounts in the compartmented reservoir although the reservoir appears to be essential to maximize production. Estimated costs to establish and maintain one plantation acre of jojoba for the three years before bean yield are $1,638 per acre. (Hickes-Arizona)

REDUCING SALT PICKUP FROM IRRIGATED LANDS,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
W. R. Walker, G. V. Skogerboe, and R. G. Evans.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol. 105, No. IR1, p 1-14, March 1979. 5 fig, 16 ref.

Descriptors: *Irrigation efficiency, *Automation, Salinity, *Water quality control, *Optimization, Cost minimization, *Model studies, Colorado River, Desalination, Return flow, Seepage, Drainage, Furrow irrigation, Sprinkler irrigation, Trickle irrigation, Equations, Systems analysis, Agriculture, Treatment model, Canal linings, Cost effectiveness.

Reducing the contribution of irrigated agriculture to the problem of salt loading in a major river basin is described in both a conceptual and mathematical context. The array of alternative solutions is primarily structural in nature and are oriented towards reducing salt pickup resulting from inefficient irrigation practices. The optimization of salinity control strategies involves combining the best features of several control measures. Consequently, the analyses described are based on finding the minimum cost solution to a salinity control problem involving a specified goal for salt load reduction. The multilevel optimization method involves two models: (1) an agricultural model divided into a water conveyance subsystem and an on-farm subsystem; and (2) a treatment model. (Bell Graf-Cornell)

AIR CHAMBERS FOR IRRIGATION SYSTEMS,
Bookman and Edmonston, Glendale, CA.
G. E. Conant, and D. E. Jaspar.
Journal of the Transportation Engineering Journal, Proceedings of the American Society of Civil Engineers, Vol. 105, No. TE2, p 141-148, March 1979. 4 fig, 2 tab, 1 ref.

Descriptors: *Irrigation systems, *Air chambers, *California, *Droughts, *Water distribution(Applied), *Wells, *Water hammer, *Pipelines, Agriculture, Groundwater, Irrigation, Hydraulics, Hydrodynamics, Pumping.

The 1977 drought was the most severe in California's history. The California Water Project was able to deliver only about 30% of the water demands for the calendar year 1977. The Wheeler Ridge-Maricopa Water Storage District receives its water from the California Water Project and, therefore, the District was able to provide only 30% of the farmer's water needs in 1977. The District, in an effort to alleviate the effects of the drought, allowed private wells to be connected into the District's distribution system. The existing distribution systems were not designed to accommodate such connections and the resulting hydraulic pressures within the distribution system were of concern to the District. In view of the need for additional water, a simple conservative solution to the problem of analysis employs the techniques presented by Parmakian. Confirmation of the validity of the solutions is supported by field tests. (Bell Graf-Cornell)

RAIN WATER MANAGEMENT FOR LOWLAND RICE CULTIVATION IN INDIA,
Central Soil Salinity Research Inst., Karnal (India). Div. of Engineering.
V. V. D. Narayana.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineering, Vol. 105, No. IR1, Proceedings Paper 14430, p 87-98, March 1979. 12 fig, 7 tab, 9 ref, 1 append.

Descriptors: *Rainfall, *Storage, *Alkaline soils, Runoff, Hydrographs, Infiltration, Hydraulic conductivity, Ponds, Water resources, Crops, Rice, Precipitation(Atmospheric), On-site investigations, Water management(Applied), Agriculture, Hydrology, *India.

In India, only a small portion of the total rainfall is utilized for crop production; the rest runs off. Nearly 2,500,000 ha of alkali soils of the Indo-Gangetic region (characterized by flat topography and impermeable nature) remain unproductive due to surface water stagnation during the rainy season. The Central Soil Salinity Research Institute at Karnal, India, worked out design criteria and specifications for a three-tier system of rainwater management for these areas and hydrologically evaluated their performance. It was demonstrated that by adopting this rainwater management procedure, water use efficiencies were increased, drainage needs minimized, and groundwater recharge increased. (Sims-ISWS)

Aug. 4-7, 1976, Purdue Univ., IN. 35 p, 11 ref 3 fig, 1 tab. Water Resources Journal. OWRT B-076-PA (3), 14-0001-5108.

Descriptors: Planning, Computer models, *Storm runoff, Surface runoff, Urbanization, Floods, Urban drainage, Urban hydrology, Urban runoff, *Model studies.

Successful urban water resources management depends on the ability of urban planners and managers to predict accurately, in advance, the effects that increased urban development will have on stormwater runoff. The present inability to predict watershed response is a major factor leading to increased urban flooding, and a lowering of runoff quality due to the lack of proper control. The situations for which the use of the Penn State Urban Runoff Model is intended are less general than those of many current urban runoff models. The Penn State Urban Runoff Model was developed as an alternative to the traditional Rational Method and other semi-empirical procedures for urban drainage design. It deals entirely with the quantity of stormwater runoff, and does not directly consider urban runoff quality. The objectives adopted for the development of the Penn State Urban Runoff Model were: (1) to produce an urban runoff simulation model which would provide acceptable hydraulic accuracy while remaining at a level of sophistication compatible with minimum practice and data collection time, (2) to

keep the model as simple and concise as possible to insure its convenient use, (3) to allow for the analysis of the timing of subarea flow contributions to peak rates at various points in a watershed. (Sink-Penn State)

SIZING TAILWATER RECOVERY SYSTEMS TO UTILIZE RUNOFF FROM PRECIPITATION ON IRRIGATED LANDS,
Kansas State Univ., Manhattan. Dept. of Agricultural Engineering.
Mao Liang-Tsi.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-295 817, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis 1977, 88 p, 11 fig, 12 tab, 19 ref, 2 append. OWRT A-077-KAN (2).

Descriptors: Furrow irrigation, Storage volume, *Runoff, *Irrigated land, Precipitation, Tailwater.

Runoff from precipitation on furrow irrigated land is considered as an alternative source of irrigation water in Western Kansas. This helps to prolong the life of ground water supplies. A continuous watershed simulation model was used to estimate the amount of runoff generated from field-size furrow irrigated areas. The runoff was then routed through various sizes of tailwater recovery pits to determine the amounts of runoff utilized, based on continuous pumping systems. Pit size is the main factor affecting the percentage of runoff utilized. When the storage volume of the pit increases to 5 times the normal tailwater recovery pit size, about 70 percent of the runoff from precipitation was utilized. This is up to 10 percent of the total water used for irrigation. The quantity of ground water used decreases as the quantity of runoff utilized increases. Both of these terms can be expressed in a second-order polynomial equation. The sum of all the costs affected by the use of runoff from precipitation determines the optimum pit size. The factors which determine the optimum pit size are quantity of runoff availiable to be utilized, pumping lifts of well and pit, type of fuel used, and fuel price. If the fuel price and well pumping lift rise above a certain level, it might become economically feasible to construct a larger pit to utilize runoff from irrigated land.

HARVESTING RUNOFF FROM PRECIPITATION ON IRRIGATED LANDS,
Kansas Water Resources Research Inst., Manhattan.
H. L. Manges, and Liang-Tsi Mao.
Paper No. 78-2559, Presented at 1978 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 18-20, 1978. 15 p, 2 fig, 3 tab, 10 ref, ASAE, St. Joseph, Michigan. OWRT A-077-KAN(3).

Descriptors: Tailwater, *Irrigated land, *Runoff, Precipitation, Water balance, Pumping.

Runoff from precipitation on irrigated land is an alternate source of water for irrigation. Use of such water can extend the life of ground water presently stored in underground aquifers. A tailwater management model was developed to simulate runoff from furrow irrigated land. Runoff volume from precipitation was estimated and routed to various sizes of tailwater pits. A daily water balance was maintained for both the soil and the pit. The tailwater management model was tested for corn growing on two commonly irrigated soil types on a quarter section of land near Garden City, Kansas. Twenty five years of continuous records of climatological data were used to simulate performance of the system. The tailwater pit was sized to hold multiples of one day's pumping for irrigation. Average annual precipitation was 473 millimeters and runoff from precipitation was 69 and 39 millimeters for Soil Types 3 and 5, respectively. Runoff from precipitation pumped back onto the field varied from 26 percent when the pit held runoff from one day's irrigation to 70 percent for a pit 5 times as large. Runoff from precipitation pumped from the tailwater pit was 3 and 7 percent of total water pumped for Soil Type 3, and 2 and 4 percent for Soil Type 5, respectively, with the smaller percentage pumped from the smaller pit.

A DRAINAGE MODEL FOR A RECLAIMED SURFACE MINE,
Iowa State Univ., Ames. Dept. of Agronomy.
L. Prunty, and D. Kirkham.
Soil Science Society of America Journal, Vol. 43, No. 1, p 28-34, January-February 1979. 9 fig, 1 tab, 15 ref.

Descriptors: *Mathematical models, *Mine drainage, *Strip mines, *Land reclamation, Crops, Steady flow, Water table, Terracing, Dupuit-Forchheimer theory, Soil profiles, Drains, Depth, Groundwater recharge, Hydraulic conductivity, Model studies, Row crops, Bench terraces.

Strip mine reclamation for row-crop production employing bench-terraced geometry is under study and may become increasingly common. A simplified model of the postreclamation soil profile at the Iowa Coal Project Demonstration Mine No. 1 was created. The model was used to find the steady-state water-table shape if one tube drain per terrace is installed. Dupuit-Forchheimer (D.F.) theory was used for the anayses. Water-table curves were generated for a series of alternative drain-tube locations. An analysis was made to find the best position for the drain tube. It was found that, for a recharge-to-soil-conductivity ratio of 0.01 for terraces repeating at a 45.7-m interval, the best drain-tube location is beneath the horizontal portion of the terrace 4.87 m from the toe of the backslope if the drain tubes are placed 2.44 m beneath the surface of soil underlaid by a barrier at 3.05 m depth. The horizontal portion of the bench terraces is 38.08 m, and the vertical drop from one terrace to the next is 3.05 m. A table of best drain locations was given for other drain depths and recharge rates. Previous work on D.F. theory for a uniformly sloped barrier was discussed briefly and compared with and contrasted to the present work for a barrier that parallels the bench-terraced surface of the reclaimed surface mine. THE USE OF LANDSAT DCS AND IMAGERY IN RESERVOIR MANAGEMENT AND OPERATION,
Army Engineer District, Waltham, MA. New England Div.
S. Cooper.
Type II Progress Report No 6, September 1, 1976. 13 p, 5 fig, 1 tab. NASA 22510.

Descriptors: *Remote sensing, *Satellites(Artificial), *Snow cover, *Watersheds(Basins), Instrumentation, Equipment, Water resources, Reservoirs, Reservoir operation, Snowpacks, Computers, Computer programs, Projects, *LANDSAT.

New England Division's LANDSAT downlink has been fully implemented, and the tracking system operates unattended with near 100% reliability. Software has been developed with the intention of the recovery from various malfunctions. Power interruptions do not abort the data collection function entirely, but if a satellite pass is in progress when a power failure occurs, the remainder of data from the current pass will be lost; however, the computer will recoup by the next pass. The LANDSAT tracking system integrates a set of about 20 programs or subroutines, about 10 disc data files, and several pieces of equipment. Essentially, the system predicts the satellite position, tracks the satellite, stores the incoming data, returns to the predicting program, and continues cycling in that fashion. Initial analysis of the 4 MSS energy band computer printouts showed that the greatest contrast between the areas of snow on open spaces, such as rivers and fields, and forested areas occurred on MSS band 5 (0.6-0.7 micrometers). RUNOFF EVALUATION OF CATCHMENTS AT GRANITE REEF,
Science and Education Administration, Phoenix, AZ. Water Conservation Lab.
D. H. Fink, G. W. Frasier, and L. E. Myers.
In: Proceedings, 21st Annual Arizona Watershed Symposium, Nov. 1, 1977, Tucson Arizona, Arizona Water Commission Report No. 10, p 26-32 (1977), 8 fig, 2 tab, 8 ref.

Descriptors: *Water harvesting, *Rainfall-runoff relationships, *Runoff, *Water yield improvement, *Surface sealing, Water conservation, Surface-runoff, Water spreading, Infiltration, Soil compaction, Soil sealants, Soil treatment, Costs, Vegetation effects, Membrane processes, Regression analysis, Asphalt, Plastics, Synthetic rubber, Arizona.

Described is a water harvesting research program conducted by the U. S. Water Conservation Laboratory, Phoenix, AZ, carried out at the Granite Reef test facility near Mesa, AZ. Laboratory and limited field studies commenced in 1959 with the intention of establishing and developing the most promising water harvesting materials and treatments. To evaluate treatments at Granite Reef, measurement of runoff efficienties for individual storms for extended periods of time was undertaken using linear regressional analysis. Results indicated that asphalt-fiberglass treatments yield nearly as much runoff per year as membrane sheetings like butyl rubber and polyethylene, and will outlast butyl under Arizona conditions, while being considerably less expensive to install. Paraffin wax treatments yielded nearly as well as butyl, showed no signs of weathering after 5 years and were even less expensive to install than asphalt-fiberglass. Other treatments that were evaluated were standard roofing, concrete, silicone and devegetation, smoothing and compaction, all of which were found to be less efficient in varying degrees at increasing runoff. (Tickes-Arizona)

COUNTY DRAINAGE DITCHES IN SOUTH CENTRAL MINNESOTA: A UNIQUE RIPARIAN ECOSYSTEM,
Mankato State Univ., MN. Dept. of Biology.
H. W. Quade.
In: Strategies for Protection and Management of Floodplain Wetlands and Other Riparian Ecosystems, GTR-WO-12. Proceedings of the Symposium, Callaway Gardens, Georgia, December 11-13, 1978, p 400-410. 5 fig, 5 tab, 10 ref. A-040-MINN(1).

Descriptors: *Drainage, *Drainage area, *Drainage effects, *Drainage practices, *Drainage programs, *Drainage systems, Minnesota, Lake Tetonka, Le Sueur County, Agricultural runoff, Farm wastes, Agricultural chemicals, Environmental effects, Land reclamation, Land management, Water quality, Water pollution sources, Legal aspects, Permits, Mapping.

Research is reported for the purpose of generating input data which will eventually allow a model of the drainage system in South Central Minnesota to be made. The extent and reasons for drainage in this area are addressed, and the findings of a case study on the effects of a drainage ditch on lake nutrient loading are reviewed. The constitutionality of drainage within Minnesota is also discussed. According to a 1959 agricultural census Minnesota had drained 11.7 acres of land representing 11.5% of all drained agricultural land in the U. S. An extensive mapping program of the drainage in this area, initiated because existing data was not dependable, becomes important, because significant differences in the extent of drainage data would result in differences in water resource planning by county, State or Federal planners. Water quality samples taken at several locations revealed that the major loading of Lake Tetonka in Le Sueur County comes from the Cannon River upstream of the confluence of the river and County Ditch 59. The water chemistry from a variety of ditches is being investigated. It is concluded that construction and maintenance of drainage ditches should follow the broadly based, environmentally assessed guidelines, and that it is possible for Minnesota to

ıave both quality agriculture and water resources. (Davison-IPA)

OPTIMAL WEEKLY RELEASES FROM A SEASONAL RESERVOIR 1. DETERMINISTIC FUTURE,
Electro-Watt Engineering Service Ltd., Zurich (Switzerland).
F. Laufer, and H. J. Morel-Seytoux.
Water Resources Research, Vol. 15, No. 2, p 383-398, April 1979. 15 fig, 4 tab, 22 ref.

Descriptors: *Reservoir releases, *Reservoir operation, *Optimization, *Hydrology, *Power economics, *Decision theory, *Operations research, Equations, Drawdown, Constraints, Runoff, Rivers, Water policy, Reservoir storage, Algorithms, Seasonal, Weekly, Electrical energy, Kuhn-Tucker conditions, Refill, Alpine watersheds, Lagrange multipliers, Finite capacity, Emptiness, Benefit maximization.

A technique is presented to maximize the returns rom the operation of a seasonal alpine reservoir or the production of electrical energy. The emphasis rests on a comprehensive approach to the problem, and the following fields are considered: ydrology, power economics, operations research, nd decision theory. The solution technique to etermine the optimal releases strategy is first developed for the deterministic case. It is based on he solution of the system of equations given by the Kuhn-Tucker conditions. As the direct solution of his system of equations is complicated, an alternative approach has been devised. The operation eriod is divided into two parts: the drawdown hase and the refill phase. For each phase, the ptimality conditions are solved by a procedure kin to Masse's constrained calculus of variations, he physical constraints being first ignored, and hen introduced in a stepwise manner. A preliminary study of the approximate nature of the optinal releases sequence provides a good starting oint in the variational procedure and the number f iterations necessary to arrive at the optimum is educed to a minimum. The application of the eveloped technique to a seasonal reservoir fed by n alpine watershed shows that the method is both easible and attractive. It is also well suited for eneralization to the case of an uncertain future, to e presented in a second paper. (Bell Graf-Cornell)

A COMPARISON OF THREE FLOODING REGIMES, ATCHAFALAYA BASIN, LOUISIANA,
Coastal Environments, Inc., Baton Rouge, LA.
. L. van Beek, K. Wicker, and B. Small.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-293 157, Price codes: A05 in paper copy, A01 in microfiche. Final Report No. EPA-600/3-78-106, December 978. 90 p, 24 fig, 19 tab, 13 ref, 1 append. 68-01-299.

Descriptors: *Flood plains, *Regime, *Backwater, Regional development, *Planning, *Atchafalaya River Basin(Louisiana), Sediment discharge, Water evels, Rainfall, Fluctuations, Bayous, Flood control, River flow, Runoff, Watershed management, Bayou Fordoche, Buffalo Cove, Pat Bay.

A study of three backwater areas of the Atchafaaya Basin was undertaken to compare the hydrogic regime of sub-basins differing from each ther with respect to mode of flooding, stage variation, relative contribution of atchafalaya River vater and local runoff, and type of environment. Fordoche and Buffalo Cove located within the Atchafalaya Basin Floodway and subject to annual looding by the River, and Pat Bay located outside he floodway and in which flooding is controlled y local rainfall were selected for study. The comarison revealed the following as the most urgent eed for management of Atchafalaya Basin Floodvay units: (1) induction of low discharge flowthough to enhance water exchange in those areas urrently subject to a backwater regime and insufciently dewatered; (2) reduction of inflow associted with short term water level fluctuations during the annual rise of the River stages to reduce sediment introduction; (3) maximum utilization of the unit's surplus precipitation as a source of flood water to reduce inflow of Atchafalaya River water and sediments; and (4) the realization of these needs through water introduction at the upper end of the unit and simultaneous control over outflow at the lower end of the unit. (Davison-IPA)

4B. Groundwater Management

A PLANNING STUDY FOR IRRIGATION DEVELOPMENT IN WASHINGTON. VOLUME I, EXECUTIVE SUMMARY.
Washington State Univ., Pullman. Dept. of Agricultural Economics.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 550, Price codes: A03 in paper copy, A01 in microfiche. Prepared for Washington State House of Representatives, Olympia, October 1976. 48 p.

Descriptors: *Water resources, *Water rights, *Irrigation, *Water requirements, *Irrigation effects, *Washington, Water use, Water costs, Social costs, Marketing, Economic feasibility, Hydroelectricity, Energy, Columbia Basin Project, Equity, Public benefits.

This report summarizes the findings of an in-depth study of irrigation in Washington State. The report considers: (1) the employment and population changes induced by irrigation development; (2) employment and income effects of irrigation development; (3) energy and irrigation in Washington; (4) social overhead capital costs of irrigation development; (5) marketing of irrigation products; (6) economic potentials for producing and processing high valued cash crops from new irrigated lands in Washington; (7) economic feasibility of irrigation development; and)(8) water use fee. The opportunities and result in net migration into the area. Land owners, some farmers, food processors and the transportation industry are among those who benefit from irrigation development. Even the general public will benefit from improved aesthetics, more recreational opportunities, and lower food costs. But there are costs involved when building large-scale irrigation projects in Washington. Large-scale diversions create large losses of hydroelectric generating capability whose costs are borne by power consumers and social overhead costs paid by the general public in the form of higher state and local taxes, higher rates for utilities, and higher costs for services such as waste disposal. The analysis of irrigation feasibility shows that little or no profit can be expected from irrigation development in the state at this time. The report concludes that the evidence points in favor of a water use fee, which would offset the cost of transferring water resources belonging to all to individuals for their private use. (Coan-NC)

HYDROLOGIC IMPACTS OF SILVICULTURAL ACTIVITIES,
Rocky Mountain Forest and Range Experiment Station, Fort Collins, CO.
C. A. Troendle.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol. 105, No. IR1, Proceedings Paper 14437, p 57-70, March 1979. 9 fig, 4 tab, 6 ref, 1 append.

Descriptors: *Forestry, *Forest management, *Forest watersheds, *Water pollution sources, Water pollution, Forests, Trees, Model studies, Mathematical models, Precipitation(Atmospheric), Runoff, Evapotranspiration, Streamflow, Watersheds(Basins), Mountains, Soil moisture, Hydrology

Most pollution associated with silvicultural activities has a nonpoint source and is difficult to control by conventional methods. Process-oriented techniques were developed to allow the planner, engineer, or hydrologist to evaluate the impact that any proposed silvicultural activity will have on the hydrology of the planning unit. Changes in the

hydrologic processes stimulate changes in non-point source pollution. As a part of the effort to quantify hydrologic impacts, the country was broken into 5 hydrologic regions. Hydrologic models were fitted to representative baseline watersheds in each region. Process stimulation was then used to develop response coefficients to be used to modify the regional baseline levels of evapotranspiration (ET), soil water, and streamflow as a function of cover, soil depth, aspect, latitude, and position in the watershed. This presentation summarized the results of the efforts and presented an evaluation of the usefulness of the methodology. (Sims-ISWS)

4D. Watershed Protection

EFFECT OF CHISEL VERSUS MOLDBOARD FLOWING ON SOIL EROSION BY WATER,
Science and Education Administration, Lafayette, IN. Soil, Water and Air Sciences.
C. B. Johnson, and W. C. Moldenhauer.
Soil Science Society of America Journal, Vol. 43, No. 1, p 177-179, January-February 1979. 3 tab, 3 ref.

Descriptors: *Soil erosion, *Erosion control, *Farm management, Erosion, Simulated rainfall, Runoff, Infiltration, Farms, Crops, Soils, Soil science, Agriculture, Plowing, Plowing practices, Moldboard plowing, Chisel plowing, Residues.

An experiment was conducted using simulated rainfall on a field that was chisel plowed annually for 13 years before the experiment to compare erosion from this condition with moldboard plowing in the same field. One treatment was fall moldboard plowed, a second fall chiselled with some residue left on the surface, and a third was untilled in the fall with all residue removed in the spring. All 3 treatments were disked lightly in the spring. After the initial experiment was completed, residue was added so that all treatments had about 20% surface cover. During the initial rain application with no residue added, soil losses from the third treatment without surface residue were the same as those from the chisel plowed and disked surface with some surface residue. Both these treatments had only 23% of the soil loss of the moldboard plowed and disked treatment. During succeeding simulated rainfall under wet and very wet soil conditions, soil loss from the disked only treatment was up to 80% of that for the moldboard-plowed treatment. When residue was added to all treatments, soil loss from the chisel-plowed treatment was less than one-half that from the moldboard-plowed treatment. (Sims-ISWS)

NEW APPROACHES TO THE PRESERVATION OF CONTAMINANTS IN WATER SAMPLES,
Syracuse Research Corp., NY. Center for Chemical Hazard Assessment.
J. Saxena, and E. Nies.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-293 013, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/4-79-007, 1979. 58 p, 11 fig, 6 tab, 61 ref.

Descriptors: *Preservation, *Sampling, *Nutrients, *Biochemical oxygen demand, *Oil, Microorganisms, Phosphorus, Nitrogen, Hydrogen ion concentration, Freshwater, *Stabilization.

The use of antibiotics, chemical biocides, and lytic enzymes to preserve nitrogen and phosphorus series of nutrients, biological oxygen demand, and oil and grease in water and wastewater samples, was investigated. Sample preservation was evaluated based on ability to inhibit cell growth and oxygen utilization in primary and secondary effluents and natural water samples. Drugs which exhibited potential were: chlorohexidine, vantocil IB, polymyxin B + neomycin + streptomycin (PNS), erythromycin + polymyxin B + neomycin (EPN), erythromycin + polymyxin B + streptomycin (EPS), polymyxin B + chloramphernical + neomycin (PCN) and gentamycin + amikacin + polymyxin B (GAP). For primary effluents, the effective concentration range was 100 - 200 micrograms/ml. Effective concentrations were 50 - 100 micrograms/ml for secondary effluents and 10 - 50 micrograms/ml for fresh waters. Chlorhexidine and vantocil IB stabilized nitrate and nitrite in fresh water and relatively clean secondary effluent. The antimicrobial agents did not offer a practical solution to the preservation of BOD in waste waters. Oil and grease levels were stabilized by GAP and PCN for up to two weeks in fresh water. Chlorhexidine and vantocil IB effectively stabilized pH and dissolved oxygen in natural water samples only. (Small-FIRL)

FACTORS IN THE DETERMINATION OF SELECTED TRACE ELEMENTS IN NEAR-SHORE U.S. WATERS OF LAKES SUPERIOR AND HURON,
Environmental Research Lab., Duluth, MN.
J. E. Poldoski, E. N. Leonard, J. T. Fiandt, L. E. Anderson, and G. F. Olson.
Journal of Great Lakes Research, Vol 4, No 2, p 206-215, June 1978. 10 tab, 29 ref.

Descriptors: *Trace elements, *Lake Superior, *Lake Huron, *Great Lakes, Sampling, Chemicals, Chemical analysis, Chromium, Copper, Iron, Manganese, Nickel, Lead, Mercury, Lakes, Surveys, On-site investigations, Water pollution, Pollutants, Pollutant identification, Arsenic, Near-shore waters.

Determinations of total As, Cr, Cu, Fe, Mn, and Pb in acidified unfiltered water samples from 48 stations representing the nearshore waters of Lake Superior, Lake Huron, and selected incoming streams gave overall mean concentrations and standard deviations (microgram/L) of 1.0 + or - 0.7, 0.9 + or - 1.8, 2.0 + or - 1.8, 236 + or - 819, 14 + or - 34, and 0.7 + or - 0.8, respectively, using flameless atomic absorption analytical methods. Total concentrations of Ni and Hg were usually less than the instrumental detection limits (microgram/L) of 0.8 and 0.02, respectively. Small losses of Hg, As, and Cr from solutions are possible in addition to a molecular spectral interference in the determination of As using the graphite furnace method. River waters usually were only slightly higher in total element concentrations than lake waters, except for Fe and Mn. Nearshore waters of both lakes were very similar in elemental composition. (Sims-ISWS)

IDENTIFICATION OF CONTAMINANTS IN LAKE SUPERIOR THROUGH LANDSAT I DATA,
Minnesota Univ.-Duluth. Dept. of Physics.
M. Sydor, K. R. Stortz, and W. R. Swain.
Journal of Great Lakes Research, Vol. 4, No. 2, p 142-148, June 1978. 7 fig, 2 tab, 14 ref. NASA NGL-24-005263, EPA R005286011.

Descriptors: *Remote sensing, *Great Lakes, *Pollutants, *Lake Superior, Satellites(Artificial), Turbidity, Suspended solids, Clays, Mine wastes, Erosion, Sediments, Particle size, Rivers, Lakes, Runoff, Pollutant identification, Water pollution, Water pollution sources, Limnology, LANDSAT.

Remote sensing signatures were developed for using LANDSAT data in identification of 4 types of particulate contaminants in Lake Superior. The criteria were based on the residual LANDSAT signal intensities and signal ratios. The signatures worked well in differentiation of river runoff from high background turbidity due to erosion and resuspension. The threshold concentrations for identification of suspended solids in lakes ranged on the order of 1 mg/L for clear lakes such as Lake Superior and 5 mg/L for light absorbing water characteristic of the Duluth-Superior Harbor. EFFECTS OF SEWAGE SLUDGE ON THE BENTHIC INVERTEBRATE COMMUNITY OF THE INSHORE NEW YORK BIGHT,
Brooklyn Coll., NY. Dept. of Biology.
M. L. Botton.
Estuarine and Coastal Marine Science, Vol. 8, No. 2, p 169-180, February 1979. 2 fig, 6 tab, 24 ref.

Descriptors: *Sewage sludge, *New York, *Sludge disposal, *Marine animals, *Invertebrates, *Atlantic Ocean, Marine biology, Water pollution, Water quality, Surveys, Sampling, Sediments, Benthos, Benthic fauna, Biology, *New York Bight.

Benthic invertebrate community structure, including species diversity, biomass, and trophic structure, was examined at a sewage sludge disposal site and nearby 'control' site in the inner New York Bight off New York City. Although both sites are characterized by soft bottoms, have high organic carbon, and support similar deposit feeding assemblages, species diversity is lower at the sludge site, reflecting decreased species richness and evenness. Likewise, total biomass, as well as the proportional distribution of biomass among trophic groups, differed between sites. A previously suggested indicator species, Capitella capitata, is present in greater numbers at the control station than the sludge station. It is, therefore, unsuitable as an indicator species of pollution tolerance in the portion of the New York Bight examined in this study. A small polychaete belonging to the family Ampharetidae, Amage auricula, is by far the most abundant animal at the sludge disposal site, but its potential use as an indicator species is complicated by the fact that it exhibits a great tendency for aggregation. Ampeliscid amphipods appear sensitive to the presence of sludge and may be useful as indicators of contamination. Most of the common animals at both stations were aggregated, and it was recommended

hat future sampling in the area should be by the se of a larger number of small grabs such as the Shipek, rather than a smaller number of large grabs, as this will increase the probability that patchy fauna are encountered. (Sims-ISWS)

BIOTIC MONITORING,
Environmental Research Lab. Duluth, MN.
D. I. Mount.
In: Biological Monitoring of Water and Effluent Quality, ASTM STP 607, J. Cairns, Jr., K. L. Dickson and G. F. Westlake, Eds., American Society for Testing and Materials, 1977, p. 20-23.

Descriptors: *Bioassays, *Monitoring, *Pollution abatement, *Standards, *Industrial wastes, *Water Quality Control, Research and Development, Environmental effects, Water quality, Mortality, Toxicity, Water Quality Standards, Methodology, Sublethal effects, Prediction.

Past water pollution regulatory actions have dealt largely with eliminating existing unacceptable conditions from surface waters. Since the beginning of this decade, increased attention has been focused on preventing such conditions from developing. The shift has changed the informational need from one of assessing field conditions to one of predicting effects before they occur. A concomitant increased need for bioassays as predictive tools has occurred. Furthermore, analytical methods have not been developed to measure biologically active forms, and often they are not sensitive enough to measure concentrations at this 'no effect' level. In addition, the composition of wastes from today's industrial society are complex and variable and often contain many unidentified components. Therefore, aquatic bioassays are an essential tool for today's problems of aquatic environmental regulation. (Katz)

SOME MONITORING AND ANALYTICAL TECHNIQUES FOR THE STUDY OF LOCOMOTOR RESPONSES OF FISH TO ENVIRONMENTAL VARIABLES,
Texas A and M Univ., College Station. Dept. of Biology.
H. Kleerekoper.
In: Biological Monitoring of Water and Effluent Quality, ASTM STP 607, J. Cairns, Jr., K. L. Dickson and G. F. Westlake, Eds., American Society for Testing and Materials, 1977, p 110-120. 4 fig., 15 ref.

Descriptors: *Fish behavior, *Environmental effects, *Monitoring, *Water pollution effects, Analytical techniques, Equipment, Movement, Water temperature, Aquatic environment, Fish, Electronic equipment, Instrumentation, Methodology, *Sublethal effects, Responses, Locomotion, Avoidance.

The adaptive significance of locomotor, specifically orientation responses in fishes to environmental stimuli, is emphasized. General locomotor behavior is usually extremely variable over time whereas the responses mentioned are, most frequently, very subtle. Techniques are described to detect and quantify these responses by comparing locomotion before stimulation with that during exposure to the environmental variable(s) under study. Models for such comparisons are based on time series analysis of relevant locomotor variables, such as frequency and size of turns length and orientation of steps, velocity, and others. Two techniques for data acquisition of these variables, by means of monitoring locomotion thru electronics under controlled physical and chemical conditions, are described in some detail. Attention is called to the possible interaction of environmental conditions and the behavioral responses of fish, an aspect which, hitherto, has received too little consideration in studies on biological effects of environmental variables. (Katz).

SOME METHODS FOR HYPOTHESIS TESTING AND ANALYSIS WITH BIOLOGICAL MONITORING DATA,
Manitoba Univ., Winnipeg. Dept. of Zoology.
R. H. Green.
In: Biological Monitoring of Water and Effluent Quality, ASTM STP 607, J. Cairns Jr, K. L. Dickson and G. F. Westlake, Eds, American Society for Testing and Materials, 1977, p 200-211, 3 tab, 6 fig, 4 ref.

Descriptors: *Analytical techniques, *Distribution patterns, *Environmental effects, *Water pollution effects, *Mathematical studies, *Model studies, Spatial distribution, Temporal distribution, Monitoring, Benthos, Salts, Biological communities, Regression analysis, Methodology.

Procedures which are commonly used for determining the specific effect of an environmental change on a biological community are discussed and illustrated using a set of artificial data. Ninety-two stations on a kilometre grid are sampled for abundance of six benthic species and four environmental variables before and after an increased inflow of dissolved salts. A multiple regression model which assumes that species abundances are related to environmental variables in a linear additive manner yields inefficient and misleading results. Cluster analysis methods efficiently describe natural spatial patterns, but temporal changes are not detected. A linear additive model which relates changes in species abundances to changes in environmental variables removes the variation due to spatial pattern from the analysis and shows that biological changes related to increased salt concentrations have occurred. Methods for describing the changes and testing related hypotheses are presented. (Katz)
W79-06718

TIME AS A FACTOR IN BIOMONITORING ESTUARINE SYSTEMS WITH REFERENCE TO BENTHIC MACROPHYTES AND EPIBENTHIC FISHES AND INVERTEBRATES,
Florida State Univ., Tallahassee. Dept. of Biological Science.
R. J. Livingston.
In: Biological Monitoring of Water and Effluent Quality, ASTM STP 607, J. Cairns, Jr., K. L. Dickson and G. F. Westlake, Eds, American Society for Testing and Materials, 1977, p 212-234, 3 tab, 9 fig, 52 ref.

Descriptors: *Monitoring, *Seasonal, *Diurnal, *Temporal distribution, Analytical techniques, Estuaries, *Water pollution effects, Biorhythms, Benthic fauna, Invertebrates, Statistical methods, Sampling, Fish, Water quality, Oxygen, Salinity, Fishkill, Biomonitoring, Diversity, *Apalachicola Bay(Florida).

Biological monitoring programs of estuarine communities is complicated by the highly unstable physical environment and variations in temporal relationships due to diurnal, tidal, seasonal and annual periodicities. Implications of temporal variation of the natural environment are discussed relative to the biological sampling necessary to account for the variability; examples are taken from studies in three bay systems along the Gulf Coast of north Florida. Causative elements of the impact of pollutants should be viewed in terms of diurnal and seasonal variations. Against this background the timing of pollutant entry into the system could control the nature of the impact. Community structure can be masked or distorted by inadequate sampling either on a short-term or seasonal basis. This, together with seasonally directed changes in the actual impact of a given pollutant, should be taken into consideration in the design of a biomonitoring program. (Katz)

A LASER-BASED OPTICAL FILTERING SYSTEM TO ANALYZE SAMPLES OF DIATOM COMMUNITIES,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
K. L. Dickson, J. P. Slocomb, J. Cairns, Jr., and S. P. Almeida.
In: Biological Monitoring of Water and Effluent Quality, ASTM STP 607, J. Cairns, Jr., K. L. Dickson and G. F. Westlake, Eds., American Society for Testing and Materials, 1977, p 121-132. 8 fig, 7 ref.

Descriptors: *Monitoring, *Diatoms, *Water quality control, *Biological communities, *Instrumentation, Phytoplankton, Optical properties, Water pollution effects, Water quality, Research and development, Design, Analytical techniques, Microorganisms, Optical filtering system.

This paper describes a biomonitoring system currently being developed that employs coherent optical spatial filtering techniques to rapidly identify diatoms and process species-abundance information. Preliminary results indicate that the optical problems associated with such a system can be overcome, although investigations are continuing into the problem of interfacing a microscope directly to the optical system. This system could eventually be employed in a management program along with chemical and physical data to obtain full beneficial use of the ecosystem without damage. (Katz)
W79-06720

EVALUATION OF AN AUTOMATED BIOLOGICAL MONITORING SYSTEM AT AN INDUSTRIAL SITE,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
G. F. Westlake, and W. H. van der Schalie.
In: Biological Monitoring of Water and Effluent Quality, ASTM STP 607, J. Cairns, Jr., K. L. Dickson and G. F. Westlake, Eds., American Society for Testing and Materials, 1977, p. 30-37, 5 fig, 12 ref.

Descriptors: *Monitoring, *Bioindicators, *Technology, *Design, *Equipment, *Respiration, *Fish physiology, *Water quality control, *Industrial wastes, *Toxicity, Water quality, Pollutant identification, Pollution abatement, *Lepomis, *Biomonitor.

The feasibility of using biological monitoring of industrial point sources as a tool for river management has been demonstrated by a number of laboratory simulations. However, it is another task entirely to move these techniques to an industrial setting. The necessary modifications of a computerized biological monitoring system to install it in the Celanese Corporation Plant on the New River in Virginia are described. The system employs the respiration rates of bluegills (Lepomis macrochirus) as an indicator of abnormal variations in the effluent. (Katz)

MONITORING PROGRAM NEEDED FOR WISE TREATMENT CHOICES,
Beak Consultants Ltd., Vancouver (British Columbia).
K. Schiefer, and D. Lush.
Canadian Pulp and Paper Industry, Vol. 28, No. 5, p 34-35, 42-43, 46, May, 1975. 5 fig.

Descriptors: *Pulp and paper industry, *Waste water(Pollution), *Water pollution effects, *Environmental effects, *Surveys, Wastes, Industrial wastes, Water pollution sources, Toxicity, Biological properties, Water properties, Suspended solids, Dissolved solids, Dissolved oxygen, Biochemical oxygen demand, Hydrogen ion concentration, Toxins, Aquatic life, Water pollution.

The principal objective of an environmental monitoring program is to define the effects of discharged wastes on various environmental parameters before significant or irreversible damage is done. Three main components of a comprehensive monitoring program for the pulp and paper industry (i.e., chemical, toxicological, and biological analyses) are discussed. Chemical studies quantify the parameters (e.g., suspended solids, total dissolved solids, dissolved oxygen, BOD, pH, and concentrations of specific toxicants) of the receiv-

ing stream, while toxicological studies determine the effects of a specific effluent on life forms. Biological studies (examination of the aquatic community present in the receiving waters) provide an accurate assessment of the quality of the environment and evidence of any effect on the community which may be due to a mill effluent. A hypothetical monitoring program indicating the type of sampling array and typical parameters being measured is illustrated. (Sykes-IPC)

DETERMINATION OF ACETONE AND METHYL ETHYL KETONE IN WATER,
Geological Survey, NSTL Station, MS. Water Resources Div.
D. Y. Tai.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 151, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 78-123, October 1978. 36 p, 9 fig, 6 tab, 13 ref.

Descriptors: *Water analysis, *Organic compounds; *Analytical techniques, *Gas chromatography, Solvents, Water pollution, *Acetone, *Methyl ethyl ketone, Headspace analysis.

Analytical procedures for the determination of acetone and methyl ethyl ketone in water samples were developed. Concentrations in the milligram-per-liter range were determined by injecting an aqueous sample into the analysis system through an injection port, trapping the organics on Tenax-GC at room temperature, and thermally desorbing the organics into a gas chromatograph with a flame ionization detector for analysis. Concentrations in the microgram-per-liter range were determined by sweeping the headspace vapors over a water sample at 50C, trapping on Tenax-GC, and thermally desorbing the organics into the gas chromatograph. The precision for two operators of the milligram-per-liter concentration procedure, expressed as the coefficient of variation, was generally less than 2 percent for concentrations ranging from 16 to 160 milligrams per liter. The precision from two operators of the microgram-per-liter concentration procedure was between 2 and 4 percent for concentrations of 20 and 60 micrograms per liter. (Woodard-USGS)
W79-06812

AN APPROACH TO THE CLASSIFICATION OF UTAH MINE SPOILS AND TAILINGS BASED ON SURFACE HYDROLOGY AND EROSION,
Utah State Univ., Logan. Watershed Science Unit.
T. A. Burton, G. F. Gifford, and G. E. Hart.
Environmental Geology, Vol. 2, No. 5, p 269-278, 1978. 6 fig, 5 tab, 9 ref.

Descriptors: *Mine wastes, *Waste disposal, *Vegetation establishment, *Revegetation, *Mining, Coal mine wastes, Strip mine wastes, Mine water, Land subsistence, Spoil banks, Hydrology, Erosion, Overburden, Sediments, Land reclamation, Soil texture, Bulk density, Disposal, Compaction, Mulching, Statistical methods, Utah, Pollutants.

The present study classifies 35 mining deposits according to surface hydrologic and erosion characteristics within 24 Utah mining locations, 26 of which involves analysis of spoils or mined overburden wastes, 7 analysis of tailings, and 2 of ash deposits. Classification was achieved through cluster analysis to discover the inherent structure in the data and to evaluate similarities for the purpose of rating surface hydrologic limitations to revegetation. Results indicated that physical similarities among mine spoils may be strongly influenced by the geologic source of the spoils where overburden is produced from areas of simple geologic structure. Textures and bulk densities, on the other hand, are influenced by methods of handling during mining and disposal operations. Where these influences are the same in more than one site, surface hydrology and erosion parameters are often similar although a specific tailing deposit may be highly variable with respect to the physical and chemical characteristics produced by ore treatment and concentration. Suggestions for improved future rehabilitation with respect to the hydrologic characteristics of spoil deposits are: (1) conducting mining activities to permit identification and segretation of favorable overburden strata, (2) reconstituting soil for optimum plant growth, (3) shaping soils to be compatible with surrounding topography, (4) mulching with organic materials, and (5) avoiding compaction of the soil-spoil surface. (Tickes-Arizona)

SOURCE ASSESSMENT: TEXTILE PLANT WASTEWATER TOXICS STUDY -- PHASE I,
Monsanto Research Corp., Dayton, OH.
G. D. Rawlings.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 959, Price codes: A08 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-004h, March 1978. 169 p, 22 fig, 48 tab, 13 ref, 6 append. 68-02-1874.

Descriptors: *Water pollution sources, *Pollutant identification, *Industrial wastes, *Water pollution treatment, *Evaluation, *Toxicity, *Effluents, *Textiles, Sewage treatment, Sampling, Bioassay, Chemical analysis, Nutrients, Data collections.

Sampling, chemical analysis and bioassay procedures described are used to establish a baseline data base concerning toxicity and level of priority pollutants present in raw waste water and secondary effluents at 23 U.S. textile plants. Samples were analyzed for 129 consent decree priority pollutants, effluent guidelines criteria pollutants and nutrients; Level 1 chemical analyses were performed. Secondary effluent samples were submitted for the following bioassays: mutagenicity, cytotoxicity, clonal assay, freshwater ecology series, marine ecology series, 14-day rat acute toxicity, and soil microcosm. Bioassay results showed that 10 of the 23 plants have secondary effluents sufficiently toxic to proceed to a second phase of study wherein samples will be collected from the 10 plants to determine the level of toxicity removal attained by selected tertiary treatments. The plants are ranked according to relative secondary effluent toxicity. Modifications and recommendations for improvements to the sampling, chemical analysis, and bioassay protocols are discussed. QUANTITATIVE TECHNIQUES FOR THE ASSESSMENT OF LAKE QUALITY,
Michigan State Univ., East Lansing. Dept. of Resource Development.
K. H. Reckhow.
Prepared for: Land Resource Programs Division, Inland Lake Management Unit and the Water Quality Division, Michigan Department of Natural Resources, Lansing, Michigan, September 1978. 138 p, 22 fig, 22 tab, 49 ref, 2 append.

Descriptors: *Lakes, *Management, *Water quality, *Assessment, *Eutrophication, *Phosphorus, *Quantitative methods, Model studies, Equations, Systems analysis, Sampling, Design, Data analysis, Lake classification.

The development of lake management policy calls for the determination of likely causal relationships among the lake and lake basin characteristics. This manual focuses on the role of phosphorus in lake eutrophication. Discussed is the importance of personal judgment of experienced managers in the design of a data gathering program and in the interpretation of the data and a model's prediction. On the whole, the manual outlines quantitative techniques that can be used to evaluate strategies for lake management. Chapter 2 presents a number of commonly employed statistical techniques for the design of sampling programs and for data analysis. Chapter 3 discusses the simple empirical models for phosphorus, and Chapter 4 outlines several schemes proposed for lake classification. Examples are presented to illustrate the use of the techniques described in those chapters. In conclusion, Chapter 5 briefly suggests additional research that may lead to refinements of the techniques presented herein. (Bell Graf-Cornell)

INDUSTRIAL PROCESS PROFILES FOR ENVIRONMENTAL USE: CHAPTER 2. OIL AND GAS PRODUCTION INDUSTRY,
Radian Corp., Austin, TX.
G. E. Wilkins.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 639, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-77-023b, 1977. 130 p, 3 fig, 14 tab, 90 ref, 4 append.

Descriptors: *Oil industry, *Natural gas, *Effluent streams, *Waste water, *Pollutant identification, Water pollution sources, *Oily water, Brines, Sulfides, Air pollution, Industrial wastes.

The operations, processes, and effluent streams associated with the oil and gas production industry are characterized. Segments of the industry reviewed include: exploration and site preparation, drilling, crude processing, natural gas processing, and secondary and teritary recovery. Two process flow sheets and twenty process descriptions were developed to characterize operations. Input materials, operating parameters, utility requirements, and waste streams are reported for each process. The major waste streams resulting from oil and gas production contain hydrocarbons, oily brine, sulfides, sulfur compounds, and glycols. A large effluent stream is generated as a by-product of oil and gas production as an oily brine. Glycol-contaminated waste water is generated in natural gas processing. Offshore operations present a potential source of pollution when storms or shipping accidents cause uncontrollable well flows. Secondary recovery and drilling operations pose a potential contamination of aquifer zones by drilling fluids, brines, or hydrocarbons. Company and product information and related data are included. n: Proceedings, Eleventh Annual Offshore Techology Conference, Houston, TX, April 30-May 3, 979. Volume 1, p 355-363, 13 fig, 6 ref, Oct No 398. Offshore Technology Conference, Dallas TX. 1979.

Descriptors: *Hazards, *Resources development, *California, Leases, Oil pollution, Water pollution sources, Geology, Exploration, Sites, Baseline studies, *Outer Continental Shelf, Petroleum development, Souther California, Geotechnical conditions.

Potential hazards and engineering constraints identified in proposed Outer Continental Shelf (OCS) Lease Sale Area No. 48, offshore southern California, include water deeper than 1000 ft, seafloor slopes of 4 to 70%, submarine canyons and channels, assorted mass movement phenomena, faults, possible accumulations of gas in the shallow sediments, and locally hard and irregular seafloor. These features and conditions were identified in a reconnaissance, multi-sensor high resolution seismic survey. Prior to developmental activities, detail site specific studies will be necessary to determine the potential influence of geologic features and conditions. Safe and environmentally acceptable exploration and development of possible petroleum resources appears feasible, provided the geologic and geotechnical conditions within the area are fully recognized and appropriate mitigating measures are taken to prevent potential problems. A SUMMARY OF INTERACTING, SURFICIAL GEOLOGIC PROCESSES AND POTENTIAL GEOLOGIC HAZARDS IN THE NORTON BASIN, NORTHERN BERING SEA,
D. R. Thor, and H. Nelson.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 1, p 377-385, 7 fig, 25 ref, OTC No 3400. Offshore Technology Conference, Dallas, TX 1979.

Descriptors: *Hazards, *Geology, *Alaska, *Water pollution sources, Resources development, Leases, Oil pollution, Environmental effects, Baseline studies, Sediments, Erosion, *Outer Continental Shelf, Bering Sea, Norton Sound, Petroleum development.

A dynamic environment of moderate tectonism, sediment instability, and active erosional and depositional processes on the shallow sea floor of northern Bering Sea creates several potential geologic hazards. Active faulting, thermogenic gas seeps, sea-floor gas cratering, sediment liquefaction, ice gouging, scouring-depression formation, storm-sand deposition, and large-scale bedform movement all occur in the study area. Geologic processes may interact to cause such potential hazards as nearsurface faulting south of Nome, Alaska that provides pathways for seeps of thermogenic gas leaking from a large subsurface gas accumulation. Numerous faults also cut the sea floor in the area west of Port Clearance; fault activity is difficult to determine, however, because current scour may be preserving or exhuming old fault scarps. Interaction between the processes of liquefaction and the formation of gas craters, scour depressions, storm-sand deposits, and slumps results in potential sediment instability problems. The widespread occurrence of gas-charged sediment with small surficial craters in central Norton Sound indicates that the sea-floor sediment is periodically disrupted by sudden venting of biogenic gas from the underlying peaty mud. During major storms, liquefaction not only may help trigger crater formation, but also may enhance erosional and depositional processes that create large-scale scour areas and transport sand in the Yukon prodelta area. Interaction of erosional and depositional processes may result in hazards in the shallower parts of northern Bering Sea. (Sinha-OEIS)

NATURAL GAS SEEPAGE ON THE SOUTH TEXAS SHELF,
Texas A and M Univ., College Station.
J. M. Brooks, B. B. Bernard, W. M. Sackett, and J. R. Schwarz.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 1, p 471-478, 7 fig, 1 tab, 20 ref, OTC No 3411. Offshore Technology Conference, Dallas, TX 1979.

Descriptors: *Seepage, *Water pollution sources, *Bacteria, *Texas, Baseline studies, Sediments, Water pollution effects, Environmental effects, Resources development, *Outer Continental Shelf, *Hydrocarbons, Petroleum development.

An area of extensive gas seepage has been found on the South Texas shelf. The seep area extends for a distance of approximately 25 miles on a transect out from the coast at latitude 26 degrees 10 minutes N. Water depths range between 65 and 130 meters. During nine samplings over a three year period, elevated near-bottom concentrations of methane (up to 500 nl/L), ethane (0.6 nl/LO, and propane (0.5 nl/L) compared to nearby surface and other near-bottom waters were observed. Anomalous gaseous hydrocarbon levels were also observed in the interstitial waters at three stations sampled in the region. Ethane and propane concentrations were typically one order of magnitude higher in these sediments compared to typical South Texas shelf sediments. The C sub 1/(C sub 2 + C sub 3) ratios in the sediments were as low as 14 indicating that the seepage may be of a petrogenic origin and not from shallow biogenic (microbial) sources. Significantly higher percentages of hydrocarbonoclastic bacteria were observed in the seep area. These may be a direct result of hydrocarbon seepage. No anomalous interstitial gas concentrations were observed in the 'Serendipity Gas Seep Area' of South Texas. (Sinha-OEIS)

BIOGENIC AND THERMOGENIC GAS IN GAS-CHARGED SEDIMENT OF NORTON SOUND, ALASKA,
K. A. Kvenvolden, C. H. Nelson, D. R. Thor, M. C. Larsen, and G. D. Redden.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 1, p 479-486, 3 fig, 2 tab, 21 ref, OTC No 3412. Offshore Technology Conference, Dallas, TX 1979.

Descriptors: *Hazards, *Geology, *Water pollution sources, *Alaska, *Engineering geology, Sediments, Seepage, Natural gas, Resources development, Baseline studies, Environmental effects, *Outer Continental Shelf, Petroleum development, Biogenic gas, Thermogenic gas.

Chemical and isotopic compositions of sediment gas from Norton Sound have been determined for near-surface, gas-charged sediments at two sites identified in acoustic profiles and bottom observations. At one site air-driven vibracorer penetrated sediment saturated with methane. The isotopic value suggests that the methane originated from active biological processes operating on peat in the top 4 m of sediment. At the other site, characterized by a large subsurface acoustic anomaly, smaller near-surface acoustic anomalies and active seepage of gas, the vibracorer obtained sediment saturated with gas composed of 98% CO2. Associated with the CO2 are minor concentrations of petroleum-like light hydrocarbons. The carbon isotopic compositions of CO2 and methane along with the chemical distribution of gaseous hydrocarbons indicate that at this site these gases are derived from thermal processes operating at depth in Norton Basin. Apparently CO2 from the decarbonation of marine limestone acts as a carrier for hydrocarbon gases that have been generated from organic matter buried in the basin. The gases reach the surface by faults and escape at the seafloor as a submarine seep. The presence of near-surface gas-charged sediment in Norton Sound reduces the stability of the seafloor. Areas where sediments are charged with gas may pose potential hazards for engineering developments. (Sinha-OEIS)

AT-SEA DISCHARGE OF OCEAN MINING PROCESS REJECTS - AN ALTERNATIVE TO LAND DISPOSAL,

C. L. Morgan, and F. T. Lovorn.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 2, p 807-813, 1979. 2 fig, 19 ref, OTC No. 3451. Offshore Technology Conference, Dallas, TX.

Descriptors: *Waste disposal, *Mining, *Water pollution sources, *Baseline studies, Resources development, Water pollution effects, Environmental effects, *Outer Continental Shelf, North Pacific Ocean, At-sea discharge.

The Ocean Minerals Company has carefully evaluated potential impacts of ocean discharge even when most of the evidence suggests that significant impacts do not occur. This 'worst case' approach is similar to that which has been adopted by most principal investigators in the DOMES program. During the last several years an 'in house' project has focused upon a number of topics which compliment those covered by the government programs or which are peculiar to the OMCO system. These include: (1) baseline measurement of metal values in the oceans; (2) determination of the settling rates and solid/liquid composition of various mixtures of seawater and reject materials; (3) comparison of the effects of land-based discharge with the effects of at-sea discharge; and (4) design of a long term environmental monitoring system. To date, these studies indicate that at-sea discharge may cause an insignificant amount of environmental damage and is in many ways preferable to land discharge. (Sinha-OEIS)

A COLLISION AVOIDANCE SYSTEM FOR OFFSHORE OPERATIONS,
R. F. Riggs.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 2, p 1291-1299, 1979. 9 fig, 2 tab, 15 ref, OTC No. 3504. Offshore Technology Conference, Dallas, TX.

Descriptors: *Hazards, *Navigation, *Oil pollution, Oil spills, Water pollution sources, Resources development, *Outer Continental Shelf, Collision avoidance, Oil transport, Predicted-area-of-danger(PAD).

The surge of offshore resource development has resulted in a high density of both fixed and mobile hazards to navigation in some areas. The situation is aggravated when coastal shipping encounters these hazardous areas. Collisions between tankers, rigs, drilling platforms, etc., may result in serious danger to personnel, equipment losses and oil spills. In certain weather conditions, lights and acoustic signaling devices may be ineffective as collision avoidance aids and reversion to radar as the primary sensor may be inevitable. Greatly reduced probability of collision can be achieved through the use of an automated collision avoidance aid that permits rapid assessment of the situation and the determination of a safe, efficient maneuver. Types of operational collision avoidance systems are reviewed and compared. The mix of moving and fixed hazards is one problem that the system must handle. Tidal currents and winds can complicate the maneuvering solution. It is shown that the use of the predicted-area-of-danger (PAD) as a collision avoidance concept overcomes the problems peculiar to maneuvering in offshore gas and oil fields. Experience with the highly successful use of the PAD concept in the dense traffic of the English Channel is reviewed. (Sinha-OEIS)

AN INTRODUCTION TO THE OILSPILL RISK ANALYSIS MODEL,
K. J. Lanfear, R. A. Smith, and J. R. Slack.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 4, p 2173-2181, 11 fig, 4 tab, 7 ref, OTC No 3607. Offshore Technology Conference, Dallas, TX 1979.

Descriptors: *Oil spill, *Hazards, *Models, *Risks, Water pollution effects, Path of pollutants, Environmental effects, Resources development, *Outer Continental Shelf, Petroleum development, Risk analysis.

The U.S. Geological Survey has developed an oilspill risk analysis model to aid in estimating the environmental hazards of developing oil resources in Outer Continental Shelf (OCS) lease areas. This large, detailed, computerized model analyzes the probability of spill occurrence, likely paths of the spills, and locations of recreational and biological resources which may be vulnerable. The analysis implicitly includes estimates of weathering rates, slick dispersion, and possible mitigating effects of cleanup. The probability of spill occurrence is estimated from information pertaining to the volume of oil expected to be produced and the anticipated method and distance of transport. The model provides the Department of the Interior with a method for realistically assessing oilspill risks associated with OCS development. So far, it has been used for analyzing oilspill risks for eight OCS lease sales, and the results have been incorporated into several environmental impact statements. A 'real-time' version was also used to forecast the movement of the Argo Merchant oilspill. Additional model runs are planned for future OCS lease sales in frontier areas. Other possible applications include analysis of OCS development alternatives and site selection for oilspill cleanup equipment. (Sinha-OEIS)

SHIPBOARD OILY WATER POLLUTION - A PRACTICAL GUIDE FOR THE OWNER AND DESIGNER,
A. D. Isaacson.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 4, p 2183-2192, 5 fig, 12 ref, OCT No 3608. Offshore Technology Conference, Dallas, TX 1979.

Descriptors: *Oil pollution, *Pollution abatement, *Water pollution control, Resources development, Oily water, Ships, Regulation, Transportation, *Outer Continental Shelf, Petroleum development, Oily water separators.

This paper is presented as an aid in understanding the U.S. and International (IMCO) regulations with regard to shipboard oil pollution and as a guide for selecting and installing an oily water separating device as it pertains to a particular situation. The information presented is based upon recent projects in which various type vessels have been upgraded to comply with oil pollution regulations. The latest information regarding IMCO and US Coast Guard regulations as applicable to new and existing vessels are presented as well as means for complying. Covered are the various areas of possible shipboard oily water contamination such as machinery bilges, tank cleaning and oil transfer operations. Commercially available oily water separators are discussed and presented to assist the reader to judge the applicability for his particular case. (Sinha-OEIS)

WESTERN GULF OF ALASKA SEISMIC RISK,
Alaska Univ., Fairbanks. Geophysical Inst.
H. Pulpan, and F. Kienle.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 4, p 2209-2218, 12 fig, 19 ref, OTC No 3612. Offshore Technology Conference, Dallas, TX 1979.

Descriptors: *Seismic studies, *Hazards, *Alaska, *Risks, Model studies, Baseline studies, Water pollution sources, Resources development, *Outer Continental Shelf, Petroleum development.

Seismicity studies, based on both historic data and data accumulated from the operation of a high resolution seismic network, provide some important input into quantitative seismic risk studies for areas of offshore petroleum development in Lower Cook Inlet, Shelikof Strait and off Kodiak Island. The greatest seismic risk is associated with the shallow seismic thrust zone of the subducting Pacific plate. There is a high probability that a great earthquake will occur in the Shumagin gap within the lifetime of any potential petroleum development in that area. The relative sharpness of the transarc boundaries of the aftershock zones of great earthquakes in the Aleutians suggests that a shallow thrust zone is segmented into separate tectonic blocks within release accumulated strain independently. There is geologic and seismic evidence that one such boundary traverses the arc near the southern edge of Kodiak and separates the 1964 aftershock zone from the Shumagin gap. Additional segmentation may exist within the 1964 aftershock zone. Seismic risk appears lower in the other offshore areas that do not overlie the shallow subduction thrust zone, but is still primarily associated with the subduction process. The shallow, crustal seismic activity (less than 50 km hypocentral depth) outside the subduction thrust zone does not correlate with the major known fault systems of the area, and is of a more diffuse nature. (Sinha-OEIS)

A SEA-FLOOR SEISMIC MONITORING NETWORK AROUND AN OFFSHORE OILFIELD PLATFORM AND RECORDING OF THE AUGUST 13, 1978 SANTA BARBARA EARTHQUAKE,
University of Southern California, Los Angeles.
T. L. Henyey, T-I. Teng, J. K. McRaney, and D. V. Manov.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 4, p 2219-2223, 6 fig, 16 ref, OTC No 3613. Offshore Technology Conference, Dallas, TX 1979.

Descriptors: *Hazards, *Seismic studies, *Risks, *Monitoring, *California, Offshore platforms, Water pollution sources, Resources development, Oil fields, Earthquakes, *Outer Continental Shelf, Petroleum development, Santa Barbara(CA) earthquake.

An eight element seismic monitoring array has been established around the Dos Cuadras offshore oil field in the Santa Barbara Channel, a highly faulted region with a history of important seismicity. The array consists of five sea floor seismometers and three onshore coastal zone stations. The proper mechanical coupling of ocean-bottom seismometers to the sea floor has been a problem. The existence of a layer of soft sediments on top of the sea floor often results in severe attenuation of the transmitted seismic waves. A method has been devised of installation whereby the sea floor sensors are inserted into pipes vibracord 2-5 meters into the sea floor where water depths range from 20 to 100 meters. The sensor outputs are transmitted by sea floor coaxial cables to a central platform and then telemetered (in combination with the onshore stations) via telephone line to a recording facility in Los Angeles. Records from the August 13, 1978 Santa Barbara earthquake and its aftershocks demonstrate that the method of sensor emplacement used gives superior coupling to the sea floor resulting in a record with low distortion and good signal to noise characteristics. The minimum detection threshold for events within the Dos Cuadras field should be on the order of M = 1.5 with epicentral locations determined to better than 1 km. The added complexities of offshore oil fields enhance the desirability of a comprehensive seismic monitoring effort. (Sinha-OEIS)

ENVIRONMENTAL HAZARDS: CONSIDERATIONS FOR OUTER CONTINENTAL SHELF DEVELOPMENT,
P. G. Teleki, L. E. Garrison, and M. A. Hampton.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 4, p 2579-2589, 66 ref, Oct No 3654. Offshore Technology Conference, Dallas, TX 1979.

Descriptors: *Hazards, *Resources development, *Risks, *Baseline studies, Environmental effects,

Water pollution sources, United States, Oil pollution, Offshore platforms, *Outer Continental Shelf, *Potential hazards, Petroleum development.

Expansion of offshore petroleum operations into unknown frontier areas, deeper waters, and more hostile environments has increased industry's and the Government's awareness about environmental hazards on the Outer Continental Shelf (OCS). Data on environmental exposure are absent in the public domain although these data (1) are needed to test engineering concepts for the design of offshore structures, (2) are factors in leasing on the OCS, and (3) govern economic decisions on petroleum exploration and production. The summary of environmental hazards on the U.S. Continental Shelf presented shows much variability in the hazard potential among OCS areas and complex interactions among various types of hazards within a single area. The U.S. Geologic Survey is actively studying the stability and properties of marine sediments, extreme wave conditions, earthquake-induced ground motion, and arctic sea ice and permafrost to improve its understanding of the processes governing the existence and behavior of these hazards. AUTOMATED SAMPLING ANALYSIS OF RURAL NONPOINT SOURCE WATER QUALITY,
North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
L. F. Bliven, F. J. Humenik, F. A. Koehler, and M. R. Overcash.
Paper No. 78-2509, Presented at the 1978 Winter Meeting of the American Society of Agricultural Engineers, December 18-20, 1978, Chicago, Illinois, 10 p. 5 fig, 4 tab, 18 ref. ASAE, St. Joseph, Michigan.

Descriptors: Water quality, Water pollution, Water sampling, Water pollution sources, *Automation, Water yield, Ion transport, Base flow, Flow duration, *Nonpoint pollution.

Automated sampling was employed to assess constituent (COD, TOC, TP, TKN, NO3-N, and Cl) yields and concentrations from two Piedmont sites in Virginia and two poorly-drained Coastal Plain sites in North Carolina within the Chowan River watershed. These data were analyzed to provide a mechanistic interpretation of subbasin processes. Characteristic Piedmont and Coastal Plain seasonal water yield cycles which have winter maximums and summer minimums were related to regional potential water yields (rainfall minus evapotranspiration). Large water yield variations for subbasins within each region, however, were attributed to physical differences between subbasins. Greater water yield from the agricultural Piedmont site than from the forested Piedmont site reflected increased cleared land plus greater channelization both on the basis of channel density and channel gradient at the agricultural site. Elevated baseflow, probably due to stream channelization, was the dominant factor contributing to water yield due to stream channelization, was the dominant factor contributing to water yield differences between two Coastal Plain subbasins. Surface flow COD, TOC, TP, TKN and NO3-N concentrations were usually greater than baseflow concentrations, but at the unchannelized Coastal Plain site the opposite case prevailed and at all sites surface flow Cl concentrations were less than baseflow concentrations. The seasonal concentration cycle displayed a summer maximum and winter minimum and thus it was out of phase with the water yield cycle. (Skogerboe-Colorado State)

STORM RUNOFF MICROBIOLOGY ADDS TO CONCERNS,
Ontario Ministry of the Environment, Rexdale.
A. A. Qureshi, and B. J. Dutka.
Water and Sewage Works, Vol 126, No 3, p 86-88, March 1979. 1 fig, 2 tab, 7 ref.

Descriptors: *Water pollution sources, *Canada, *Urban runoff, *Storm drains, *On-site investigations, Storm runoff, Surface runoff, Water sampling, Water pollution, Pollutants, Coliforms, Fungi, Pathogenic bacteria, Analysis, Methodology, Testing procedures.

A storm sewer outfall on Malvern Road in Burlington, Ontario, (population 104,000) was selected as a study site. This outfall empties directly into small creek and drains a 23.3 ha section of central Burlington. The entire area is zoned as single-family, residential, and there are no vacant lots within the area. The majority of the houses have eaves-troughs connected directly to storm sewers that are 100% separated. Routine microbiological samples for coliforms, fecal coliforms, fecal streptococci, Pseudomonas aeruginosa, fungi, heterotrophs, salmonella/100 ml, and Leptospira/100 ml were hand-collected at the weir outfall. The first samples were collected after the rain started, as soon as there was a noticeable change in the flow rate. Traditional indicator densities such as coliforms, fecal coliforms, and fecal streptococci approached dilute sewage concentrations during each event, thus reemphasizing the health hazards due to pathogenic bacteria and viruses that are contained within these storm-runoff waters. Indications were that it is not possible to predict peak time for microbial populations to occur in runoff waters or the appearance of human pathogens. (Humphreys-ISWS)

ON THE CONCENTRATION OF SULFATE IN PRECIPITATION,
Battelle Pacific Northwest Labs., Richland, WA.
B. C. Scott, and N. S. Laulainen.
Journal of Applied Meteorology, Vol 18, No 2, p 138-147, February 1979. 6 fig, 4 tab, 26 ref. ERDA EY-76-C-06-1830.

Descriptors: *Sulfates, *Precipitation(Atmospheric), *Nucleation, Air pollution, Clouds, Cloud physics, On-site investigations, Radar, Sampling, Chemical analysis, Drops(Fluid), Snow, Aerosols, Chemicals, Sulfur compounds, Meteorology.

Two case studies were used to examine the relationship of the sulfate concentration in surface precipitation to the microphysical characteristics of the precipitating cloud systems. The data from one case study supported the contention that existing sulfate aerosol was incorporated into cloud water by the nucleation process and accounted for nearly all of the observed cloud and precipitation water sulfate concentration. These activated sulfate particles comprised nearly 60% of the clear-air sulfate mass concentration. Once nucleated, the sulfate particles accumulated water through the condensation process and were subsequently deposited at the surface after accretion on large snowflakes. The presumption of aqueous phase sulfate oxidation of SO2 was not necessary to account for the observed sulfate concentrations. The data from the second case study were more limited and difficult to interpret. Nucleation and below cloud washout appeared to be the main contributors to the surface concentration in precipitation water. (Sims-ISWS)

TRANSPORT OF REACTING ADMIXTURES IN A TURBULENT FLOW,
Akademiya Nauk SSSR, Moscow. Inst. Vodnykh Problem.
B. A. Fidman.
Water Resources, Vol 4, No 6, p 918-925, November-December 1977. 10 ref. Translated from Vodnye Resursy, No 6, p 148-155, November-December 1977.

Descriptors: *Turbulent flow, *Mixing, *Suspended solids, *Pollutants, Water pollution, Diffusion, Dispersion, Model studies, Mathematical models, Equations, Sediment transport, Streams, Streamflow, Hydraulics, Hydrology.

The transport by turbulent flows of admixtures which can react with solutions or fine particles contained in the water is of interest, particularly when analyzing processes of pollution and self-purification of streams and water bodies. This article touched on (as a brief review with explanations and comments) certain characteristics of the joint action of turbulent diffusion and kinetics of the reactions. An estimation of the parameters of transport and mixing of reacting admixtures in a turbulent flow as a consequence of a number of simplifying assumptions can give only rather rough, approximate results. Refinement and broadening of the results obtained as applied to more complex conditions requires the further development of investigations of turbulent transport and, in turn, such characteristics of it as longitudinal dispersion and the transverse (horizontal) turbulent diffusion determining it in natural and regulated streams. Further actual measurements on large streams, permitting an empirical determination of the values of longitudinal dispersion, are also needed. (Sims-ISWS)

FACTORS GOVERNING THE BIOLOGICAL PRODUCTIVITY, REGIME, AND CONTENT OF BIOGENIC AND ORGANIC SUBSTANCES IN THE SEQUENCE OF DNEPR RESERVOIRS,
Akademiya Nauk URSR, Kiev. Inst. Hydrobiologii.
A. I. Denisova.
Water Resources, Vol. 4, No. 6, p 885-895, November-December 1977. 4 tab, 13 ref. Translated from Vodnye Resursy, No. 6, p 106-119, November-December 1977.

Descriptors: *Organic matter, *Biological properties, *Water quality, *Reservoirs, Nutrients, Nitrogen compounds, Phosphorus, Vegetation, Trees, Phytoplankton, Runoff, Rivers, Water pollution, Water pollution sources, *Dnepr River(USSR), Biogenic matter.

Organic and biogenic substances, being the basis of biological productivity of water bodies, in the majority of cases determine also the quality of water used for various economic purposes. Systematic investigations carried out on reservoirs of the Dnepr River over the course of two decades (1955-1975) revealed the main factors and processes governing the content, dynamics, and transformation of bioelements in reservoirs and their bio-

logical productivity. The content of biogenic and organic substances in water of reservoirs depends on two diametrically opposite processes: on one hand, on their entry with different sources and, on the other, on their removal from the aquatic environment in the form of the end products of mineralization of substances of plant and animal origin, sedimentation, consumption by aquatic organisms, binding by heavy metals into stable complexes, etc. The sources enriching the water of Dneper reservoirs in biogenic elements and organic substances of both natural and antropogenic origin include: the runoff of the main river feeding the sequence of reservoirs, surface runoff and interflow from the drainage basin, flooded bed (in the first years), industrial and domestic wastewaters, runoff from farmlands, precipitation, erosion of the shores, bottom deposits, in situ processes, etc. Their quantitative evaluation, made on the basis of experimental and actual investigations or by calculations, was presented. ACCURACY EVALUATION IN THE CALCULATION OF MASS-DISCHARGES,
National Inst. of Scientific Research (Quebec).
H. Weber, D. Cluis, and B. Bobee.
Journal of Hydrology, Vol. 40, No. 1/2, p 175-184, January 1979. 3 fig, 9 ref.

Descriptors: *Water quality, *Dissolved solids, *Discharge(Water), *Hysteresis, Sampling, Variability, Statistical methods, Simulation analysis, Flow, Estimating, Analysis, Equations, *Mass discharge, *Concentration, *Nonpoint sources, *Saint-Francis River.

Water quality sampling programs are designed mostly upon known or assumed variabilities of the concentrations. As one goes further into the interpretation of this information, mass-discharge calculation is often required afterwards for the evaluation of transport phenomena. The accuracy of mass-discharges is generally related to the errors in the flow and concentration measurements, but the inaccuracy resulting from the computational procedure itself is often overlooked, leading to gross misinterpretations. In the common case of a basin with composite land-uses, no clear-cut relationship between concentrations and discharges can be expected. With discharges available on a daily basis and water quality samplings occurring at periodic intervals, several approximation formulas for mass-discharge computation are available. A formulation was retained taking advantage of the whole information content of the measurements, and a simulation technique was applied to estimate its accuracy. The results were then presented in terms of accuracy estimations in relation to the frequencies of sampling and to the intrinsic variabilities and relative cyclicities of concentrations and discharges. LINE PLUME AND OCEAN OUTFALL DISPERSION,
Georgia Inst. of Tech., Atlanta. Dept. of Civil Engineering.
P. J. W. Roberts.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY4, Proceedings Paper 14488, p 313-331, April 1979. 12 fig, 12 ref, 2 append.

Descriptors: *Outfall sewers, *Dispersion, *Diffusion, *Waste dilution, Mixing, Flow, Currents(Water), Buoyancy, Model studies, Mathematical models, Laboratory tests, Froude number, Equations, Oceans, Waste disposal, Plumes, Dilution, Diffusers.

The three-dimensional flowfield created by a line plume of finite length in a steady unstratified current was investigated experimentally and theoretically. The results are applicable to ocean sewer outfall design. Even though the diffuser length may be much greater than the water depth, the flowfield cannot be considered to be two-dimensional. The most important dynamic parameter is a Froude number, F, given by the ratio of the current speed cubed to the buoyancy flux discharged per unit diffuser length. Different mixing regimes can occur depending on the value of F, and the plume can be attached to the lower boundary. Dilution depends on current speed and direction only for F greater than 0.1. For F greater than 0.1, dilution increases with current speed, and diffusers perpendicular to the current will result in greater dilution than if parallel. The surface wastefield spreads rapidly in a parallel current, showing that Y or similarly shaped diffusers are not essential to produce a widely dispersed wastefield. The buoyant spreading of the surface wastefield is a complex phenomenon, having growth laws that change with distance downstream. (Sims-ISWS)

FINAL REPORT ON THE BASELINE ENVIRONMENTAL SURVEY OF THE MAFLA LEASE AREAS.
State Univ. System of Florida Inst. of Oceanography, St. Petersburg.
Final Report, April 1978. J. E. Alexander, (Ed.). 200 p, 11 fig, 37 tab. 08550-CT4-11.

Descriptors: *Baseline studies, *Water pollution sources, *Water pollution effects, *Gulf of Mexico, Environment, Resources development, Exploration, Oil, Gases, Chemistry, Biota, Geology, *Outer Continental Shelf, Petroleum development, Mississippi-Alabama-Florida(MAFLA).

In this baseline study, the State University System of Florida, Institute of Oceanography (SUSIO) Consortium's survey was directed and largely restricted to five discrete lease areas on the Mississippi-Alabama-Florida (MAFLA) shelf of the eastern Gulf of Mexico, extending from approximately 89 degrees W, south of Pascagoula, Mississippi, to a tract west of Clearwater, off Tampa Bay, Florida. Existing pollutants in the offshore submerged land area are an important consideration, for in order to make meaningful use of baseline surveys on the shelves one must quantify contaminant levels, as well as be able to determine their origin. The chief objective of this study, as mandated by the Bureau of Land Management, was to sample water, sediments and organisms on the leased tracts before arrival of drilling rigs in mid-summer of 1974. THE RELATIONSHIP BETWEEN BEST MANAGEMENT PRACTICES AND RECEIVING-WATER STANDARDS,
URS Co., Seattle, WA.
G. R. Minton, D. Anderson, and A. Coburn.
Water Resources Bulletin, Vol. 14, No. 6, p 1440-1448, December 1978. 28 ref.

Descriptors: *Nonpoint pollution, *Standards, *Water pollution control, *Management, *Receiving water, *Regulation, Best management practices, Programs, Legislation.

An important enforcement question is, 'What should be the relationship between 'Best Management Practices' (BMP) and receiving-water standards.' Nonpoint pollution discharges are concerned about implementing a BMP program, only to find themselves in violation because receiving-water standards still have not been met. They are also concernd about the procedures a regulatory agency will utilize to determine the relative success of a BMP program. Successful management of nonpoint pollution requires that these concerns be addressed. Three alternative relationships have been developed. The recommended alternative is to implement the BMP program and use standards as a measure of the effectiveness of the program. Failure to achieve the standards would lead to a reevaluation of the BMP program. Enforcement activities against nonpoint dischargers would be restricted to the failure on their part to implement the previously agreed upon BMP program. Recommendations are also made as to measures regulatory agencies should take if their procedures to judge the relative success of a BMP program are to be technically and politically effective. SURFICIAL SEDIMENTS,
National Oceanic and Atmospheric Administration, Miami, FL. Atlantic Oceanographic and Meteorological Labs.
G. L. Freeland, and D. J. P. Swift.
MESA New York Bight Atlas Monograph 10. New York Sea Grant Institute Report No NYSSG-AM-78-004, December 1978. 93 p, 11 fig, 2 tab, 116 ref, 64 maps, 2 append.

Descriptors: *Sediments, *Bottom sediments, *Water pollution sources, *Waste disposal, *Water pollution effects, Spoil banks, Outfall sewers, Sewage sludge, Continental Shelf Environmental effects, *Outer Continental Shelf, *New York Bight, *Ocean dumping, Dredge spoil.

The surficial sediment cover of the continental shelf in New York Bight consists of a sheet of sand up to 10 m thick with small areas of gravel and muddy sand. Off the shelf edge, mud increases to become the dominant sediment. Most sediment was first deposited during or soon after the last glacial maxima when the present shelf was land and has been reworked by the advancing shoreline. Most shelf morphologic features also reflect these conditions. Modification of the natural pattern of sedimentation has occurred in the Bight apex where man has dumped his wastes for over 60 years. Dredge spoil dumping has created several knolls

on the bottom, and with outfalls, the dumping of sewage sludge, acid wastes, construction, and other rubble, has made the apex a 'worst case' example of ocean pollution. With proper management of municipal and industrial wastes, however, the apex may eventually return to a near-natural setting--still in use by man, but without harmful ecological effects. (NOAA)

CONTROLLING NONPOINT EXTERNALITIES WITH INPUT RESTRICTIONS IN AN IRRIGATED RIVER BASIN,
Nebraska Univ., Lincoln. Dept. of Agricultural Economics.
G. H. Pfeiffer, and N. K. Whittlesey.
Water Resources Bulletin, Vol. 14, No. 6, p 1387-1403, December 1978. 4 fig, 4 tab, 15 equ, 17 ref. OWRT B-059-NEB (1).

Descriptors: *Nonpoint pollution, *Water pollution control, Economics, Irrigation, *Yakima River Basin(Washington), Linear programming, Simulation analysis, Mathematical models, Sediments, Return flow, Nitrogen, Surface waters.

Irrigated agriculture is a major nonpoint source of surface water quality degradation. Nonpoint source discharges can be controlled by either output taxes or restrictions, or by input taxes or restrictions. The economic theory of externality control with taxes or restrictions on input use is developed. The effectiveness of alternative output control policies in improving surface water quality is demonstrated with a mathematical model of the agriculture and water quality in the Yakima River Basin, Washington. A linear programming model of the farm sector of the Basin in conjunction with a simulation model of environmental quality has been constructed, considering river nitrogen concentration, water temperature, and cropland soil losses. Producer and social abatement costs are the most important measures of policy effectiveness. Sediment loss and river temperature are functionally related to water use. Nitrogen concentration is controlled most efficiently by controlling the use of both fertilizer and water, while sediment and temperature are reduced most efficiently by reducing irrigation water use. RELATIONSHIPS BETWEEN CONCENTRATIONS AND DISCHARGE ON SELECTED ILLINOIS STREAMS,
Northern Illinois Univ., DeKalb. Dept. of Geology.
L. J. Vendl.
Report of Investigations, No. 17, January 1979. 32 p, 8 fig, 2 tab, 37 ref, 1 map.

Descriptors: *Streams, *Water quality, *Illinois, *Watersheds(Basins), Discharge(Water), Data collections, Analytical techniques, Alkalinity, Turbidity, Dissolved solids, Ammonia, Nitrogen, Metals, Iron, Fluorides, Silica, Hydrogen ion concentration, Phosphates, Potassium, Boron, Calcium, Chlorides, Copper, Sulfates, Coliforms, Magnesium, Manganese, Nitrates, Sodium, Total dissolved solids, Barium.

All naturally occurring stream waters contain dissolved materials. By analyzing chemical concentration behavior with respect to discharge, one can begin to answer some major questions concerning the dissolved mineral concentration: (1) What effects do changing discharge conditions have on a chemical constituent's concentration. (2) How do changing seasonal discharges effect concentration of these constituents. (3) What can be said about the source (namely base flow, shallow groundwater, surface runoff, point sources and non-point sources) of the constituent by analyzing the discharge and concentration relationships. In this study, 23 constituents were analyzed using a graphical and descriptive approach in order to answer these questions concerning concentration and water discharge relationships. In an attempt to evaluate the differences between water chemistry, physiography, climate, geology, land use, and drainage characteristics, 4 representative drainage basins were selected for study. These are the Fox River above Algonquin, the Sangamon River above Mahomet, the Little Wabash River above Carmi, and the Big Muddy River above Murphysboro. Most constituents showed a seasonal variation in concentration. Variations in the concentration of each constituent from basin to basin reflect the combination of many factors including the type, magnitude, and sources (such as natural or anthropogenic) of each constituent and the assimilation capacity and discharge conditions of the given stream. BIOLOGICAL IMPLICATIONS OF METALS IN THE ENVIRONMENT.
Available from the National Technical Information Service, Springfield, VA 22161 as CONF-750 929, Price codes: A99 in paper copy, A01 in microfiche. Report No. ERDA Symposium Series 42, June 1977. Proceedings of Fifteenth Annual Hanford Life Sciences Symposium at Richland, Washington, September 29-October 1, 1975. 691 p, 259 fig, 175 tab, 1344 ref.

Descriptors: *Metals, *Trace elements, *Biochemistry, Animal metabolism, Plant tissues, Soils, Sediments, Water, Water analysis, Water chemistry, Fertilizers, Animal growth, Ecosystems, Foods, Food chains, Heavy metals, Sewage sludge, Land use, Environmental effects, Mathematical models, Adsorption.

Forty papers by scientists engaged in research programs on trace metals in the environmental and biological areas are presented. The metals mercury, platinum arsenic, zinc, copper, lead, cobalt, silver, iron, manganese, and selenium are discussed. The topics covered include uptake of these metals by plants and animals; the forms of trace elements in soils, sediments and water; adsorption of metals; fallout of toxic metals; metal toxicity to a biological system; heavy metal content of vegetable species grown in soil amended with sewage sludge; heavy metal contaminants in fertilizers; trace metals in ecosystems; and the ecological and land-use relationships of toxic metals. A mathematical model to simulate metal uptake by plants growing in soil is presented. Each paper is accompanied by an abstract and list of references; an index is provided. (Davison-IPA)

EVALUATION AND CORRELATION OF WATER-QUALITY DATA FOR THE NORTH FORK FLATHEAD RIVER, NORTHWESTERN MONTANA,
Geological Survey, Helena, MT. Water Resources Div.
J. R. Knapton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-292 702, Price codes: A06 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 78-111, November 1978. 95 p, 22 fig, 10 tab, 18 ref.

Descriptors: *Water quality, *Streamflow, *Sediment transport, *Montana, Dissolved solids, Specific conductivity, Trace elements, Evaluation, Regression analysis, Correlation analysis, Computer programs, Baseline studies, Land use, *North Fork Flathead River(Mont), British Columbia, Alberta.

This report is a compilation and evaluation of water-quality measurements that have been made by the U.S. Geological Survey at two stations on the North Fork Flathead River in Montana. Historical streamflow records show an annual mean daily discharge of 3,010 cubic feet per second near the mouth--a threefold increase compared to discharge at the international boundary. The chemical character of the water is dominated by calcium and magnesium cations and the bicarbonate anion. Base flow, in contrast to high flows from runoff, is characterized by higher dissolved constituents and lower concentrations of suspended sediment. The several lakes that contribute water throughout the middle and lower drainage have a dampening effect on both streamflow and constituent concentrations. Using the available data and computer techniques, regression equations were developed between certain water-quality variables. (Woodard-USGS)

METHANE MIGRATION AROUND SANITARY LANDFILLS,
Ohio State Univ., Columbus. Dept. of Civil Engineering.
C. A. Moore, S. R. Igbal, and A. A. Alzoydi.
Journal of the Geotechnical Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 105, No. GT2, February, 1979. 12 fig, 2 tab, 17 ref, 1 append.

Descriptors: *Computer models, *Methane, *Landfills, *Migration, Groundwater, Water table, Hazards, Explosions, Forecasting, Flow, Gases, Finite element analysis, Charts.

The decomposition of refuse in sanitary landfills results in the generation of methane gas which, when mixed with air, creates an explosion hazard for buildings near landfills. A study was undertaken to develop predictive models for methane migration around landfills using combined transition region multicomponent flow of gases in porous media. A user oriented finite difference code was developed to describe methane migration. Input data consists of landfill geometry, soil type, gases, decomposition history, time steps, program termination, and frequency of printout. The output shows methane concentrations as a function of position. For complex soil configurations, a finite element computer model was developed using axisymmetric geometry and isoparametric elements to define the distribution of soil types. The predictive models have received limited field verification based on data available in the literature. Verification under more controlled conditions is needed to establish reliability of the models. (Purdin-NWWA)

EFFECT OF UPGRADING A MUNICIPAL WASTEWATER EFFLUENT ON POLLUTION INDICATOR AND OTHER MICROORGANISMS IN RIVER WATER,
Connecticut Univ., Noank. Marine Research Lab.
E. A. Matson, S. G. Hornor, and J. D. Buck.
Environmental Science and Technology, Vol. 13, p 460-465, April 1979. 5 fig, 6 tab, 48 ref. OWRT A-052-CONN(19). 14-34-001-9007.

Descriptors: *Microorganisms, *Coliforms, *Yeasts, *Activated sludge, Chlorination, Rivers, *Bioindicators, Municipal wastes, *Sewage treatment, Streptococci, Bacteria, Willimantic/Shetucket River, Connecticut.

Densities of total and fecal coliforms, fecal streptococci, plate count bacteria, and certain yeasts were monitored in an eastern Connecticut watershed for 1 year prior to upgrading a municipal primary settling treatment plant to activated sludge and sampling was continued for 19 months afterward. Substantial reductions in densities of indicator and other bacteria and yeasts upstream of the effluent after upgrading were associated with lower annual precipitation and reduced precipitation-associated sampling. The effluent dilution decreased from 0.84 to 1.42% of river volume due to increased daily treatment plant discharge and decreased river

discharge. Calculated reductions in effluent discharge of indicators ranged from 10% (total coliforms) to 84% (fecal coliforms), while the discharge of 'total plate count bacteria' increased 500%. Chlorination procedures were still required to reduce river total coliform densities below the accepted limit. Within the microbiological perspective, upgrading this treatment plant was of limited value to potential water users. (deLara-Conn)

SOME PROBLEMS IN EVALUATING THE ABILITY OF STRATA TO STORE OR TRANSMIT POLLUTANTS,
Manchester Univ. (England). Dept. of Civil and Structural Engineering.
F. T. Howell.
Water Services, Vol. 82, No. 992, p 668-672, October, 1978. 8 fig, 23 ref.

Descriptors: *Water pollution, *Groundwater, *Migration, *Storage, Aquifers, Permeability, Geologic investigations, On-site investigations, Evaluation, Forecasting, Risks, Pollutants.

Ground water pollution includes any changes in ground water quality which are detrimental to present or future users. If pollutants are placed on, or in the ground, they may migrate or remain in storage depending upon the local hydrogeologic conditions. Problems and errors that occur in the geotechnical investigation, interpretation, and prediction of future changes in these conditions are examined in detail. The consequences of incorrect prediction of the migration or storage properties of strata depend not only upon the magnitude of the error, but also upon the nature of the pollutant and its location in the total environment. In the case of predicting migration, any errors are concerned with the rate of migration, direction, and longevity of the pollution. In the storage situation, the strata or barriers are expected to remain impermeable and prevent the migration of highly toxic fluids. Any activity involving underground pollutants contains an element of risk. However, this must not be used as an excuse to reject proposals concerning pollutants in strata. Nevertheless, it is imperative that decisions are formulated in the full light of the correct appraisal of the ability of the strata to transmit or store pollutants during the lifespan of their effectiveness. WATERBORNE DISEASE - A STATUS REPORT EMPHASIZING OUTBREAKS IN GROUND WATER SYSTEMS,
Health Effects Research Lab., Cincinnati, OH.
G. F. Craun.
Ground Water, Vol. 17, No. 2, p 183-191, March-April, 1979. 8 tab, 27 ref.

Descriptors: *Diseases, *Water supply, *Groundwater, Water pollution, Water treatment, Municipal water, Statistics.

Between 1971 and 1977 a total of 192 outbreaks of waterborne disease affecting 36,757 persons were reported in the United States. An etiological agent was determined in only 43% of the outbreaks. Giardiasis was more common in surface water system while Shigellosis occurred more often in ground water systems. More outbreaks occurred in nonmunicipal water systems (70%) than municipal-water systems, however, more illness (67%) resulted from outbreaks in municipal systems. Nearly half of the outbreaks (49%) and illness (42%) were caused by the use of untreated or inadequately treated ground water. Contamination by sewage effluent, primarily from septic tanks or cesspools, was responsible for 42% of the outbreaks and 71% of the illness caused by use of untreated ground water. The major causes of outbreaks in municipal systems were contamination of the distribution system and treatment deficiencies which accounted for 68% of the outbreaks and 75% of the illness occurring in municipal systems. Use of untreated ground water was responsible for only 10% of the municipal system outbreaks and 1% of the illness. Inadequate and interrupted treatment or lack of treatment of ground water sources were responsible for 78% of the outbreaks and 94% of the illness in nonmunicipal-water systems. (Purdin-NWWA)

HEAVY METAL CONTAMINATION OF SURFACE WATERS AND FISH FLESH IN SOUTH CAROLINA,
Clemson Univ., SC. Dept. of Environmental Systems Engineering.
A. R. Abernathy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 215, Price codes: A07 in paper copy, A01 in microfiche. Water Resources Research Institute, Clemson University, Report No. 74, March 1979. 119 p, 6 fig, 29 tab, 120 ref, 3 append. OWRT A-032-SC(4).

Descriptors: *Heavy metals, Water pollution effects, Mercury, Cadmium, Arsenic, Reservoirs, *Surface water, *Fish, South Carolina, Lake Keowee, Lake Jocassee.

A study was made from July 1974 to June 1976 of the major reservoirs in South Carolina for mercury, cadmium, and arsenic in water, sediments, and fish flesh. Mercury was found to exceed the FDA action level of 0.5 ppm in flesh of fish taken from Lakes Keowee and Jocassee. Most fish from other waters had concentrations of mercury lower than 0.5 ppm. No unusual concentrations of mercury were found in water or sediments. Local concentrations of cadmium were found in a stream receiving plating wastewater, but no other problems of high concentrations of cadmium or arsenic were located.
W79-06914

SIZE DEPENDENT MODEL OF HAZARDOUS SUBSTANCES IN AQUATIC FOOD CHAIN,
Manhattan Coll., Bronx, NY.
R. V. Thomann.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 009, Price codes: A04 in paper copy, A01 in microfiche. Report No. EPA-600/3-78-036, April 1978. 48 p, 11 fig, 7 tab, 45 ref. R803680030.

Descriptors: *Path of pollutants, *Food chains, *Water pollution, *Mathematical models, Ecosystems, Aquatic animals, Aquatic habitats, Equations, Analytical techniques, Tracking techniques, Ecology, Food webs, Lake Ontario, Wastes.

A mass balance model using organism size as an independent variable is constructed to track bioaccumulation of toxic substances in freshwater ecosystems and subsequent transfer up the food chain. Since this model represents size dependent ecological continuum, classical compartment analyses becomes a special case. Size dependence is viewed as an approximate ordering of trophic position. To illustrate this theory the analysis of some PCB data in Lake Ontario was used with a completely mixed water volume; PCB data on net plankton, alewife, smelt, sculpin and coho salmon were used. Preliminary estimates of the model coefficients were made with the field data and laboratory data from the literature. The results indicated that about 30% of the observed 6.5 micrograms of PCB/gram fish at the coho salmon size range was due to transfer from lower levels in the food chain and about 70% was due to direct water intake. The rapid accumulation of PCB with organism size as shown by the model, was due to decreased excretion rates and decreased biomass at higher trophic levels. It is concluded that this equation permits rapid solution for the distribution of the toxicant throughout the food chain, but the present form of the size dependent model does not permit detailed analysis on any one segment of the ecosystem. (Davison-IPA)

INDUSTRIAL PROCESS PROFILES FOR ENVIRONMENTAL USE: CHAPTER 9. THE SYNTHETIC RUBBER INDUSTRY,
Radian Corp., Austin, TX.
J. Parr, T. B. Parsons, and N. P. Phillips.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 480, Price codes: A05 in paper copy, A01 in microfiche. Report EPA-600/2-77-023i, 1977. 92 p, 3 fig, 45 tab, 50 ref, 3 append.

Descriptors: *Industrial wastes, *Synthetic rubber, *Organic compounds, *Water pollution sources, *Organic wastes, Chemical wastes, Industrial water, Operations, Industrial production.

The environmental impacts of the synthetic rubber industry are examined. Emulsion crumb production processes are described including: monomer storage, caustic wash, polymerization, light monomer recovery, heavy monomer recovery, coagulation and screening, and crumb washing, drying, and finishing. Latex production processes are described including polymerization, light monomer removal, heavy monomer removal, and blending, storage, and shipping. Solution crumb production processes include feed drying, polymerization, cement storage, stripping and coagulation, monomer and solvent recovery, and dewatering and product finishing. The largest source of pollution is aqueous emissions. Some organic compounds identified in effluents from synthetic rubber plants are 2, benzothiazole, n-butylisothiocynate, bis-2-chloroethyl-ether, p-dithiane, styrene, and triethylurea. (Small-FRC)
W79-06959

INDUSTRIAL PROCESS PROFILES FOR ENVIRONMENTAL USE: CHAPTER 12. THE EXPLOSIVES INDUSTRY,
Radian Corp., Austin, TX.
C. E. Hudak, and T. B. Parsons.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 641, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-77-023L, 1977. 125 p, 12 fig, 38 tab, 19 ref, 3 append.

Descriptors: *Industrial wastes, *Water pollution sources, *Explosives, *Waste water, *Organic compounds, Chemical wastes, Air pollution, Solid wastes.

The environmental impacts of the explosive industry are discussed. The explosives industry includes companies which manufacture organic nitration products and formulate mixtures of chemicals with explosive properties. Five nitration processes are described: TNT production processes, Nitrocellulose production processes, RDX/HMX production processes, Nitroglycerin production processes, and Pentaerythritol Tetranitrate production processes. Also, the production of nitric acid is described. Liquid wastes from these processes contain various significant pollutants and potential pollutants. Six process flow charts and fifteen process descriptions are presented to characterize the industry. Input materials, operating parameters, utility requirements, and waste streams are described. In addition to waste water problems, air pollution and solid waste disposal problems are considered. (Small-FRC)
W79-06960

NDUSTRIAL PROCESS PROFILES FOR EN-VIRONMENTAL USE: CHAPTER 13. PLASTI-CIZERS INDUSTRY,
Radian Corp., Austin, TX.
C. M. Thompson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 642, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-023m, 1977. 84 p, 3 fig, 15 ab, 22 ref, 3 append.

Descriptors: *Industrial wastes, *Plastics, *Waste water, *Biochemical oxygen demand, *Suspended olids, Chemical oxygen demand, Copper, Oil, Carbon, Chlorides, Waste water treatment.

The environmental impacts of the plasticizer indus-ry are catalogued including the activities of manu-acturers who produce primary synthetic organic lasticizers. Three process flow sheets and three rocess descriptions characterize the industry. Data are presented on input materials, operating arameters, utility requirements, and waste treams. The synthetic plasticizer processes de-ailed are: esterification of carboxylic acids, pro-luction of phosphate esters by esterification, and poxidation. Waste water is the major environmen-al problem. Waste water from esterification of arboxylic acids can contain dilute caustic, addi-ives, sulfates, and organics such as alcohols, mon-ester, and small amounts of product. A tricresyl-hosphate plant had a higher waste water flow and uch lower loadings for biochemical oxygen emand, chemical oxygen demand, total organic arbon, cyanide, oil, copper, and total dissolved olids, than those for a diethylphthalate plant. Sul-ate loads were comparable for the two processes, nd chloride loads were high for the tricresylphos-hate process. Problems can be avoided with roper waste water treatment. (Small-FRC)
W79-06961

INDUSTRIAL PROCESS PROFILES FOR ENVIRONMENTAL USE: CHAPTER 11. THE SYNTHETIC FIBER INDUSTRY,
Radian Corp., Austin, TX.
J. L. Parr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 481, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-023k, 1977. 56 p, 1 fig, 22 tab, 68 ref, 3 append.

Descriptors: *Textiles, *Industrial wastes, *Waste water, *Solvents, *Lubricants, Sewage, Cooling water, Organic compounds, Waste water treatment, Industrial production.

The environmental impacts of the synthetic fibers industry are examined. Fiber processes are described including: melt spinning, wet spinning, dry spinning, lubrication, drawing, and fiber modifications. Liquid emissions represent the largest potential source of pollutants. These are generally spin-finish wastes and include water used for purging the spinning baths and washing the filaments, lubricants used in finish applications, and solvent wastes from dry and wet spinning. There are also sanitary wastes resulting from the large number of employees, and cooling water blowdown. Waste water emissions are classified according to waste load and treatability. Analysis of samples from a settling pond at an acrylic fibers production facility determined the presence of acrylonitrile (100 mg/liter), 2,8-dibromo-1-propanol (0.5 mgl/liter), an isomer of dibromopropene, and 2,4-dimethyldiphenyl-sulfone. (Small-FRC)

INDUSTRIAL PROCESS PROFILES FOR ENVIRONMENTAL USE: CHAPTER 19. THE CLAY INDUSTRY,
Dow Chemical Co., Freeport, TX.
J. T. Reding, K. E. Bishop, P. E. Muehlberg, and B. P. Shepherd.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 486, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-023s, 1977. 61 p, 3 fig, 6 tab, 29 ref, 3 append.

Descriptors: *Industrial wastes, *Clays, Water pollution sources, *Settling basins, *Suspended solids, Solid wastes, Air pollution, Industrial production, Operations, *Mining.

The environmental impacts of the clay industry are discussed, and industrial processes are described. Clay production and brick manufacture are considered separately. One chemical tree, two process flow sheets, and nine process descriptions characterize the industry. The process descriptions are: mining, crushing, drying, dry grinding, wet concentrating, final drying, extruding, brick drying, and firing. Water pollution is a major environmental problem. As overburden is removed and clay is mined, water percolates through the soil. It becomes high in suspended solids and is usually discharged into nearby streams. A sump or settling basin for the percolating water can solve the problem. Dust emissions are a minor problem. Generated solid wastes are largely used for landfill. In 1973 kaolin clay mining generated approximately 30,000,000 to 40,000,000 metric tons of waste, while common clay mining generated 10,000,000 to 15,000,000 metric tons of waste. (Small-FRC)

INDUSTRIAL PROCESS PROFILES FOR ENVIRONMENTAL USE: CHAPTER 7. ORGANIC DYES AND PIGMENTS INDUSTRY,
Radian Corp., Austin, TX.
T. R. Steadman, E. W. Helper, T. Parsons, G. E. Wilkins, and N. P. Phillips.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 479, Price codes: A16 in paper copy, A01 in microfiche. Report EPA-600/2-77-023g, 1977. 362 p, 76 fig, 7 tab, 5 append.

Descriptors: *Dyes, *Organic compounds, *Pigments, *Industrial production, *Toxicity, Effluent streams, Solid wastes, Air pollution, Brines, Acids, Alkalis(Bases), Color, Metals, Catalysts, Chemical reactions, Waste water disposal, Industrial wastes, Chemical wastes.

Processes associated with the organic dyes and pigments industry are described and their waste streams are characterized. The processes generate solid, liquid, and gaseous wastes. Large volumes of toxic liquid wastes originate from chemical reaction by-products; physical separation techniques such as crystallization, filtration, and washing; and from equipment cleaning methods. The effluent streams are composed of brine solutions and dilute acids and bases contaminated with toxic and/or explosive organic compounds of highly colored dyes or intermediates. Metals or metal salts used as catalysts for various reactions are also present in the waste waters. Specific composition of the effluents is dependent upon the dye or pigment being manufactured. The high cost of treating and controlling these wastes has caused some companies to terminate production of some dyes and pigments. Gaseous emissions generated by this industry include nitrogen oxides, sulfur oxides, hydrogen sulfide, hydrogen chloride, and organic vapors such as amines, phosgene, and formaldehyde. Solid wastes generated include distillation residues, particulates from baghouses, filter paper, and activated carbon. Forty-two chemical trees, 34 process flow sheets, and 48 process descriptions were prepared. Company, product, and raw material data are also included. (Lisk-FRC)

INDUSTRIAL PROCESS PROFILES FOR ENVIRONMENTAL USE: CHAPTER 10. PLASTICS AND RESINS INDUSTRY,
Radian Corp., Austin, TX.
G. F. Wilkins.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 640, Price codes: A15 in paper copy, A01 in microfiche. Report EPA-600/2-77-023j, 1977. 351 p, 22 fig, 121 tab, 84 ref, 3 append.

Descriptors: *Plastics, *Resins, *Chemical wastes, *Industrial production, *Pollutant identification, *Organic compounds, Effluent streams, Air pollution, Cooling towers, Boilers, Solid wastes, Waste water treatment, Industrial wastes.

Processes, operations, and wastes of the plastics and resins industry are detailed. The industry converts monomer or chemical intermediate materials into resinous polymer products. The report includes 20 process flow sheets, and 60 process descriptions incorporating data on input materials, operating parameters, utility requirements, and waste streams. Aqueous waste streams originate from processing streams which are in direct contact with water; from chemical reactions; from cleaning process equipment, area maintenance, utility boilers, and cooling water blowdown; and laboratories. Pollutants found in the waste waters include organic reactants, monomers, oligomers, polymers, and salts. Gaseous emissions are primarily hydrocarbons and specifically, vinyl chloride, toluene disocyanate, phosgene, pyridine, olefins, aromatics, paraffins, and naphthenes. Solid wastes, such as captured particulates and fines, and plastic wastes, are landfilled, incinerated, or recycled. Waste waters produced by cooling towers, refrigeration, and steam generation facilities, may contain toxic anti-corrosion chemicals such as chromium compounds and anti-fouling agents; these effluent streams are usually combined for discharge to treatment plants. INDUSTRIAL PROCESS PROFILES FOR ENVIRONMENTAL USE: CHAPTER 26. TITANIUM INDUSTRY,
Radian Corp., Austin, TX.
V. S. Katari, and T. W. Devitt.
Report EPA-600/2-77-023z, 1977. 65 p, 2 fig, 21 tab, 50 ref, 3 append.

Descriptors: *Titanium, *Industrial production, *Effluent streams, *Mine wastes, *Industrial wastes, Sludge disposal, Acidity, Neutralization, Waste treatment, Sulfur compounds, Operations.

An analysis of the titanium industry producing titanium metal and titanium dioxide is presented. Two industrial process flow sheets and 11 process descriptions incorporating data on input materials, operation parameters, utility requirements, and waste streams were prepared to characterize the titanium industry. The industry generates large quantities from the mining and concentrating of titanium and the production of titanium dioxide. The wastes consist primarily of weak sulfuric acid and their disposal represents a major environmental problem. The wastes are disposed of by sea dumping after neutralization treatment. In 1972, US titanium dioxide plants produced about 1.7 million metric tons of iron-acid sludge and 146 thousand metric tons of iron-chloride sludge. Particulate emissions are also associated with the titanium industry. The mining and beneficiation of ilemenite and the production of titanium dioxide pigment result in emissions. Sulfur dioxide mist, particulate emissions, or chloride emissions are generated by the various calcination processes. (Lisk-FRC)

FATE OF BIOLOGICALLY ACCUMULATED COPPER IN GROWING AND DECOMPOSING THALLI OF TWO BENTHIC RED MARINE ALGAE,
Fundacao Univ. do Rio Grande (Brazil). Base Oceanografica Atlantica.
U. Seeliger, and P. Edwards.
Journal of the Marine Biological Association of the United Kingdom, Vol. 59, No. 1, p 227-238, 1979, 3 fig, 1 tab, 42 ref.

Descriptors: *Environmental effects, *Path of pollutant, Pollutants, Copper, Algae, Absorption, Uptake(Biological), Marine animals, Food chains.

In order to investigate uptake and subsequent release of Cu by both living and decompising thalli, Ceramium pedicellatum and Neogardhiella baileyi were cultured for 30 days in 1.4, 6.4 and 11.4 microg/l Cu in dissolved inorganic form. Concentration factors of Cu found in thalli ranged from 4540 (N. baileyi in 6.4 microg/l) to 6864 (C. pedicellatum in 1.4 microg/l). Up to 22% of the Cu in the thalli was bound to dissolved organic sites during dissolved organic matter (DOM) release while only 3-10% was released in the dissolved inorganic form. After 100 days of degradation, under axenic conditions with no bacterial activity occurring, 80-90% of the Cu was associated with organic dissolved or particulate fractions. It was concluded that the majority of Cu incorporated into the living algal thallus will eventually become available to marine consumers. (Chilton-ORNL)

INDUSTRIAL PROCESS PROFILES FOR ENVIRONMENTAL USE: CHAPTER 6. THE INDUSTRIAL ORGANIC CHEMICALS INDUSTRY,
Research Triangle Inst., Research Triangle Park, NC.
R. Liepins, F. Mixon, C. Hudak, and T. B. Parsons.
Report EPA-600/2-77-0231, 1977. 1014 p, 20 fig, 12 tab, 600 ref, 5 append.

Descriptors: *Environmental effects, *Chemical industry, *Chemical wastes, *Evaluation, *Water pollution sources, Organic compounds, Waste water.

The environmental impacts of the industrial organic chemicals industry are presented. The industry is considered in terms of ten feedstock groups: benzene, butylenes, sources of cresylic acids, ethylene, methane, naphthalene, paraffins, propylene, toluene, and xylene. Ten chemical trees, ten process flow sheets, and 365 process descriptions characterize the industry. Within each process description, available data are presented on function, input materials, operating parameters, utilities, waste streams, EPA Source Classification Code, and references. Company, product, and raw material data are included as appendices. (Small-FRC)
W79-06989

INDUSTRIAL PROCESS PROFILES FOR ENVIRONMENTAL USE: CHAPTER 15. BRINE AND EVAPORITE CHEMICALS INDUSTRY,
Radian Corp., Austin, TX.
P. E. Muehlberg, B. P. Shepherd, J. T. Redding, and H. C. Behrens.
Report EPA-600/2-77-0230, 1977. 324 p, 24 fig, 8 tab, 150 ref, 3 append.

Descriptors: *Environmental effects, *Chemical industry, *Chemical wastes, *Brines, *Inorganic compounds, Water pollution sources, Waste water, Sea water, Saline lakes.

The environmental impacts of the brine and evaporative chemicals industry were evaluated. The industry encompasses all first-level inorganic compounds derived from subterranean brines, from existing or historic salt lakes, and from sea water. Six segments of the industry are discussed: borax and borix acid, chlorine-caustic, lithium chemicals, magnesium chemicals, potash, and sodium metal. The industry is characterized by one chemical tree, 22 process flow sheets, and 67 process descriptions. Within each process description, input materials, operating parameters, utility requirements, and waste streams are described. Company, product, and raw material data are included as appendices. (Small-FRC)

RESULTS OF AN ALGAL TOXICITY TEST APPLIED TO SEDIMENT ELUTRIATES,
Naval Research Lab., Washington, DC.
P. J. Hannan, and C. E. Patouillet.
NRL Memorandum Report 3952, 1979. 24 p, 2 fig, 8 tab, 23 ref.

Descriptors: *Sediments, *Toxicity, *Algae, *Growth rates, *Eluvium, Water pollution, Laboratory tests, Copper.

The effect of sediments from various marine and estuarine sites on the growth rate of the alga, Phaeodactylum tricornutum, was investigated. Cultures were grown in solutions of one part Guillard and Ryther medium and 11 parts sediment elutriate. Algae growth was monitored by fluorescene measurements over a 2-day period. Generally, there was a prolongation of the lag phase of growth, and there were a few cases in which the elutriates were highly toxic. The concentration of the incoulum was a factor in the algae response. With a heavy inoculum (over 30 ppm packed cell volume), a group of sediment elutriates promoted growth, but in the presence of very dilute inocula, these same elutriates provided less growth than the controls. Some sediment elutriates did not reduce the toxicity of sublethal concentrations of Cu(+2), while others did. Also, prolonged storage of sediments at refrigerator temperatures decreased the capacity of certain sediments to reduce the toxicity of Cu(+2) when combined with elutriates. Variations in toxicity were demonstrated in sediments with close proximity to each other in Puerto Misquito Bay, Puerto Rico. (Small-FRC)

5C. Effects Of Pollution

LAKE SUPERIOR ORGANIC CARBON BUDGET,
Minnesota Univ., Minneapolis. Dept. of Civil and Mining Engineering.
W. J. Maier, and W. R. Swain.
Water Research, Vol 12, No 6, p 403-412, 1978. 6 fig, 4 tab, 19 ref. B-139-MINN(1). 14-34-0001-8092.

Descriptors: *Lake Superior, *Great Lakes, *Organic carbon, *Nutrient budgets, *Mathematical models, *Water pollution sources, *Water quality indices, Lakes, Carbon, Total organic carbon, Mass balance, Model studies, Indicators, Nutrients, Photosynthesis, Watersheds(Basins), Rainfall, Sedimentation, Precipitation(Atmospheric), Runoff, Primary productivity, Surface runoff coefficient, Industrialization, Urbanization, Fallout, Air pollution effects.

Analysis of the organic carbon budget for Lake Superior with a simple mathematical model treating the lake as a well-mixed basin shows that watershed runoff, precipitation, and in-situ photosynthetic production are major sources of inflow that could ultimately lead to significant deterioration of water quality. Large yearly inflows of organic matter, whose effect on total organic carbon (TOC) concentration is muted because of dilution in the large lake, could become significant in the long run with persistent small increases which are difficult to verify experimentally. Should industrialization double runoff coefficients, yearly TOC increase would be less than 0.05 mg/l, but lake concentration could reach gross pollution levels (five mg/l) in less than 70 years. Influx of organic matter from watershed drainage is described in this study in terms of surface area and a surface runoff coefficient (SROC) characterized by topographical-hydrological factors and the level of industrial-urban activity. The St. Louis River watershed has the highest SROC (7.5 g/sq m/yr), while undeveloped watersheds have SROCs of 3.4-5.0 g/sq m/yr. TOC influx from the atmosphere as rainfall or dry fallout is probably low (0-3 mg/l) at present, but an increase to 9.4 mg/l (typical of industrial areas) would increase the lake's carbon burden by an amount equal to the tributary runoff associated with an SROC of five gm/sq m/yr. Net yearly accumulation of organic carbon from photosynthetic primary production is undoubtedly small. (Lynch-Wisconsin)

ECOLOGICAL INVESTIGATIONS OF PETROLEUM PRODUCTION PLATFORMS IN THE CENTRAL GULF OF MEXICO - PRELIMINARY FINDINGS,
C. A. Bedinger, Jr.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 4, p 2149-2161, 6 fig, 5 tab, 13 ref, OTC No 3605. Offshore Technology Conference, Dallas, TX 1979.

Descriptors: *Ecology, *Offshore platforms, *Water pollution effects, *Gulf of Mexico, Environmental effects, Oil pollution, *Outer Continental Shelf, Petroleum development.

Southwest Research Institute is presently managing a relatively large program in offshore ecology for the Bureau of Land Management. Project objectives are to assess the long term cumulative effects of production platform operation on the Outer continental shelf (OCS) environment, and further define their 'artificial reef' effect. These results are then to be used in helping formulate future research on the OCE, indicate monitoring techniques and, to review present 'benchmark' studies. The study area covers a broad expanse of the Louisiana 'oilpatch' from the Mississippi delta, west 200 miles and offshore 100 miles. Twenty-four stations have been visited during late spring and late summer, 1978, and winter, 1979, with four platforms sampled as primary sites during each season, 16 as secondary sites in the late summer and four controls in each season. The program was designed to cover all production types, ages and surrounding ecosystems normal to the northcentral Gulf of Mexico. Collections and analyses have included basic hydrography; hydrocarbons in water, sediments and biota; trace metals from similar samples; sediment physical characterization; benthic microbiology; benthic biota; histopathology in fish and invertebrates; and platform associated fouling organisms and fish. This paper presents data from initial sampling and gives observations of trends. The major observations realized are that the Mississippi River overshadows man's activities in affecting the environment in that it overrides ocean water over a considerable area in the nearshore during the summer months causing an oxygen decline and subsequent dieoff and emigration of organisms. (Sinha-OEIS)

AN INDEPENDENT APPRAISAL OF THE OFFSHORE ECOLOGY INVESTIGATION,
M. E. Bender, J. M. Sharp, D. J. Reish, S. G. Appan, and C. H. Ward.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 4, p 2163-2172, 6 fig, 4 tab, 11 ref, Oct No 3606. Offshore Technology Conference, Dallas, TX 1979.

Descriptors: *Monitoring, *Ecology, *Louisiana, *Water pollution effects, *Oil pollution, Environmental effects, Resources development, Baseline studies, Gas, Drilling, *Outer Continental Shelf, Petroleum development, Oil and gas production.

The Offshore Ecology Investigation (OEI) was conducted over a two-year (June 1972 - January 1974) eight-season period in the Timbalier Bay and offshore region of the 'Louisiana Oil Patch'. It consisted of 23 biological, chemical, physical, and geological investigations coordinated in space and time in an effort to detect any cumulative effects on the bay and offshore ecosystems resulting from 35 years of intensive oil and gas drilling and production. The individual Principal Investigators' data, reports, and conclusions were synthesized and interpreted by a four-member Council. During the past year, the logic and rationale employed and the data and conclusions drawn for the OEI were evaluated by three environmental scientists who were not involved in the conduct of the study. The evaluation was conducted using computer-assisted methods which permitted unconstrained and completely selective access to, and display of, all of the OEI data. This paper presents the results of that analysis in terms of (1) the validity and the adequacy of the data to support the 1974 OEI consensus conclusions, (2) the validity of, and basis for, those conclusions, and (3) general recommendations for monitoring methodologies. (Sinha-OEIS)

THE MIXING OF OIL SPILLS INTO THE SEA BY BREAKING WAVES,
A. Naess.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 4, p 2193-2204, 11 fig, 2 tab, 9 ref, OCT No 3610. Offshore Technology Conference, Dallas, TX 1979.

Descriptors: *Oil spills, *Waves(Water), *Mixing, *Model studies, Resources development, Environmental effects, Water pollution effects, Baseline studies, *Outer Continental Shelf, Petroleum development.

A problem of considerable importance to pollution control out on the high seas is the mixing of an oil spill into the sea caused by breaking waves. In this paper a theoretical model is proposed that represents a fruitful approach to the problem of determining the amount of oil mixed into the sea by breaking waves. The model is based primarily on probabilistic methods, but with experimental observations and data as an essential foundation. In order to illustrate the theoretical model, some numerical examples are given. (Sinha-OEIS)
W79-06525

SOME CAUSES, CONSEQUENCES AND POTENTIAL ENVIRONMENTAL IMPACTS OF OXYGEN DEPLETION IN THE NORTHERN GULF OF MEXICO,
N. Fotheringham, and G. H. Weissberg.
In: Proceedings of Eleventh Annual Offshore Technology Conference, held Houston, TX, April 30-May 3, 1979. Volume 4, p 2205-2208, 4 fig, 1 tab, 2 ref, OTC No 3611. Offshore Technology Conference, Dallas, TX 1979.

Descriptors: *Water quality, *Water pollution effects, *Gulf of Mexico, Oil pollution, Waste disposal, Mortality, Benthos, Environmental effects, Resources development, Baseline studies, *Outer Continental Shelf, *Oxygen depletion, Ocean dumping.

Biological and water quality changes in the Gulf of Mexico off the central Louisiana coast have been examined during a seasonal period of stratification and oxygen depletion in the water column. Probable causes, observed effects, and potential impacts on the timing of ocean discharges and dumping and onsite selection for offshore industries are described. Apparently an annual phenomenon of variable intensity resulting from a large discharge of low salinity, organic-laden water from the Mississippi and Atchafalaya Rivers at a time of minimal vertical mixing, this midsummer event may be intensified and prolonged by the intrusion of high salinity bottom water from a Loop Current eddy. In 1978, a widespread low oxygen layer occupied the lower 3 to 8 m of the 6 to 17 m water column for at least 3 weeks. Dissolved oxygen concentration was commonly less than 0.1 ppm in this layer, resulting in the mortality of some polychaetes, mollusks, and crustaceans, including blue crabs, and in the reduction of demersal shrimp and fish populations, probably through emigration offshore. Numerous large bivalves approximately 4 to 5 years old were killed, indicating an intensity not experienced since 1973 to 1974, when Green found anoxic bottom water at over one-half of his stations in this area. The temporal and geographic distribution of this condition and its environmental consequences should be recognized by industries engaged in fishing, offshore petroleum production, and offshore dumping and by government agencies providing leases and permits for these activities. TEMPERATURE TOLERANCE OF LARVAL MUSKELLUNGE (ESOX MASQUINONGY MITCHELL) AND F1 HYBRIDS REARED UNDER HATCHERY CONDITIONS,
State Univ. of New York Coll. at Buffalo. Dept. of Biology.
J. D. Bonin, and J. R. Spotila.
Comparative Biochemistry and Physiology, Vol. 59A, No. 3, p 245-248, 1978, 2 fig, 31 ref. ERDA E(11-1)-2502.

Descriptors: *Environmental effects, *Temperature, *Resistance, Fry, Larval growth stage, Fish, Pikes, *Critical thermal maxima.

Muskellunge and norlunge fry were acclimated to as close to natural conditions as possible in lake water with natural diets and photoperiod. Temperature tolerances of the fry were determined during a 53 day period beginning the day after hatching and ending when fry were released to Chautauqua Lake. There was a highly significant difference between the average critical thermal maxima (CTM) of norlunge (34.0C) and muskellunge (32.8C) fry. Both fish exhibited a marked decrease in CTM during swim-up indicating that this is a critical period of development. After swim-up the temperature tolerance of muskellunge fry gradually increased. CTM of norlunge fry followed the same pattern but were higher than those of muskellunge fry. CTM increased in both fry regardless of water temperature. Norlung fry adjusted to changing environmental conditions more readily than muskellunge fry. (Chilton-ORNL)

EFFECTS OF THERMAL LOADING ON BOTTOM INVERTEBRATES IN A SOUTH CAROLINA RESERVOIR,
Clemson Univ., SC. Dept. of Zoology.
C. F. Sigmon.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 404, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Institute, Clemson University, Completion Report No. 76, April 1979. 40 p, 5 fig, 7 tab, 35 ref. OWRT B-086-SC (1).

Descriptors: *Benthos, *Heated water, *Water pollution, *Density, *Distribution, *Water pollution effects, Benthic flora, Benthic fauna, Aquatic life, Nuclear reactors, Nuclear powerplants, Temperature, Sampling, Oconee Nuclear Station, Lake Keowe(South Carolina).

The influence of season, depth, station location, water temperature and sediment characteristics on benthos were studied in an investigation of the

effects of operation of the Oconee Nuclear Station in Lake Keowee, South Carolina. The study period, 1971-1976, includes a two year time prior to the start-up of the Station's three 886 megawatt reactors during 1973 and 1974, and the years of intermittant operation of all three reactors. Sediment samples taken at one and 10 m depths at the four stations were analyzed for particle size distribution, benthic samples were collected monthly at the stations, and temperature data was obtained from monitors operated at each station by Duke Power Company. The results include data on species composition, density and headwidths of benthos. During the study period, diversity and density were lower in the discharge canal. Both were caused by reduced organic content of the discharge canal sediments. Temperature did not affect density or diversity, and subtle effect of temperature on growth were not observed. It is concluded that the distribution of those benthos studied is more strongly influenced by sediment characteristics than by temperature. The hypolimnetic intake design aids in minimizing the effects of the thermal effluent on the benthos. The thermal character of the discharge canal does not differ much from that of the epilimnion of the other stations. (Davison-IPA)
W79-06561

KEPONE/MIREX/ HEXACHLOROCYCLOPENTADIENE: AN ENVIRONMENTAL ASSESSMENT.
National Research Council, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 289, Price codes: A05 in paper copy, A01 in microfiche. 1978. 84 p, 2 fig, 9 tab, 100 ref. 68-01-3253.

Descriptors: *Pesticides, *Organic pesticides, *Chlorinated hydrocarbons, *Kepone, *Mirex, *Hexachlorocyclopentadiene, *Environmental effects, Toxicity, Pesticide residues, Chemical wastes, Biochemistry, Animal growth, Marine biology, Aquatic animals, Fish, Human pathology, Soil contamination effects, Water pollution effects, Water pollution sources.

Literature searches conducted by Battelle Columbus Laboratories and the Stanford Research Institute served as a basis for the assessment of the scientific and technical knowledge on the effects of Kepone, mirex and hex as environmental pollutants. Focusing primarily of effects, this study only considers those aspects of transport, transformation, and routes of exposure critical to specific organisms and/or systems. The cyclodiene insecticides Kepone and mirex are synthesized from hexachlorocyclopentadiene (hex). As members of the organochlorine group, Kepone and mirex are generally similar in regard to their chemical characteristics, biological activity, and behavior in the environment. Kepone is environmentally persistent and highly toxic to various organisms. Since it is carcinogenic to laboratory rodents, it is presumed to present a cancer hazard to humans. Mirex has a tendency to bioaccumulate and biomagnify; it degrades into a series of potentially hazardous products including Kepone. It is toxic to human beings, and carcinogenic to laboratory rodents. Hex undergoes bioconcentration and biomagnification in simulated microcosms, thus showing environmental characteristics common to some better known organochlorine compounds. Production is expected to remain at high levels for the manufacture of flame retardants and pesticides for export. The list of research needs identifies where more knowledge is needed to make a truly comprehensive assessment of the effects of these insecticides. (Davison-IPA)
W79-06566

CONTAMINANTS ASSOCIATED WITH DIRECT AND INDIRECT REUSE OF MUNICIPAL WASTEWATER.
SCS Engineers, Long Beach, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 482, Price codes: A16 in paper copy, A01 in microfiche. Report No EPA-600/1-78-019, March 1978. 360 p, 4 fig, 113 tab, 716 ref. 68-02-2257.

Descriptors: *Waste water, *Water reuse, *Public health, *Path of pollutants, *Waste water treatment, *Wastes, *Cities, *Waste water disposal, Tertiary treatment, Coagulation, Disinfection, Carbon, Adsorption, Ion exchange, Reverse osmosis, Filtration, Potable water.

A compilation of the available published quantitative data concerning the health effects associated with the reuse of treated municipal waste water is presented. The information includes data on the effectiveness of conventional water and waste water treatment and disposal operations to reduce concentrations of public health contaminants and the transport of these contaminants through the environment to man. The data are organized so that the pollutant paths to man can be evaluated according to public health significance to establish research priorities. Conventional secondary and tertiary waste water treatment processes, and the disposal techniques, direct discharge to fresh surface waters and land application, are evaluated. The water treatment processes evaluated include the conventional treatments, chemical coagulation, with or without filtration, and disinfection, and the advanced water treatments, carbon adsorption, ion exchange and reverse osmosis. Public health considerations are discussed. (Davison-IPA)

THE IMPACT OF BROADLY APPLIED EFFLUENT PHOSPHORUS STANDARDS ON EUTROPHICATION CONTROL,
Corvallis Environmental Research Lab., OR.
J. H. Gakstatter, A. F. Bartsch, and C. A. Callahan.
Water Resources Research, Vol 14, No 6, p 1155-1158, December, 1978. 1 fig, 18 ref.

Descriptors: *Eutrophication, Sewage effluents, Effluents, *Phosphorus, Municipal wastes, Sewage disposal, Model studies, Trophic level.

The potential trophic benefits to lakes and reservoirs of a 1 mg/l and zero-discharge total phosphorus effluent standard for municipal sewage treatment plants were examined by using two phosphorus mass balance models. The analysis included 255 lakes and reservoirs receiving municipal sewage treatment plant effluents and located in the eastern half of the United States. These water bodies, their significant tributaries, and contributing effluents were sampled during the U.S. Environmental Protection Agency's National Eutrophication Survey. Improvement in trophic condition is defined as a predicted decrease of at least 25% in external phosphorus supply, which would cause the predicted in-lake total phosphorus concentration to (1) decrease from greater to less than 40 micrograms/liter but remain above 20 micrograms/liter, (2) decrease from above 20 micrograms/liter to less than 20 micrograms/liter, or (3) decrease from less than 20 micrograms/liter to a lower concentration. Using the definition stated above, the two models indicated that 18-22% of the water bodies would benefit from a 1 mg/l effluent standard. If the requirement were zero phosphorus, 28% of the water bodies would benefit. (Skogerboe-Colorado State)

OCEAN DISPERSAL AS AN ULTIMATE DISPOSAL METHOD,
Philadelphia Water Dept., PA. Water Pollution Control Div.
C. F. Guarino, M. D. Nelson, and S. S. Almeida.
Journal Water Pollution Control Federation, Vol. 51, No. 4, p 773-782, April 1979. 3 fig, 11 tab, 4 ref.

Descriptors: *Waste disposal, *Water pollution effects, *Environmental effects, Sludge disposal, United States, Dispersion, Heavy metals, Bacteria, Polychlorinated biphenyls, *Outer Continental Shelf, *Ocean dumping, *Brazil.

The use of ocean dispersal as an ultimate disposal method for wastewater sludges will end in the United States by 1981. Ocean disposal of sludge has come under attach in the United States from both the professional as well as the layman. Most often, concern is focused on physical changes associated with dumping, such as: degradation of recreational waters, sea bottom build-up, and toxicity to marine life. Yet many researchers have also studied effects that are not quite as obvious: heavy metal concentration in sediments, bacteria in shellfish, and polychlorinated biphenyl (PCB) accumulation. Rio de Janeiro, the major metropolitan area in Brazil, presently discharges almost 65% of its collected wastewater flow directly to the ocean via outfall. Plans are being made, however to treat this flow and of course, dispose of the resulting sludge. In evaluating possible sludge disposal methods, Brazilian engineers have not eliminated ocean disposal. By studying the experience and data developed for the ocean disposal operation used by Philadelphia, Brazilian engineers are evaluating the advantages and disadvantages of ocean use against other possible systems. The results are not yet in but preliminary indications show ocean disposal to be sound sludge management strategy. This report outlines the environmental impact aspects of such an evaluation. The data that have been assembled are largely a result of monitoring efforts carried out at Philadelphia's offshore disposal site by EPA. (Sinha OEIS)

TRANSIENT EFFECTS OF OCEAN WASTEWATER SLUDGE DUMPING,
National Marine Fisheries Service, Highlands, NJ. Sandy Hook Sport Fisheries Marine Lab.
A. F. J. Draxler.
Journal Water Pollution Control Federation, Vol 51, No 4, p 741-748, April 1979. 5 fig, 18 ref.

Descriptors: *Waste water disposal, *Water pollution effects, *Environmental effects, Sludge disposal, New York, Nutrients, Settling velocity, *Outer Continental Shelf, New York Bight, Ocean dumping.

Wastewater sludge from the New York metropolitan area is barged to a site approximately 22-km equidistant between Long Island, New York and Sandy Hook, New Jersey where it is dumped in water 29-m deep. The sludge contains approximately 5% solids, which are 55% organic material, and has a large nutrient and heavy metal content. The spatial and seasonal distribution of nutrients in the water and metals in the sediment of the Bight and the distribution of ammonium nitrogen by waste dumping have both been previously investigated. In contrast to those studies, the purpose of these experiments was to investigate the dynamic processes that follow a single sludge dump: the settling of particulates, the dilution of nutrients, and the changes in oxygen concentration of the receiving water. (Sinha-OEIS)

EFFECTS OF OILFIELD BRINE EFFLUENT ON SEDIMENTS AND BENTHIC ORGANISMS IN TRINITY BAY, TEXAS,
Texas A and M University, College Station. Dept. of Biology.
H. W. Armstrong, K. Fucik, J. W. Anderson, and J. M. Neff.
Marine Environmental Research, Vol. 2, No. 1, p 55-69, January 1979. 3 fig, 2 tab, 34 ref.

Descriptors: *Sediments, *Benthos, *Brines, *Water pollution effects, *Environmental effects, Outfall sewers, Oil pollution, Texas, Resources development, *Outer Continental Shelf, Naphthalenes, Hydrocarbons, Petroleum development, Trinity Bay(TX).

Field studies have established the concentrations of naphthalenes in bay sediments and water in the vicinity of an oil separator platform and their effects on the benthic fauna. Fifteen stations were occupied monthly, from July, 1974 to December, 1975, along three transects extending from the separator platform outfall outwards for a distance of 4.0 to 5.6 km. A lesser number of stations were occupied from April, 1974 to June, 1974. Bottom sediments at each station were analysed for total haphthalenes content and for number of species and individuals. All stations were located in 2 to 3

of water. The outfall was located 1 m off the ay bottom. There was a definite correlation be- veen sediment naphthalenes concentrations and umber of species and individuals. The bay bottom as almost completely devoid of organisms within 5 m of the effluent outfall. Stations located 150 m om the outfall had severely depressed 455 m om the platform were unaffected. Trinity Bay, exas, the site of this investigation, has a mean epth of 2.5 m. The bay water is highly turbid due the presence of a high concentration of clay- zed particulate material. The brine outfall was cated approximately 1 m above the bay bottom. hese special conditions undoubtedly contributed gnificantly to the observed impact of the brine. herefore, extrapolations from the results of this udy to offshore oil production and brine disposal ould be made with extreme caution. FFECTS OF PRUDHOE BAY CRUDE OIL ON RIMARY PRODUCTION AND ZOOPLANK- ON IN ARCTIC TRUNDRA THAW PONDS,
incinnati Univ., OH. Dept. of Biological Sci- nces.
. W. Federle, J. R. Vestal, G. R. Hater, and M. . Miller.
larine Environmental Research, Vol. 2, No. 1, p -18, January 1979. 8 fig, 2 tab, 17 ref.

Descriptors: *Oil pollution, *Zooplankton, *Phy- oplankton, *Primary productivity, *Water pollu- on effects, Alaska, Tundra, Environmental effect, Resources development, *Outer Continental Shelf, rudhoe Bay(AK), Petroleum development, Oil ransport.

The effects of Prudhoe Bay, Alaska, Crude oil on he indigenous phytoplankton and zooplankton of undra thaw ponds were studied under controlled onditions in sity during the summer of 1976. These effects were compared with uncontrolled oil pills on Pond Omega (a year previously) and Pond E (six years previously). In the uncontrolled pills, the phytoplankton species composition of oth ponds remained appreciably different com- ared with control Pond C, although phytoplank- on biomass did not differ greatly. Primary produc- ion remained low in Pond Omega but had recov- red to control levels in Pond E. In controlled ubpond experiments, oil caused a decrease of bout 90-100% in primary production in five days ut recovered to 40-50% of the control level vithin fifteen days. During that time, phytoplank- on biomass decreased initially but recovered vithin fifteen days. Oil caused a shift in phyto- lankton species composition from a predominance f cryptophytes to chrysophytes. Subponds con- aining two Daphnia middendorffiana and one Bra- hinecta paludosa per litre of pondwater were also ffected by oil, causing zooplankton death within hree or four days. After tht time, changes in the hytoplankton species composition were similar to control subponds without zooplankton. Oil toxicity o zooplankton or experimental removal resulted in loss of grazing pressure which caused the elimi- nation of the cryptophyte Rhodomonas sp. This pecies was still absent from Pond Omega, but was een in Pond E for the first time, when zooplank- on also re appeared after six years. Oil perturba- ion of tundra thaw ponds causes a loss of zoo- lankton and a reduction in primary production. Phytoplankton primary production recovers some- what but algal species composition remains hanged because of the loss of zooplankton grazing ressure and the selective effects of oil. (Sinha-OEIS)

OIL, FISHERIES, AND THE HEALTH OF THE ECOSYSTEM: A REVIEW,
National Marine Fisheries Service, Woods Hole, MA. Northeast Fisheries Center.
K. Sherman, and J. B. Pearce.
In: Marine Studies of San Pedro Bay, California. Part 15, p 240-258, December 1978. 3 tab, 33 ref.

Descriptors: *Oil pollution, *Water pollution ef- fects, *Oil spills, *Environmental effects, Fisheries, Ecosystems, Resources development, *Outer Continental Shelf, Petroleum hydrocarbons.

An overview of the effects of petroleum hydrocarbons in the marine environment on fisheries and on ecosystems is presented. Assessments of damage from major spills are reviewed. Each year 6 million metric tons of petroleum hydrocarbons enter the ocean. Of this amount 1% is attributable to offshore production, 44% is introduced from municipal and industrial wastes and river and urban runoff, 35% from transport and offloading operations, and 20% from natural seeps and atmospheric fallout. Measured against this total, an acute tanker spill represents a relatively small percentage of annual input. The Argo Merchant spill, while spectacular, represented 1% of the total annual input of oil in the marine environment. Oil is a complex mixture of hydrocarbons. Its toxicity to marine organisms is roughly proportional to its aromatic content. Greatest damage from a spill of petroleum hydrocarbons in a shallow nearshore environment results from the mixing of petroleum hydrocarbons in the water column, and subsequent penetration in the sediments. This action increases the residence time of the oil. (Sinha-OEIS)

GROUND-WATER CONTAMINATION BY FERTILIZER NITROGEN,
Science and Education Administration, Fort Collins, CO.
H. R. Duke, D. E. Smika, and D. F. Heermann.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol. 104, No. IR3, p 283-291, September 1978. 6 fig, 2 tab, 8 ref.

Descriptors: *Irrigation, *Groundwater, *Water quality, *Sprinklers, Aquifers, Nitrogen, Agriculture, Percolation, Water table, Water samples, Deep soil cores.

Nitrogen percolation beneath the crop root zone was significantly reduced by careful irrigation management using the USDA irrigation scheduling program. Deep percolation losses were measured directly using vacuum extractors. Analyses of both deep soil cores and water samples from piezometers suggest that significant amounts of percolating nitrate are removed by denitrification, either before or soon after reaching the water table, thus reducing the potential for groundwater contamination. VARIATION IN THE CHEMICAL COMPOSITION OF FRESHWATER FISH,
Auburn Univ., AL. Dept. of Fisheries and Allied Aquacultures.
J. A. Davis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-295 810, Price codes: A04 in paper copy, A01 in microfiche. Ph.D. Dissertation, Aquacultures, 1978, 58 p, 2 fig, 13 tab, 38 ref. OWRT A-066-ALA (1), 14-34-0001-8001.

Descriptors: Chemical composition, *Freshwater fish, Calcium, Magnesium, Sodium manganese, Phosphorus, Zinc, Copper, Ash, Oxygen, Lepomis macrochirus.

Three possible sources of variation in the chemical composition of freshwater fish were explored. These were (1) intersite variation of elements in fish and its relationship to the concentrations of the elements in the water from which they were taken, (2) intraspecific variation with respect to size of the fish, and (3) interspecific variation of chemical composition among species. Fish were collected from lentic waters representing widely varying water qualities to determine if concentrations of elements in water significantly affect their chemical composition. Statistical analyses indicated no significant relationships existed between Ca, Mg, Na, K, N, S, P, Zn and Cu concentrations in fish and the waters from which they were taken. This low correlation is probably due to homeostatic control of these elements by fish. Analyses of two size series of Lepomis macrochirus indicated positive correlations with length and concentrations of Ca, Na, P, Mn and ash. Negative correlations were shown for total-N, K, S and Zn concentrations and length. Eighteen species of freshwater fish were analyzed to determine variation among fish species. Ca, Mg, Na, Mn, P, Zn, Cu, ash and oxygen consumed demonstrated the greatest variation among species. Generally greatest variation was found among species and least variation was found among sizes.

ATTITUDES OF NEARBY RESIDENTS TOWARD ESTABLISHING SANITARY LANDFILLS,
Economics, Statistics, and Cooperative Services, Washington, DC.
D. T. Massey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-278 905, Price codes: A04 in paper copy, A01 in microfiche. Final Report No ESCS-03, 1974. 65 p, 33 tab, 4 append.

Descriptors: *Landfills, *Attitudes, *Land use, *Wastes, *Water pollution, *Water pollution sources, Waste disposal, Waste treatment, Environmental engineering, Environmental sanitation, Air pollution, Land development, Land reclamation, Effluents, Social values.

The attitudes of citizens in four survey areas concerning proposed or newly established landfills are analyzed in relation to factors that may influence those attitudes, and the major factors influencing the decision to oppose or favor a landfill's establishment are identified. Resident opposition to the establishment of sanitary landfills in nearby areas is largely due to the possibilities of water pollution, insects and rodents, odors, and blowing papers from the site. It is felt that these factors would be detrimental to property values. Public support of landfills was also discouraged by the use of land better suited for agriculture and heavy truck traffic on local roads. Most residents surveyed felt that landfills should be located at least 1 mile from residences and that landfills should be in operation less than 5 years. Promises concerning improved collection and disposal service, free access to the site, and development of the site as a future park or recreation area had little influence on those opposing or favoring the landfill. ENERGY ANALYSIS OF REGIONAL WATER POLLUTION CONTROL,
Oregon State Univ., Corvallis.
R. J. Heggen, and K. J. Williamson.
Journal of the Water Pollution Control Federation, Vol. 51, No. 4, p 759-772, April 1979. 10 fig, 7 tab, 7 equ, 8 ref.

Descriptors: *Water pollution control, *Input-output analysis, *Methodology, *Energy, *Alternative planning, *Costs, Regional development, Effects, Dissolved oxygen, Rivers, Environmental control, Runoff, Flow augmentation, Cost allocation, Waste water treatment, Multiple-purpose reservoirs, Benefits, Evaluation, Mathematical models, Systems analysis, Equations, Willamette River(Oregon).

Two strategic approaches to water quality control in Oregon's Willamette River are presently being utilized: point source treatment and flow augmentation from reservoirs. Input-output analysis provides an econometric methodology to study direct and indirect response to pollution control alternatives. An energy input-output national model is coupled with a comprehensive Willamette River dissolved oxygen model. Alternatives of environmental control are evaluated as if they had been practiced in a study year of low natural runoff. The relation of augmentation for water quality to other river uses is used to value flow in a benefits-foregone manner. Independently, reservoir costs are allocated to water quality. For alternatives of treatment and augmentation, river quality, dollar cost and energy impact response surfaces are developed. Energy and dollar-efficient management call for the full role of augmentation in water quality control. (Bell Graf-Cornell)

OPERATORS PRESENT TESTIMONY IN DEFENSE OF PLAYA LAKE DISPOSAL,
J. Brewster.
Drill Bit, Vol. 28, No. 4, p 26-27, April, 1979.

Descriptors: *Playas, *Brine disposal, *Environmental effects, Waterfowl, Wading birds, Water pollution, Groundwater, Water pollution sources.

Key points underlying the controversy concerning environmental effects of brine disposal in playa lakes of west Texas are discussed. Disposal is confined to five lakes with a total area of over 7,000 acres. The number of bird kills due to oil and salt is disputable. The salinity of the lakes is higher than the brines due to rates of inflow and evaporation. The charge that brine disposal may contaminate ground water is unfounded since the aquifers in West Texas are situated above the playa lakes. Contamination would result only from heavy rains that would raise the level of the lake and reverse the flow of groundwater into the aquifer. (Purdin-NWWA)

BIOLOGICAL AND MICROBIOLOGICAL ASSESSMENT OF THE UPPER CHATTAHOOCHEE RIVER BASIN, GEORGIA,
Geological Survey, Doraville, GA. Water Resources Div.
B. W. Lium, J. K. Stamer, T. A. Ehlke, R. E. Faye, and R. N. Cherry.
Available from Branch of Distribution, USGS 1200 S. Eads St. Arlington, VA 22202. Geological Survey Circular 796, 1979. 22 p, 22 fig, 5 tab, 16 ref.

Descriptors: *Algae, *Phytoplankton, *Nutrients, *Rivers, *Lakes, Eutrophication, Streamflow, Effluents, Waste water disposal, Dissolved oxygen, Low flow, Nitrification, Diatoms, Microorganisms, Georgia, *Upper Chattahoochee River basin, *West Point Lake(Ga).

Biological and microbiological studies were conducted by the U.S. Geological Survey as a part of the Intensive River-Quality Assessment studies of the upper Chattahoochee River basin, Georgia. Phytoplankton concentrations in cells per milliliter (cells/mL) were generally higher downstream from Atlanta than upstream. The highest concentrations, mostly blue-green algae, occurred in West Point Lake with an average of 90,000 cells/mL for the sampling period. The lowest concentrations, 1,000 cells/mL, occurred upstream of Lake Sidney Lanier. Dissolved orthophosphate and nitrite plus nitrate concentrations were highest in the river reaches and upper reaches of the two lakes and were lowest at the dam pools of both lakes. The high nitrite plus nitrate concentrations downstream from Atlanta were primarily a result of nitrification by Nitrosomonas and Nitrobacter bacteria. Algal growth potential was highest downstream from Atlanta, 25 milligrams per liter (mg/L) at Whitesburg, and was the lowest in the headwaters and at the dam pools of Lake Sidney Lanier and West Point Lake. The rate of nitrification in the Atlanta to Franklin reach of the river was comparatively low, 0.02 mg/L per hour. Nitrification was an important cause of dissolved-oxygen consumption in a 45-mi reach of the river downstream from the Atlanta wastewater treatment facilities. Dissolved-oxygen consumption as a result of nitrification may be greatest during low flow. (Woodard-USGS)

IMPACT OF COPPER MINING ON A DESERT INTERMITTENT STREAM IN CENTRAL ARIZONA: A SUMMARY,
Arizona State Univ., Tempe. Dept. of Zoology.
M. A. Lewis, and R. Burraychak.
Journal of the Arizona-Nevada Academy of Science, Vol. 14, No. 1, p 22-29, Feb. 1979, 3 fig, 2 tab, 33 ref.

Descriptors: *Mine water, *Mine wastes, *Environmental effects, *Aquatic habitats, *Pollutant identification, Sedimentation, Primary productivity, Mining, Water quality, Ephemeral streams, Water chemistry, Aquatic environments, Fish populations, Suspended solids, Hydrobiology, Microbial degradation, Biota, Water pollution, Heavy metals, Arizona, Diel migration.

The present report summarizes the results of a 2 year study conducted at the Pinto Valley Mine at Pinto Creek in the Tonto National Forest, Gila County, Arizona, to determine the detrimental impact of a large mine on biotic survival in a small desert stream. Water chemistry of Pinto Creek was monitored bi-weekly during 1975-1976 at 4 stations, one above and three below the discharge points, by Tonto National Forest service personnel following standard procedure. Primary production for 2 stream areas was estimated from analysis of diel changes in dissolved oxygen. Surveys of fish, aquatic macroinvertebrates, and vegetation were conducted during 1975-1976 at 13 sampling stations along the total length of the stream. Results clearly indicated the hazards of mining to the stream biota with sedimentation having the primary detrimental effect by elimination of much of the biota, reduction of primary production, and alteration of normal habitat. Unlike suspended solids, however, heavy metals entering the stream were found to be sufficiently diluted to non-toxic levels. Although the quantity and quality of the biota were not as yet noticeably affected 10 km downstream from the discharge channels, sediment encroachment is expected to cause a reduction in primary production both as a direct source of food and as a primary source of energy. FISH TOXICITY EVALUATION OF EFFLUENTS FROM AN ORGANIC CHEMICAL PRODUCTION COMPLEX, BASF, GERMANY,
Department of Fisheries and Environment, Ottawa (Ontario). Wastewater Technology Centre.
V. W. Cairns, K. Conn, B. E. Jank, and U. Pagga.
Technology Development Report EPS 4-WP-79-3, February 1979, 58 p, 10 fig, 9 tab, 4 app.

Descriptors: *Fish, *Toxicity, *Effluents, *Organic wastes, *Chemical wastes, Waste water treatment, Chemical analysis, Pollutants, Temperature.

BASF Aktiengesellschaft of the Federal Republic of Germany and the Environmental Protection Service, Canada cooperated in a study to assess the toxicity reduction capability of the wastewater treatment system for the BASF plant at Ludwigshafen, Federal Republic of West Germany. Information obtained was to be used for assessment of best practicable technology for the Canadian organic chemical industry as part of Environment Canada's program of developing regulations and guidelines governing discharge of pollutants. A preliminary program, Phase 1, carried out by BASF, determined that no change in acute toxicity or chemical composition occurred in wastewaters subjected to 48-hour, non-refrigerated storage. For Phase 2 of the operation, eight-hour composite samples of raw wastewater, primary settled effluent and activated sludge plant effluent were collected by BASF personnel and shipped by air to the Wastewater Technology Centre, Burlington, Ontario for toxicity testing. A total of 18 samples were shipped over a period of four weeks. Bioassays and chemical analyses were carried out on the samples both as received and after removal of ammonia using clinoptilolite. All samples exhibited lethality to rainbow trout and although ammonia removal was not complete in all cases, results suggested that a significant portion of the toxicity in the samples could not be attributed to ammonia. After comparing analytical data with long term performance data, it was concluded that bioassay results are representative of what could be expected during long term operation of the treatment system. Descriptors: *Environmental effects, *Stress, Thermal stress, Temperature, Salinity, Food abundance, Mussels, Reproduction, Animal physiology.

Groups of mussels were exposed to varying temperature, salinity and food conditions. Measurements of the energy status of individuals was used to assess the physiological condition of adults. As a result of stress to adults, resorption of some ripe gametes occurred as well as lysosomal destabilization in the both the digestive cells and the Leydig cells. Mussels under stress produced fewer and smaller eggs, in smaller follicles, than those not under stress. Eggs from stressed females contained less lipid and protein than eggs from unstressed females. The importance of these physiological relationships in understanding environmental impact on ecological fitness is pointed out. (Chilton-ORNL)

Descriptors: *Bibliographies, *Publications, *Environmental effects, *Aquatic environment, *Metals, Toxicity, Behavior, Animal growth, Plant growth, Reproduction, Retention, Salt balance, Documentation.

A total of 954 journal articles and laboratory and field investigation reports are listed on toxicological, physiological and metabolic effects of stable and radioactive species of heavy metals and other cations to aquatic life. Each reference is annotated and indexed by metal, by taxon and by author. Most references listed were published between 1971 and 1976, but a large minority, in print for sometime, have only recently become available. The selected articles emphasize the following response parameters: survival; growth; reproduction; behavior; bioaccumulation; retention; translocation; histopathology; baseline data on elemental composition; changes in exogenous salt content on responses including internal changes in salt balance of body fluids and tissues; interaction effects of metals and their salts in combination with other substances; and modifying effects of biotic and abiotic factors on all parameters examined. Three cumulative indices encompassing this volume and two preceding volumes are presented: Index-Metals, Index-Taxa, and Index-Authors. (Davison-IPA)

TEMPERATURE EFFECTS ON THE INCORPORATION OF SIALIC ACID INTO GANGLIOSIDES AND GLYCOPROTEINS OF FISH BRAIN,
Stuttgart Univ. (Germany, F.R.). Zoologisches Inst.
H. Rosner, H. Breer, R. Hilbig, and H. Rahmann.
Journal of Thermal Biology, Vol. 4, p 69-73, 1979, 2 fig, 1 tab, 27 ref.

Descriptors: *Environmental effects, *Temperature, Fish, Physiology, Seasonal, Central nervous system.

The influence of temperature changes on the incorporation of sialic acid into brain gangliosides and sialoglycoproteins in fish was investigated following intracranial injections of the specific precursor N-(H3) acetylmannosamine. The data show that radioactive in vivo labelling of brain gangliosides and sialoglycoproteins by application of N-(H3) acetylmannosamine is much more temperature-sensitive than the radioactive labelling of brain proteins by means of (H3) leucine. Brain gangliosides were labelled 4-5 times more heavily at 20 C as compared to 7 C, whereas sialoglycoproteins are labelled only 2-3 times as much. Renewal of gangliosides in the nerve endings of the optic tract was negligible at 7 C. It was concluded that at lower environmental temperatures the turnover of multisialogangliosides is diminished to a larger extent than that of oligosialogangliosides. These differentiated temperature effects may be the reason for seasonal changes in the brain ganglioside pattern observed in goldfish, carp and rainbow trout. (Chilton-ORNL)

THE HEALTH EFFECTS OF GROUND WATER RECHARGE. PART I,
National Water Well Association, Worthington, OH.
T. E. Gass.
Water Well Journal, Vol. 33, No. 4, p 34-35, April, 1979.

Descriptors: *Artificial recharge, *Waste water pollution, *Water reuse, Groundwater, Water quality, Pollutants, Bacteria, Viruses, Inorganic compounds, Organic compounds, Trace elements, Toxicity, Recycling.

The potential health effects resulting from the use of surplus wastewater for artificial ground water recharge are discussed. The quality and chemical composition of such wastewater and excess surface runoff must be carefully examined and controlled to avoid long-term contamination of aquifers. Contaminating agents are either biological or chemical. Giardiasis is a common bacteria found in contaminated drinking water which causes an intestinal disease. Viruses, such as hepatitis are extremely difficult to monitor but have been clearly traced to sewage-contaminated water. Arsenic and Barium are two potentially toxic inorganic compounds found in water. Unlike inorganic chemicals, the presence of even trace amounts of organic chemicals in treated, reclaimed water is of great concern. The long-term effects of low doses of potentially toxic compound in water is not known. (See also W79-06896) (Purdin-NWWA)

WATERBORNE DISEASE - CURRENT THREAT,
California Univ., Berkeley. School of Public Health.
R. C. Cooper.
Ground Water, Vol. 17, No. 2, p 192-196, March-April, 1979. 2 tab, 24 ref.

Descriptors: *Water quality, *Diseases, *Water treatment, Organic compounds, Trace elements, Hardness(Water), Asbestos, Water sources, Potable water, Groundwater.

Modern water treatment technology can reduce the number of known pathogens to acceptable levels. Certainty of such control depends upon treatment plant reliability and integrity of water distribution lines. Water supplies that meet bacterial standards may still transmit viruses. Soft water has been associated with a higher incidence of cardiovascular disease, infant mortality, and spina bifida. Asbestos has been suspected as a possible contributor to the incidence of cancer. The public health implications of the presence of trace amounts of organic compounds in water is uncertain due to the chronic nature of diseases suspected to be associated with these chemicals and the uncertainty involved in extrapolating data from test animal receiving high doses of suspect compounds. Epidemiological evidence is accumulating that indicates correlations between trihalomethanes (including chloroform) in drinking water and cancer morbidity (mortality). Recently the U.S.E.P.A. has put forth a target level of 100 mg/l for THM in drinking water. Correlations between water source and cancer have also been shown. Cancer rates are frequently higher in areas that obtain drinking water from surface streams than in areas that use ground water. (Purdin-NWWA)

ECOLOGICAL EFFECTS OF URBAN STORMWATER RUNOFF ON BENTHIC MACROINVERTEBRATES INHABITING THE GREEN RIVER, MASSACHUSETTS,
Massachusetts Univ., Waltham. Dept. of Environmental Sciences.
J. M. Pratt, and R. A. Coler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 315, Price codes: A05 in paper copy, A01 in microfiche. University of Massachusetts Water Resources Research Center Publication No. 100, 1979. 75 p, 6 fig, 14 tab, 46 ref. OWRT-A-094-MASS (1), 14-34-0001-7046.

Descriptors: Aquatic animals, *Aquatic insects, *Bioindicators, *Environmental effects, Biological communities, Impaired water quality, Invertebrates, Massachusetts, Rivers, Runoff, *Urban runoff, *Water pollution effects, Indicator organisms, Green River.

Although it has been demonstrated that urban stormwater runoff can alter the quality of receiving waters, the corresponding impact on aquatic biota remains essentially undocumented. A year-long intensive study, therefore, was implemented to monitor and describe ecological effects exerted by urban runoff on benthic macroinvertebrates, and to develop practical methodologies for biological monitoring. Rock-filled, basket-type artificial substrates deployed periodically in nonurban and urban river reaches yielded collections of macroinvertebrates that furnished data for: (1) species diversity (the Brillouin index, H), (2) hierarchical diversity, (3) major-taxa composition, (4) collection dissimiliarity at the species level, and (5) indicator species. The overall results from these five analytical procedures strongly indicate that the macrobenthic community became progressively disrupted downstream in the urban reach. The stress imposed by urban runoff was most acute during the summer low flow and was probably localized in or near the stream bed. To assess the impact of urban runoff on an aquatic ecosystem, physical, chemical, and biological monitoring, therefore, should extend routinely into the benthos. (Godfrey-Mass)

HEALTH EFFECTS OF HUMAN EXPOSURE TO BARIUM IN DRINKING WATER,
Illinois Univ. at the Medical Center, Chicago.
G. R. Brenniman, W. H. Kojola, P. S. Levy, B. W. Carnow, and T. Namekata.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-292 268, Price codes: A07 in paper copy, A01 in microfiche. Final Report No. EPA-600/1-79-003, January 1979. 140 p, 4 fig, 81 tab, 71 ref, 4 append. R803918.

Descriptors: *Potable water, *Barium, *Public health, *Human pathology, Water pollution effects, Toxicity, Water analysis, Human diseases, Mortality, Morbidity, Epidemiology, West Dundee, McHenry(Illinois).

An investigation was undertaken to determine if health effects could be identified in a population exposed to barium in its drinking water. An analysis of death rates for communities exposed to barium concentrations of 2 mg/l or greater and

those with no significant exposure showed higher death rates for all 'cardiovascular diseases' and 'heart diseases' in barium exposed communities. A morbidity study was conducted in West Dundee and Mc Henry, Illinois, to determine if differences exist in mean blood pressure levels and the presence of hypertension, cardiovascular, cerebro-vascular and renal disease between the two populations. West Dundee's drinking water had a barium concentration 70 times that of the Mc Henry drinking water. Some significant differences were found for mean age and sex-adjusted levels of systolic blood pressures between the two communities, but these data were inconclusive due to inconsistencies in the findings. No significant differences were found between the communities regarding the prevalence of hypertension, heart disease, stroke, or kidney disease. No definite conclusion was drawn to permit the recommendation of a safe standard for barium in drinking water. (Davison-IPA)

HUMAN HEALTH EFFECTS OF MOLYBDENUM IN DRINKING WATER,
Colorado Univ., Boulder. Environmental Trace Substances Research Program.
W. R. Chappell, R. R. Meglen, R. Moure-Eraso, C. C. Solomons, and T. A. Tsongas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-292 755, Price codes: A06 in paper copy, A01 in microfiche. Final Report No. EPA-600/1-79-006, January 1979. 113 p, 19 fig, 23 tab, 187 ref, 3 append. R-803645.

Descriptors: *Potable water, *Molybdenum, *Public health, *Human pathology, Water analysis, Chemical analysis, Biochemistry, Animal physiology, Metabolism, Nutrient requirements, Waste water treatment, Water treatment, Water quality standards.

An assessment of the present environmental exposure to molybdenum and the health effects of such an exposure are presented. Molybdenum (MO), a trace element widely occurring in nature, plays an important biological role as a micronutrient for plants and animals. It can be toxic to animals at high levels. Concentration in surface waters is generally less than 5 micrograms/L, concentrations as high as 500 micrograms/L has been reported in some drinking waters. Greater concentrations than 20 micrograms/L are thought to be the result of industrial contamination. Conventional waste water and water treatment technoligies remove only 14% of molybdenum. In the U.S. average human intake via food is 170 micorgrams Mo/day; the average intake via drinking water is less than 5 micrograms Mo/day. No adverse health effects have been reported in the U.S., but Russian and Indian literature report cases of biochemical and clinical effects in humans at intakes ranging from 1 to 10 mg Mo/day. Data on molybdenum relating to the effects of its occurrence in drinking water are reviewed. An interdisciplinary study is also reviewed. Although a drinking water standard for molybdenum is not required, a maximum of 50 micrograms Mo/L is recommended as a guideline. (Davison-IPA)

SOME BIOCHEMICAL AND PHYSIOLOGICAL ASPECTS OF GROWTH AND GAMETOGENESIS IN CRASSOSTREA GIGAS AND OSTREA EDULIS GROWN AT SUSTAINED ELEVATED TEMPERATURES,
Woods Hole Oceanographic Institution, MA.
R. Mann.
Journal of the Marine Biological Association of the United Kingdom, Vol. 59, No. 1, p 95-110, 1979, 5 fig, 2 tab, 38 ref.

Descriptors: *Environmental effects, Temperature, Oysters, Reproduction, Spawning, Biochemistry, Animal physiology, Growth rates.

Two species of oysters (Crassotrea gigas and Ostrea edulis) were grown at sustained temperatures of 12, 15, 18, and 21 C for 19 weeks. Absolute live weight increment over the experimental period was greater in C. gigas than in O. edulis. Terminal live weights increased with increasing temperature in both species. Final dry meat weight was not related to temperature in C. gigas but was positively related to increasing experimental temperature in O. edulis. Both species showed an initial increase in percentage carbohydrate at all temperatures which was followed by a decrease in carbohydrate content in C. gigas. Evidence of hermaphroditism was found in 27% of O. edulis examined while none was found in C. gigas. Ripe gonads developed in both species at all temperatures but C. gigas spawned only at 18 and 21 C while O. edulis spawned at 15, 18, and 21 C. In the pre-spawning period, ammonia excretion data showed an allometric relationship with weight in both species. Post-spawning data showed a higher specific excretion rate for any given dry meat weight. Post-spawning data points do not fit any simple relationship that can be described by linear regression analysis. (Chilton-ORNL)

BRAIN GANGLIOSIDES AND TEMPERATURE ADAPTATION IN EURY- AND STENOTHERMIC TELEOST FISH (CARP AND RAINBOW TROUT),
Stuttgart Univ. (Germany, F.R.). Zoologisches Inst.
R. Hilbig, H. Rahmann, and H. Rosner.
Journal of Thermal Biology, Vol. 4, p 29-34, 1979, 6 fig, 32 ref.

Descriptors: *Environmental effects, *Temperature, Seasonal, Fish, Carp, Rainbow trout, Physiology, Temperature adaptation, Acclimation, Fish brain, Nervous system.

Data showed significant changes in the brain ganglioside pattern of carp and rainbow trout during thermal adaptation to lowered environmental temperatures. During adaptation to experimentally induced acclimation as well as to seasonal temperature fluctuations, distinct changes in the brain gangliosides to a more polar pattern could be detected. In carp, this polysialization phenomenon was due to a decrease of almost all oligosialoganglioside in favor of polar fractions. In trout brains a more differentiated pattern change occurred, which was characterized by a conspicuous decrease in the concentration of the hematosideganglioside. Further investigation into these physico-chemical properties of brain gangliosides and ganglioside-containing membrane preparations of animals from different temperature biotopes is needed. (Chilton-ORNL)

CHEMICAL TECHNOLOGY AND ECONOMICS IN ENVIRONMENTAL PERSPECTIVES; TASK IV - ACTIVATED CARBON,
Midwest Research Inst., Kansas City, MO.
G. L. Kelso, and T. W. Lapp.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 181, Price codes: A03 in paper copy, A01 in microfiche. Report EPA-560/2-77-002. 1977. 28 p, 5 tab, 21 ref.

Descriptors: *Activated carbon, *Specifications, *Standards, Heavy metals, Food processing industry, Waste water treatment, Water treatment, Organic compounds, Economics.

Information on various aspects of the manufacture and use of activated carbon was compiled. Market input-output data was determined including manufacturers, manufacturing sites, raw materials, production volumes, grades of product, and use patterns. Product quality specifications were determined with respect to the presence of heavy metal ions and/or polynuclear aromatic hydrocarbons in the commercial product. If impurities were present, procedures for their removal were determined. US annual capacity is 305 million lb of which about one half is granular. Of the 180 lb consumed in the US in 1975, 37% was used in the food processing and pharmaceutical industries, 25% in water or waste treatment processes, and 38% in other applications. The Food Chemicals Codex and specific consumer specifications are employed for heavy metal and polynuclear hydrocarbon content. Due to temperatures of about 1000C reached during the steam activation process, little, if any, quantities of PAH remain in activated carbon. (Small-FIRL)
W79-06507

WATER HYACINTHS FOR UPGRADING SEWAGE LAGOONS TO MEET ADVANCED WASTEWATER TREATMENT STANDARDS: PART II,
National Space Technology Labs., NSTL Station, MS.
B. C. Wolverton, and R. C. McDonald.
Available from the National Technical Information Service, Springfield, VA 22161 as N78-16481, Price codes: A02 in paper copy, A01 in microfiche. Report TM-X-72730, 1976. 22 p, 10 fig, 2 tab, 8 ref.

Descriptors: *Waste water treatment, *Water hyacinth, *Sewage lagoons, Filtration, Standards, *Efficiency, Waterfowl, Biological oxygen demand, Suspended solids.

Field studies on the use of water hyacinths (Eichhornia crassipes) as an inexpensive, natural biological waste filtration system for upgrading sewage lagoons, are reviewed. A single cell lagoon containing four or five surface hectares covered with water hyacinths with a retention time of at least 12 days, met the sewage effluent standards of Bay St. Louis. Over a four month period, the BOD dropped from 22 mg/liter to an average of 16 mg/liter and total suspended solids were reduced by 88% in the effluent from a background level of 125 mg/liter to 15 mg/liter. Water hyacinths were also a successful sewage treatment process for the Orange Grove lagoon. Coots were found to feed on the water hyacinths and could greatly decrease the efficiency of the system. Thus, it is necessary to protect the hyacinths from birds. (See also W77-00621) (Small-FIRL)

DISINFECTION EFFICIENCY AND RESIDUAL TOXICITY OF SEVERAL WASTEWATER DISINFECTANTS. VOLUME II. WYOMING, MICHIGAN,
Grand Valley State Colleges, Allendale, MI.
R. W. Ward, R. D. Giffin, and G. M. DeGraeve.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 448, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-77-203, 1977. 105 p, 21 fig, 38 tab, 33 ref.

Descriptors: *Waste water treatment, *Toxicity, *Chlorine, *Ozone, *Performance, Bromine, Municipal wastes, Disinfection, Fish, Minnows, Bioassay.

The effectiveness of chlorine, bromine chloride, and ozone as waste water disinfectants was compared, and the residual toxicity associated with disinfection by these methods or with chlorinated waste water which was dechlorinated with sulfur dioxide, was investigated. Nondisinfected trickling filter effluent from the Wyoming, Michigan Wastewater Treatment Plan was used in the tests. Three streams of the effluent were disinfected with

her chlorine, bromine chloride, or ozone and en delivered to the bioassay laboratory for resid- l toxicity tests. A fourth stream was delivered rectly to the bioassay laboratory for testing. lso, a portion of the chlorinated effluent was chlorinated with sulfur dioxide and then pumped the bioassay laboratory. Measurements were ade of: total and fecal coliform densities, total spended solids, volatile solids, COD, ammonia trogen, phosphate, turbidity, color, and pH. lso, each of the five waste water streams was sted for acute toxicity towards several species of h and invertebrates and chronic toxicity in a life rcle study with the fathead minnow (Pimephales omelas). Ozone was nontoxic to fish in concen- ations in waters after disinfection, sulfur dioxide minated the toxicity of chlorine, and bromine loride was less toxic than chlorine. Lack of a liable method for pacing ozone dosages impaired e disinfection effectiveness of ozone. (See also 77-11762) (Small-FIRL)

FFECT OF GEOGRAPHY ON THE EXTEN- IVE AGRICULTURAL USE OF SEWAGE,
rmy Terrestrial Sciences Center, Hanover, NH.
Wierzbicki.
vailable from the National Technical Information ervice, Springfield, VA 22161 as AD-A044 765, rice codes: A02 in paper copy, A01 in microfiche. raft Translation 642, 1977. 6 p, 2 tab. Translated om Gaz Woda Technika Santarna, Vol. 24, No. , p 407-410. 1950.

escriptors: *Waste water treatment, *Municipal astes, *Agriculture, Soils, Climates, *Europe, rrigation, Waste water disposal, Toxicity, Return ow.

Vaste water treatment through application of the ater to agricultural lands is limited by various soil nd climatic conditions. This method has been rgely abandoned in England because of the gen- ally heavy soil and the long growing season. lso, due to heavy industrialization, English mu- icipal waste water often contains chemicals which re harmful or toxic to plants. In Central Europe, ne conditions are favorable for waste water irriga- on. There is an insufficient amount of precipita- on during the growing season, the soil is general- y permeable, there is an abundance of light, and ne waste water is generally suitable for agricultur- l use. This method is common in Poland. (Small- IRL)

AIR POLLUTION ASPECTS OF SLUDGE IN- CINERATION.
Environmental Protection Agency, Cincinnati, OH.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 457, Price codes: A02 in paper copy, A01 in microfiche. Report EPA-625/4-75-009, 1975. 16 p, 4 fig, 6 tab, 2 ref.

Descriptors: *Incineration, *Sludge disposal, *Air pollution, *Municipal wastes, Clean Air Act, Opacity, Mercury, Sulfur compounds, Pesticides.

Incineration reduces sludge to a sterile landfill and removes offensive odors, but it can cause air pollu- ion problems. Existing, well-designed municipal waste water sludge incinerators are capable of meeting stringent standards. When particulate emission was studied, no relationship was found between mass emission rates of particulates and the percent of rated capacity at which the incinerator was operating, but a strong relationship was found between pressure drop across the scrubber and mass emission rates. The cost of the scrubbing systems was usually about 4% of the cost for the facility, and all plants tested easily met the opacity standard. No known existing plants approach the national emission standard for Hg. Possible gaseous pollutants include HCl, SO2, NOX, and CO. Again, properly operated incinerators did not exceed the limits for these pollutants. For some pesticides containing sludges, afterburners may be needed to achieve total destruction of the pesticides. (Small-FIRL)

CHARACTERIZATION OF PRIORITY POL- LUTANTS FROM A SECONDARY LEAD AND BATTERY MANUFACTURING FACILITY,
Battelle's Columbus Lab., Columbus, OH.
E. J. Mezey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-293 171, Price codes: A03 in paper copy, A01 in microfiche. Report EPA-600/2-79-039, January 1979. 41 p, 2 fig, 10 tab, 1 ref, 1 append.

Descriptors: *Metals, *Lime, *Flocculation, *Settling basins, *Slurries, Copper, Zinc, Lead, Cadmium, Mercury, Chromium, Nickel, Waste water treatment, Industrial wastes.

An evaluation of a lime and settling treatment of effluent from a manufacturing plant producing secondary lead from old batteries was conducted according to EPA protocol procedures for priority pollutants. The treatment process mixes 3,738 lbs dry lime/day with 410,500 gpd of influent waste water. The slurry is then fed to a second reaction tank where it is treated with a flocculating agent at a rate of 3.8 liters/min to promote flocculation and crystal growth. The waste water then undergoes clarification and settling before discharge to a receiving stream. Underflow is thickened to 5% solids and landfilled. The treatment process reduced copper by 75.0%, zinc by 91.0%, lead by 95.0%, cadmium by 73.0%, and mercury by 100.0%. Benzene and cyanide concentrations were reduced to below their detection limits; phenols were below detection limits in both influent and effluent. The removal of antimony, chromium, and nickel from the waste water could not be evaluated with any degree of confidence because of extremely low concentrations of these metals. (Lisk-FIRL)

DEVELOPMENT AND PRESENT CONDITION OF SEWAGE TREATMENT AND UTILIZA- TION IN BERLIN,
Army Terrestrial Sciences Center, Hanover, NH.
K. Weiland.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A046 780, Price codes: A11 in paper copy, A01 in microfiche. Draft Translation 655, 1977. 17 p, 5 fig. Translated from Wasserwirtschaft-Wassertechnik Vol. 7, p 229-235, July 1955.

Descriptors: *Municipal wastes, *Europe, *Agriculture, *Waste water treatment, *Sewage treatment, Sewerage, Settling basins, Performance, Irrigation, Return flow.

The development and utilization of the sewage treatment system of the city of Berlin, Germany as of 1955, are reviewed. Berlin's sewage treatment system began in 1878 when its first sewer system began operation. Sewage was processed on agricultural lands. In 1928, the Municipal Drainage System utilized 23,036 hectares excluding woodlands. Of these, 10,708 hectares were used for drainage and the remaining areas were channel, water, and gardening surfaces. In 1953, 17,900 hectares were in use. In 1955, there were 654 settling basins in operation. The settling cycle for the basins ranged from one to one and one half hours, and the degree of purification was 70 to 95%. The design of several drainage areas is described. (Small-FIRL)

STUDY ON THE EFFECTIVENESS OF DISIN- FECTING SEWAGE CONTAINING TUBERCU- LOSIS BACILLI WITHOUT BIOLOGICAL TREATMENT,
W. Dozanska, and W. Manowska.
Available from the National Technical Information Service, Sringfield, VA 22161, as ORNL-tr-4364, Price codes: A 02 in paper copy, A01 in microfiche. Translatd from Panstwowy, Zaklad nigreny. Roczinki. Translation 1977. 12p, 4 tab, 19 ref. Warsaw Vol 23, No 3, 1972.

Descriptors: *Disinfection, *Chlorination, *Sewage treatment, Sewage bacteria, *Bacteria, Waste treatment.

The possibility of effective disinfection of sewage containing tuberculosis bacilli by means of mechanical purification without biological treatment was investigated. Laboratory tests were performed on the influence of various suspensions upon destruction of bacilli in an aqueous environment using chlorine. Mechanical treatment and disinfection by chlorine were effective. When residual chlorine levels were 5 mg/liter Cl after 60 min, destruction of the tubercle bacilli approached 100%. Using this method, chlorine demand was 1.8 times greater than after biological purification. Virulent strains of tubercle bacillus were detected in sewage using various biological methods and guinea pigs. (Small-FIRL)

PAPERMILL EFFLUENT TURBIDITY RE- MOVAL -- A NEW APPROACH,
J. Delaine.
Effluent and Water Treatment Journal, Vol. 18, No. 5, p 219-221, 223, May, 1978. 2 fig, 4 ref, 3 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Turbidity, Wastes, Industrial wastes, Waste

treatment, Water pollution treatment, Water pollution sources, Pulp and paper industry, Effluents, Sedimentation, Separation techniques, Flocculation, Sludge, Enzymes, Clays, Electrolytes, Polyelectrolytes, Lime, Sea water, Aluminum sulfate, Manganese sulfate.

Rising water treatment and effluent treatment costs have directed considerable attention to the closure of water systems within the paper industry. Coupled with the increasing use of secondary fibers in paper mills, this often leads to new problems in effluent treatment, particularly higher concentrations of starch-stabilized fines in the effluent. Clarification of such effluents by conventional means may be difficult. New and modified effluent sedimentation procedures are evaluated, namely, the sludge contact process in which preformed flocs of sludge are mixed with the incoming chemical-dosed feed, enzyme-assisted aluminum sulfate flocculation (e.g., alpha-amylase), replacement of aluminum sulfate by a bentonite/high-molecular weight polyelectrolyte system for flocculation, and the addition of hydrated manganese sulfate directly or indirectly (i.e., contained in sea water) during lime treatment. (Swichtenberg-IPC)

METHOD FOR THE TREATMENT OF SEA DISCHARGED SEWAGE,
Hydrotechnic Corp., NY. (Assignee).
R. Nebolsine.
U.S. Patent No. 4,128,477, 7 p, 1 fig, 8 ref; Official Gazette of the United States Patent Office, Vol. 977, No. 1, p 201, December 5, 1978.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, Waste water disposal, Sewage effluents, Filtration, Coagulation, Oxidation, Separation techniques, Ocean disposal, Outfalls.

A method is disclosed for treating sewage destined for discharge into the sea. The fluid treatment process comprises conducting the sewage through bar racks, and degritters to remove large scale particles, extracting intermediate size particulate material in a rotary drum screen, introducing a chemical composition into the fluid to promote coagulation of particles having an average particle size of less than about 1 micron, filtering the fluid containing the coagulated particles through a deep bed multi-media filter, adjusting the quantity of dissolved oxygen in the filtrate to a predetermined level and discharging the oxygenated fluid to the sea some distance offshore to permit dispersal of any remaining contaminants by action of wind and currents. (Sinha-OEIS)

OZONE DISINFECTION IN WASTE WATER TREATMENT WITH RECYCLING OF OZONATION OFF GAS,
FMC Corp., Chicago, IL. (Assignee).
W. P. Key, D. C. Ihrig, and D. W. Monroe.
U.S. Patent No. 4,132,637, 22 p, 11 fig, 6 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 1, p 233-234, January 2, 1979.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, *Disinfection, Activated sludge, Ozone, Gases, Equipment.

A method of recycling the off gas from an ozone disinfection step used with an activated sludge waste water treatment system and apparatus for carrying out the method is described. In recent years the treatment of the effluent of effluent of sewage treatment plants - in the form of air or oxygen containing a few percent of ozone - has been widely used as an alternative to chlorination. Ozonation of sewage treatment plant effluent has been found to be very effective for disinfection of the effluent. The moisture is removed from a substantial portion but not all of the ozonation off gas, while the nitrogen and carbon dioxide contaminants that are contained in the off gas are left in it. The dried off gas is mixed with oxygen enriched gas from the original source, and the resulting mixture is delivered to the ozone generator for the production of more ozone. Another portion of the ozonation off gas is diverted upstream for introduction into the oxygen treatment facility of the activated sludge treatment plant. (Sinha-OEIS)
W79-06624

PROCESS FOR THE HYGIENIC ELIMINATION OF SEWAGE CONTAINING SALT-CONTAINING ORGANIC SUBSTANCES,
Von Roll A. G., Gerlafingen (Switzerland). (Assignee).
E. Filzmoser.
U.S. Patent No. 4,132,640, 6 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 978, no 1, p 235, January 2, 1979.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Industrial wastes, *Organic wastes, Water pollution treatment, Separation techniques, Incineration, Gases, Equipment, Oxidation, Combustion chamber.

A process is described where the concentrated industrial sewage is initially finely atomized, its remaining water percentage is evaporated by means of a hot gaseous medium accompanied by direct contact and as a result the dry substance in the sewage is separated. The thus obtained dry substance is pneumatically fed into a hot combustion chamber by means of an oxygen-containing carrier gas. Due to the rapid heating the salt suddenly passes into the gaseous phase without salt fusion and the organic substances are oxidized. The hot flue gases formed during the combustion of the organic substances and the salts in the gas phase are removed from the combustion chamber and rapidly cooled by means of air or water or both. The salts are removed from the flue gases which are discharged into the atmosphere. (Sinha-OEIS)
W79-06625

SLUDGE AND SLIME SEPARATING AND SETTLING DEVICE,
A. O. V. Hellqvist.
U.S. Patent No. 4,132,643, 5 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 978, no 1, p 236, January 2, 1979.

Descriptors: *Patents, *Waste water treatment, *Domestic wastes, *Water pollution treatment, Separation techniques, Slimes, Sludge, Solid wastes, Equipment.

This invention is related to a sludge and slime separating and settling device for treating all kinds of domestic waste water effluents. It is comprised of a container with a bottom and a lower, truncated conical part, an upper, truncated conical part with a spillover overflow extending around the upper edge, and an intermediate cylindrical part. The inlet is in the vertical direction in the middle of the container. The container is closed with a cover provided with an annular flow barrier wall extending from above the overflow level and dipping into the container. The device is preferably prepared from a plastic material, such as polyethylene or polypropylene. (Sinha-OEIS)
W79-06626

TWO-STAGE OIL SKIMMER SEPARATOR,
Sun Oil Co., Philadelphia, PA. (Assignee).
J. C. Bottomley, and H. G. Nash.
U.S. Patent No. 4,132,645, 5 p, 4 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 978, no 1, p 237, January 2, 1979.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Oil pollution, Water pollution treatment, *Separation techniques, Skimming, Heat treatment, Equipment, Oil refinery, Gravity separation.

A Two stage oil skimmer separator for separating a hydrocarbon, such as oil or wax, from the water in a hydrocarbon-water mixture is of particular utility for the output from an oil refinery storm sewer system. The first stage of the separator includes a tank which allows gravity separation of the hydrocarbon and water. The floating hydrocarbon is skimmed off the top and directed to a second stage separator. The settled water passes under a baffle to retain the hydrocarbon within the system while passing the water out of the separator. The skimmed hydrocarbon, containing some water, is directed to the second stage where it is heated to facilitate further separation. The hydrocarbon is passed from the top of the second stage to storage tanks in the refinery. The water in the bottom of the second stage tank is returned to the first stage for further separation. (Sinha-OEIS)

AGENT FOR REMOVING HEAVY METALS,
Chisso Corp., Osaka (Japan). (Assignee).
R. Tarao, K. Kaku, M. Hayashi, T. Nakamura, and S. Ohishi.
U.S. Patent No. 4,133,755, 11 p, 10 tab, 3 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 2, p. 613, January 9, 1979.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Heavy metals, *Mercury, Water pollution treatment, Absorption, Granules, Dithiocarbamate compounds.

Heavy metals such as mercury are removed from waste water by passing the waste water through a column packed with a granulated product containing a dithiocarbamate compound, amorphous silica and active carbon powder. The granulated product is obtained by blending and shaping these materials together with a binder composed mainly of vinyl acetate polymer resin and an excipient composed mainly of clay. The granulation method is carried out by blending a composition consisting of a dithiocarbamate bond-containing low molecular weight compounds, active carbon powder and amorphous silica with water, an excipient composed mainly of a clay and a binder composed mainly of vinyl acetate polymer resin to obtain a blend having a water content of 25-35%, which is then subjected to extrusion-granulation. (Sinha-OEIS)
W79-06632

PROCESS FOR PURIFICATION OF WASTE WATER PRODUCED BY A KRAFT PROCESS PULP AND PAPER MILL,
National Aeronautics and Space Administration, Washington, DC. (Assignee).
M. F. Humphrey.
U.S. Patent No 4,134,786, 6 p, 1 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 978, No 3, p 968, January 16, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Pulp wastes, Pulp and paper industry, Chemical reactions, Chemical precipitation, Separation techniques, Activated carbon, Lignins, Product recovery.

A method and means for purifying the waste water from paper and pulp mill wastes obtained from a mill using the Kraft process is described. First the lignins and lignin derivatives are precipitated from the waste stream with quaternary ammonium compounds. Next other impurities are removed by activated carbon produced from the cellulosic components of the water and then water is separated from the precipitate and solids. The activated carbon also acts as an aid to the separation of the water and solids. If recovery of lignins is also desired, then the precipitate containing the lignins and quaternary ammonium compound is dissolved in methanol. Upon acidification, the lignin is precipitated from the solution. The methanol and quaternary ammonium compound are recovered for reuse from the remainder. (Sinha-OEIS)

METHOD OF PURIFYING WASTE WATER,
Swenska Sockerfabriks AB, Malmo. (Assignee).
H. Skogman, and L. Huss.
U.S. Patent No 4,134,830, 5 p, 2 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 978, No 3, p 981-982, January 16, 1979.

escriptors: *Patents, *Waste water treatment, Water pollution treatment, *Organic wastes, Carbohydrates, Proteins, Biological treatment, Anaerobic conditions, Aerobic conditions, Activated udge, Separation techniques, Sludge treatment, ugar industry.

method of purifying waste water rich in carbohydrates or proteins is based on biological purification in two stages, a first anaerobic stage and a cond aerobic stage. In the anaerobic stage the udge content is kept at a high level, while selecting the conditions so that methane fermentation ith subsequent reduction of the pollutants is obined. Water containing sludge, formed in the naerobic stage, is subsequently exposed to sludge paration while forming a first sludge concentrate hich is returned to the anaerobic stage, i.e., it is circulated. After the sludge separation, the water eated in the first stage is treated in the aerobic age, where remaining pollutants, thanks to the nversion in the anaerobic stage, are present in ich a form, that they can easily be utilized by erobic organisms. The sludge-bearing water rmed in the aerobic stage is subjected to sludge paration while forming a second sludge concenate at least a portion of which is returned to the erobic stage while possible surplus is recirculated the anaerobic stage. Sludge from the first sludge ncentrate and possibly also from the second udge concentrate is drawn off and taken away for isposal. (Sinha-OEIS)

ATER RECYCLE UNIT-GREY WATER LEARIFIER,
. J. McCormick.
.S. Patent No 4,134,833, 6 p, 3 fig, 6 ref; Official azette of the United States Patent Office, Vol 78, No 3, p 982, January 16, 1979.

escriptors: *Patents, *Waste water treatment, Water pollution treatment, *Water reuse, Water urification, Domestic water, Separation techiques, Recycling, Filtering, Grey water, Settling.

he primary object of this invention permits water be recycled indefinitely for certain operations, uch as washing, so that the overall, total use of ater in households, and in certain industries can e substantially reduced. A water recycle unit for roducing clear water output from grey water nput comprises a container which has sufficient apacity to provide the time required for the grey ater input to go through all of the physical hanges needed to provide a clear water output. hese physical changes include the settling of eavy materials, such as sand and dirt, to a lower one and the rising of lighter materials, such as oil nd fibers, to an upper zone to leave a central zone f clear water between the lower and upper zones ithin the container. The container includes outlet penings located in a side wall of the container at a evel which is normally above the upper side of the one of clear water within the container. A gate within the interior of the container includes a losed passageway for removing clear water from he central zone through the outlet in response to he inflow of additional grey water. A clear water ollecting and filter box is built alongside of and ntegrally with the container. (Sinha-OEIS)

OIL/WATER SEPARATION: STATE-OF-THE-ART,
Rutgers - the State Univ., New Brunswick, NJ. Dept. of Chemical and Biochemical Engineering.
F. A. Osamor, and R. C. Ahlert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 755, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-069, April 1978. 106 p, 10 fig, 4 tab, 176 ref. R803978.

Descriptors: *Waste water treatment, *Water pollution treatment, *Oil spills, *Oil pollution, Oil wastes, Water pollution sources, Oily water, Filtration, Membrane processes, Reverse osmosis, Adsorption, Separation techniques, Absorption, Specifications, Chromatography.

Devices and processes for oil/water separation are classified into 11 categories according to the primary mechanism inducing the separation. The characterization of oil/water systems is examined, followed by a parallel characterization of oily waste waters. The basic principle of each category of devices or processes and the specific design features, operational modes, and limitations are discussed. Literature on test evaluation of a number of devices is reviewed on the basis of actual or potential success in treating oil/water system conditions. No single technique is capable of separating all oil/water system conditions efficiently, although reverse osmosis, ultrafiltration, and carbon adsorption have great potential. The high equipment and operation costs of these limit their use for treating oily waste streams. For production of effluents with the desired discharge quality of less than 10 ppm of oil, a combination of devices in a process change is necessary. The specific characteristics of an oily waste water regulate the combination of devices that give the required effluent concentrations. (Davison-IPA)
W79-06775

PROCEEDINGS, FIFTH UNITED STATES/JAPAN CONFERENCE ON SEWAGE TREATMENT TECHNOLOGY,
Environmental Research Center, Cincinnati, OH.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 216, Price codes: A08 in paper copy, A01 in microfiche. Report No. EPA-600/9-77-027, December 1977. Conference held in Tokyo, Japan, April 18-22, 1977. 578 p, 282 fig, 186 tab, 339 ref.

Descriptors: *Conferences, *Sewage treatment, *Industrial waste treatment, Water pollution treatment, Activated carbon, Filtration, Technology, Government finance, Water quality control, Management, Water reuse, Run-off, Combined sewers, Sewage, Water pollution control, Monitoring.

The 16 papers presented at a joint U.S.-Japan conference on sewage treatment technology are compiled. The five Japanese papers describe industrial waste water control into public sewers, storm and combined sewer overflows; regeneration of granular activated carbon; deep aeration tanks; upgrading existing plants by chemical addition to aeration tanks; and rapid sand filtration process for tertiary purpose. The topics covered by the U.S. series of papers includes control of non-point source pollution; use of new technology in the EPA Construction Grant Program; Georgia's water quality control program Federal-State-regional participation in the development of a waste water management plan; regional domestic waste water management; urban run-off pollution control technology; waste water reuse; industrial waste water pre-treatment and joint treatment; criteria and assessment of waste treatability; biological nitrogen and phosphorus control; and water reclamation technology. It is concluded that the technology exchange program and conference were valuable to both countries. (Davison-IPA)

RECENT DEVELOPMENTS IN THE SANDIA LABORATORIES' SEWAGE SLUDGE IRRADIATION PROGRAM,
Sandia Lab., Albuquerque, NM.
H. D. Sivinski, J. R. Brandon, M. E. Morris, K. S. Neuhauser, and R. L. Ward.
Available from the National Technical Information Service, Springfield, VA 22161 as SAND-77-1411, Price codes: A04 in paper copy, A01 in microfiche. Report no. SAND-77-1411, November 1977. 70p, 14 fig, 23 tab, 33 ref. AT(29-1)-789.

Descriptors: *Sludge treatment, *Irradiation, *Heat treatment, *Sludge disposal, Waste storage, Bacteria, Viruses, Pathogenic bacteria, Feeds, Dewatering, Laboratory tests, Investigations, Waste treatment, Sludge, Organic wastes, Liquid wastes.

Recent pathogen reduction work, sludge processing costs, agronomics and animal refeeding studies, and product enhancement and physical/chemical effects are reviewed. Studies show that irradiation with 1 Mrad effectively eliminates pathogenic bacteria and viable parasite ova in liquid sludges. Heat is effective in reducing the levels of pathogenic bacteria, Ascaris ova, and viruses. Ammonia was shown to be virucidal to poliovirus and other enteric viruses. That effects of irradiation of sludges on dewatering properties are not significant compared to polymers was shown by physical/chemical effects studies. When used as a feeding supplement for sheep and cattle, dried irradiated undigested sludge was shown to have significant nutritional value; no significant harmful effects have been demonstrated in this feeding program. Most of the work reported has been done in liquid sludges, but the emphasis in the program has shifted to the treatment of dried sludges. A status report on the dried sludge irradiator being built is included. (Davison-IPA)
W79-06782

MARKETING FEASIBILITY OF USING CEDAR MILL WASTE FOR OIL SPILL CLEAN-UPS,
Northern Maine Regional Planning Commission, Caribou.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 476, Price codes: A04 in paper copy, A01 in microfiche. Final Report No. EDA 78-059, February 1978. 54 p, 10 append. 01-6-01535.

Descriptors: *Oil spills, *Water pollution, *Water pollution abatement, Waste treatment, Recycling, Industrial wastes, Water pollution treatment, Absorption, Marketing techniques, Wood wastes, Research and development, Specifications.

An excelsior product developed from cedar mill wastes has the potential for use in oil spill clean-ups and industrial oil-type removal processes. The first step in a three-phase market study involved drawing up a list of specifications as best as could be done without controlled laboratory testing. The specifications covered all the important areas concerning oil spill clean-up such as product density, absorption, efficiency, and disposability. The specification information was obtained through using a small testing tank at the lumber company where the product was developed. The second step of the study involved developing the questionnaire which consisted of seven questions on the market potential of the product and its packaging. The third step was the development of an introductory letter explaining the project and the most important aspects of the proposed product. The market study package was sent to interested contractors. This cedar residue has a very high absorption ratio compared with other absorbents used today. Lake, pond, and stream oil spills; industrial transfer accidents; and small oil spills on the open sea and around docks are some possible uses for this product. (Davison-IPA)
W79-06788

FULL-SCALE DEMONSTRATION OF NITROGEN REMOVAL BY BREAKPOINT CHLORINATION,
Stone (Richard W.) Sacramento, CA.
R. W. Stone.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 657, Price codes: A05 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-029, March 1978. 80 p, 31 fig, 7 tab, 6 ref, 2 append. S-803343-01-0.

Descriptors: *Waste water treatment, *Chlorination, *Evaluation, On-site investigations, Chemical reactions, Alkalinity, Design criteria, Ammonia, Nitrogen, Oxidation, Nitrates, Water pollution

sources, Water purification, Water pollution treatment, Water pollution control, Water quality control, Water treatment, Municipal wastes, Rancho Cardova(California).

A large-scale demonstration program was carried out to establish design and operating criteria of breakpoint chlorination for nitrogen removal systems for use in municipal waste water treatment applications. Breakpoint chlorination process chemistry is discussed, chemical consumption is evaluated, and process control recommendations are made. The theoretical dosage of chlorine required to convert 1.0 mg/l of ammonia nitrogen to nitrogen gas is 7.6 mg/l; an average dosage of 10 mg/l chlorine was required in the process evaluated. The difference between these dosages was due to chlorine consumption from the oxidation of ammonia nitrogen to nitrate nitrogen which is a competing side reaction having a less desirable end product. About 96% of the chlorine dosed to the system was accounted for in reactions between chlorine and nitrogenous species in specific, identified chemical pathways, and as free chlorine remaining in solution following breakpoint. The rate of the breakpoint reaction varied depending on the system pH; the fastest rates were at a pH of 7.0. This evaluation showed that the process requirement for alkalinity supplementation was nearly exactly equal to that predicted from the chemical stoichiometry. (Davison-IPA)

DESIGN OPTIMIZATION OF HIGH-RATE DISINFECTION USING CHLORINE AND CHLORINE DIOXIDE,
O'Brien and Gere Engineers, Inc., Syracuse, NY.
D. F. Geisser, S. R. Garver, and C. B. Murphy, Jr.
Journal of the Water Pollution Control Federation, Vol 51, No 2, p 351-357, February 1979. 9 fig, 3 tab, 15 ref.

Descriptors: *Design, *Optimization, *Disinfection, *Effects, *Regression analysis, *Waste water treatment, *Chlorine compounds, Performance, Coliforms, Evaluation, Equations, Mathematical models, Systems analysis, Cost minimization, Cost effectiveness.

Pilot-plant treatability studies of high-rate disinfection with chlorine and chlorine dioxide were conducted in Rochester, New York as part of the Combined Sewer Overflow Abatement Program for the Monroe County Division of Pure Waters. Using data acquired during the pilot-plant investigations, mathematical performance models were developed for both chlorine and chlorine dioxide disinfection cost and performance comparisons of chlorine and chlorine dioxide for several alternative treatment systems. Optimization analysis results indicated that a high-rate disinfection system using short detention times and high-intensity mixing appears to be a more cost-effective technique than either a corrugated baffle or conventional system for the disinfection of Rochester combined sewer overflows. In general, the use of chlorine is preferred over chlorine dioxide on a cost-performance basis. (Bell Graf-Cornell)
W79-06803

PUTTING SLUDGE TO WORK.
Ground Water Age, Vol. 13, No. 8, p 22, April, 1979. 1 fig.

Descriptors: *Water reuse, *Recycling, Sludge disposal, Sewage treatment, Waste water(Pollution), Groundwater, Water quality.

A unique approach to wastewater renovation, developed by Michigan State University, uses a system of lakes, marshes, and irrigation in conjunction with a conventional wastewater treatment plant. The advantages of this system are that biological materials can be harvested and used, nutrients can be recycled, and municipal wastewater can be cleaned in a process that requires no pretreatment and uses solar energy. Lake vegetation absorbs nutrients in the wastewater and is harvested for compost or animal feed. Water from the lakes is applied to a nearby land system through spray irrigation. The MSU system has an extensive array of wells to monitor ground water quality. This system promises to be economical both on a short-term and a long-term basis. However, it may not be practical for large communities due to the land areas required. (Purdin-NWWA)

BIOLOGICAL TREATMENT, EFFLUENT REUSE, AND SLUDGE HANDLING FOR THE SIDE LEATHER TANNING INDUSTRY,
Polkowski, Boyle and Associates, Madison, WI.
L. B. Polkowski, W. C. Boyle, and B. F. Christensen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 676, Price codes: A12 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-013, February 1978. 246 p, 88 fig, 83 tab, 6 ref, 3 append. 12120 DSG.

Descriptors: *Biological treatment, *Industrial wastes, *Tannery wastes, *Evaluation, Sludge disposal, Waste treatment, Water reuse, Water pollution treatment, Water conservation, Leachate, Chemical analysis, Effluents, Liquid wastes, Water pollution, Solid wastes.

The treatability of unsegregated, unequalized, unneutralized waste waters from a side-leather tanning industry using the hair pulping process by primary and secondary biological treatment methods is evaluated. Screening and gravity separation in clarifier-thickeners comprised the primary treatment; the secondary treatment method utilized aerated ponds and final clarifiers capable of recycling biological solids. The system was operated over a wide range of detention times during seasonal variations with monthly temperature ranges from -14C to 30C, and with and without solids recycle and nutrient addition. Generally, the results indicated that the system is unable to meet the Best Practicable Treatment and Best Available Treatment guidelines which served as a comparison. Except for oil and grease, the raw waste water characteristics for this type of processing were within EPA guideline limitations. In evaluating the effects of water conservation practice on leather qualities and to determine conservative substances buildup in the waste water effluent, the secondary treatment effluent was used in the beamhouse operations under test conditions. TREATMENT AND RECOVERY OF FLUORIDE AND NITRATE INDUSTRIAL WASTES: PHASE II,
Grumman Aerospace Corp., Bethpage, NY.
C. J. Staebler, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 159, Price codes: A05 in paper copy, A01 in microfiche. Final Report No. EPA-600/2-78-048, March 1978. 85 p, 29 fig, 18 tab, 26 ref. S800680.

Descriptors: *Waste water treatment, *Industrial wastes, *Byproducts, Fluorides, Nitrates, Ion exchange, Effluents, Centrifugation, Water purification, Calcium compounds, Fertilizers, Analytical techniques, Sludges, Equipment, Evaporators, Water pollution treatment, Waste treatment, Sludge treatment.

The laboratory and pilot-scale techniques described were developed to treat selected chemical processing solutions and rinse waters containing fluorides, nitrates, and to recover usable byproducts. The following lime treatment parameters were optimized for various fluoride and nitrate effluent levels: temperature, retention time, pH, and slurry concentration. Ion exchange techniques which reduced rinse water concentrations of fluoride to 3 ppm and nitrate to 10 ppm were developed. Pilot-scale centrifugal techniques were developed to separate calcium fluoride and metal hydroxide sludges. In the optimized pilot-scale system the nitrate concentration of centrifuged effluents was reduced from 28,000 to less than 5 ppm by passing these effluents through a thin film, mechanically aided evaporator. The pilot treatment system reduced fluoride concentration from 117,000 to less than 1 ppm. Chemical and mechanical property tests revealed that calcium fluoride sludge is potentially feasible as a strength-maintaining additive for concrete. Greenhouse tests indicated that concentrated calcium nitrate recovered from the mechanically aided evaporator is a beneficial and practical plant fertilizer. The economics and production scale-up plans for ion-exchange rinse water treatment and process treatment are presented. (Davison-IPA)

EVALUATION OF THE RBC PROCESS FOR MUNICIPAL WASTEWATER TREATMENT,
Pewaukee, WI.
D. L. Kludge, R. J. Kipp, and C. J. Crandall.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 496, Price codes: A06 in paper copy, A01 in microfiche. Final Report No. EPA-600/2-78-028, March 1978. 104 p, 48 fig, 62 tab, 9 append. S802905.

Descriptors: *Waste water treatment, *Rotating biological contactor, *Trickling filter, Nitrification, Phosphorus, Biochemical oxygen demand, Suspended solids, Treatment facilities, Water pollution treatment, Water quality standards, Evaluation, Pewaukee(Wisconsin).

The rotating biological contractor (RBC) was operated as a full scale process at the Pewaukee, Wisconsin, waste water treatment plant to determine if it could consistently produce an effluent phosphorus concentration below 1.5 mg/ (total phosphorus) and biochemical oxygen demand (BOD) and suspended solids (SS) levels below 15 mg/l. In Phase I the effectiveness and efficiency of the process was demonstrated, evaluated, and compared with a parallel 1136 m3/day (0.30 mgd) trickling filter. Superior BOD and SS values were obtained with the RBC process, but better nitrification was obtained with the trickling filter. In Phase II phosphorus removal was demonstrated and evaluated; treatment was upgraded by the addition of alum and ferric chloride to the RBC process at two feed points upstream and downstream from the RBC units. The results indicated that although the mineral addition improved RBC phosphorus removal, the BOD and SS values of the effluent deteriorated. This occurred regardless of the location of the mineral addition or the cation species used for phosphorus removal. It is concluded that the RBC process effluent met and exceeded the secondary treatment standards, and that it gave a superior effluent quality regarding BOD and total SS than the trickling filter. SORBENTS FOR FLUORIDE, METAL FINISHING, AND PETROLEUM SLUDGE LEACHATE CONTAMINANT CONTROL,
New Jersey Inst. of Tech. Newark.
P. C. Chan, R. Dresnack, J. W. Liskowitz, A. Perna, and R. Trattner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 696, Price codes: A05 in paper copy, A01 in microfiche. Final Report No. EPA-600/2-78-024, March 1978. 93 p, 30 fig, 12 tab, 18 ref. R803717.

Descriptors: *Sorbents, *Waste treatment, *Leachate, *Industrial wastes, *Sludge, Wastes, Fluorides, Alkalis(Bases), Oil wastes, Clays, Illite, Kaolinite, Activated carbon, Fly ash, Lysimeters, Zeolites, Cullites.

The use of ashes, vermiculite, illite, activated carbon, kaolinite, natural zeolite, activated alumina, and cullite was investigated to determine their capability to remove leachate contaminants produced from the three industrial sludges: calcium fluoride, metal hydroxide, and petroleum. Leachate analysis showed considerable variations in composition and concentration of the constituents in leachate prepared from the same industrial sludge. Batch and lysimeter studies evaluating the static and dynamic sorbent capacity for the leachate constituents revealed that no single sorbent can be used to reduce the concentration of leachate constituents; combinations of two, three, or four

ents are capable of reducing them. The combi-
on, activated carbon and activated alumina,
more effective for treating calcium fluoride
ge leachate, and less effective than ash and
combinations in treating metal finishing and
oleum sludge leachates. The selection of a sor-
combination is sludge leachate specific. Sor-
s under dynamic conditions achieved greater
cities for the measured contaminants in the
hates than were achieved under static condi-
s. Change in pH of the sorbent from acidic to
line favored the removal of cations. (Davison-
)

t, *Game theory, *Least-cost regionalization,
bability, Systems analysis, Equations, Meramec
er basin(Missouri), Effluent dischargers, Eco-
ic benefits, Environmental benefits, Economies
cale, Incentives, Shapley value.

re are economies of scale in the construction of
onal wastewater treatment systems. Effluent
hargers have the option of participating in a
onal system or constructing separate smaller
ems. In order to encourage participation in a
onal system so that the economies are realized,
cost allocation method employed must offer
nomic incentives. The cost allocation problem
ewed in game theoretic terms, and the Shapley
e (a game theory solution) is suggested as an
cation method. The method is applied to the
amec River Basin in Missouri where eight
hargers are identified. The problems of appli-
on are discussed and the reactions of the eight
hargers are cited. (Bell Graf-Cornell)

NDLING AND DISPOSAL OF SLUDGES
OM COMBINED SEWER OVERFLOW
EATMENT: PHASE III--TREATABILITY
UDIES,
virex, Inc., Milwaukee, WI. Environmental Sci-
es Div.
Osantowski, A. Geinopolis, R. E. Wullschleger,
M. J. Clark.
ailable from the National Technical Information
vice, Springfield, VA 22161 as PB-281 006,
ce codes: A12 in paper copy, A01 in microfiche.
Report No. EPA-600/2-77-053c, December 1977. 272 p, 51 fig, 142 tab, 18 ref, 5 append. 68-03-0242.

Descriptors: *Combined sewers, *Sludge, *Sludge treatment, *Centrifugation, *Anerobic digestion, *Dewatering, Economics, Capital costs, Operating costs, Municipal wastes, Sewage, Sewage treatment, Kenosha, Racine, Milwaukee(Wisconsin).

Results of a project evaluating the handling and disposal of combined sewer overflow (CSO) treatment residuals are reported. At Kenosha, Racine and Milwaukee, Wisconsin, CSO sludges were thickened and dewatered using a mobil centrifuge sludge dewatering van. A bench scale anaerobic digestion system was used to evaluate anaerobic digestion of the sludges. To compare the use of thickening-centrifugation for dewatering CSO sludges and municipal sewage treatment plant sludges, each city's dry-weather treatment plant sludge was also tested using the thickening-centrifugation process. The results indicate dewatering of CSO sludges appears feasible when sludges are first degritted, if required, and thickened before centrifugation. Under optimum centrifuge operating conditions thickened sludges were dewatered to Cake concentrations with solids recoveries ranging from 80% to 99%. The dewatering characteristics of wet-dry weather sludge mixtures at Kenosha were similar to those for CSO sludge alone. According to the bench scale anaerobic digestion studies no significant adverse effect was realized by adding CSO generated sludges to dry-weather digesters at similar feed rates to those expected from a typical storm. Preliminary estimates indicate that first investment capital costs for thickening-centrifugation of CSO sludges ranged from $0.31 million to $2.92 million with annual costs ranging from $49,000 to $659,300/year for handling 4.0 to 36.5 tons/day of dry sludge. PILOT INVESTIGATION OF SECONDARY SLUDGE DEWATERING ALTERNATIVES,
National Council of the Paper Industry for Air and Stream Improvements, Inc., Kalamazoo, MI.
R. A. Miner, D. W. Marshall, and I. Gellman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 982, Price codes: A07 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-014, February 1978. 126 p, 26 fig, 33 tab, 8 ref, 5 append. R-804019-01-0.

Descriptors: *Sludge treatment, *Pulp and paper industry, *Pulp wastes, *Bleaching wastes, Dewatering, Filtration, Centrifugation, Ultrafiltration, Industrial wastes, Waste treatment, Water pollution sources, Wastes.

The findings of a field investigation are reported in which the following eight pilot dewatering devices were operated on biological sludge from an integrated bleached kraft-fine paper mill: (1) pressure filtration, (2) precoat vacuum filtration, (3) filter belt pressing, (4) multiple role pressing, (5) capillary filter belt pressing, (6) capillary suction dewatering, (7) horizontal bowl centrifuging, and (8) ultrafiltration. Three levels of performance are indicated based upon a criterion of attainable cake consistency: (1) pressure filtration and precoat vacuum filtration generated the driest cakes; (2) filter belt pressing produced cakes of intermediate consistencies; and (3) the low cake consistencies were produced by gravity filtration, centrifugation and ultrafiltration. It was found that performance was severly affected by changes in feed sludge consistency, the amount of sludge conditioning, and the sludge's specific resistance to filtration. The extreme variability of the type and amount of sludge conditioning required depended on the dewatering technique being used, the level of performance expected of it, and the consistency and nature of the sludge being dewatered. COAST GUARD RESPONSE TO OIL SPILLS--TRYING TO DO TOO MUCH WITH TOO LITTLE,
General Accounting Office, Washington, DC.
E. B. Staats.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 911, Price codes: A05 in paper copy, A01 in microfiche. Comptroller General's Report to the Chairman, Subcommittee on Transportation and Related Agencies, Committee on Appropriations United States Senate, May 16, 1978. 85 p, 14 fig, 5 append.

Descriptors: *Oil spills, *Waste water treatment, *Water pollution control, *Pollution abatement, *U S Coast Guard, Coasts, Oil wastes, Monitoring, Legislation, Federal Water Pollution Control Act, Water pollution sources, Water pollution treatment.

During the 1976 Coast Guard effectiveness in containing and cleaning up oil spills in five Coast Guard districts encompassing the Atlantic and Gulf coasts was reviewed. Because of the small quantities of oil spills reported for the Great Lakes, Pacific, and inland Coast Guard districts, they were not reviewed. Coast Guard response to all major and medium oil spills and a sample of minor spill occurring in the districts were analyzed. This analysis includes a chronology of events developed for each spill using Coast Guard, cleanup contractor, and spiller records, and interviews with officials. Coast Guard policies and procedures, training programs, personnel practices, contingency plans and pollution equipment capabilities were also examined. Results of this analysis indicate that the Coast Guard could have been more effective in about 38% of the cases in one or more of the following areas: faster responses to reported spills, better monitoring of cleanup operations, more effective action upon arrival at spills, attempting removal of spilled oil before it dissipates, and investigating reported oil spills of less than 10,000 gallons. The major limitations of the Coast Guard response to oil spills are staff shortages, inadequate training in the pollution abatement program, the need for additional equipment, improvement in its research and development program, and deficiences in contingency planning. EFFECTS OF DIVERSION AND ALUM APPLICATION ON TWO EUTROPHIC LAKES,
Kent State Univ., OH. Dept. of Biological Sciences.
G. D. Cooke, R. T. Heath, R. H. Kennedy, and M. R. McComas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 983, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA-600/3-78-033, March 1978. 116 p, 30 fig, 31 tab, 66 ref, 1 append. 16010 HCS, R 801936.

Descriptors: *Eutrophication, *Lakes, *Phosphorus, *Water pollution control, Septic tanks, Water pollution sources, Algae, Trophic level, Limnology, Nutrients, Plankton, Bioindicators, Biomass, Water pollution effects, Epilimnon, Hypolimnon, Ohio.

Diversion of septic tank drainage reduced the symptoms of eutrophication in the East (ETL) and West (WTL) Twin Lakes in Northeastern Ohio. Phosphorus (P) in lakes and streams declined and plankton biomass after diversion, however, during the subsequent five year monitoring period P and biomass remained those of moderately eutrophic lakes and P income remained above the permissable level. It was assumed that the P loading was of hypolimnetic origin, and 139.55 M3 (36,919 gals) of alum were added to the hypolimnion of WTL in July 1975; ETL was used as a downstream control. Although hypolimnetic concentration in 1976 was lowered, the reduced net internal P loading continued at a significant rate suggesting the littoral as an internal source. Epilimnotic P was also lowered, and a reduction of symptoms was indicated by a Trophic State Index, but WTL remained eutropic in 1976. It is suggested that hypolimnetic applications of alum may be more effective in large lakes

where seiches and vertical entrainment of hypolimnetic P are more significant. Details for dose determination and application are provided in the appendix. (Davison-IPA)

PBI REVERSE OSMOSIS MEMBRANE FOR CHROMIUM PLATING RINSE WATER,
Celanese Research Co., Summit, NJ.
H. J. Davis, F. S. Model, and J. R. Leal.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 944, Price codes: A03 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-040, March 1978. 36 p, 3 fig, 11 tab, 7 ref. R-803620.

Descriptors: *Waste water treatment, *Reverse osmosis, *Industrial wastes, *Polymers, Membranes, Fabrication, Heat treatment, Testing, Analytical techniques, Chromium, Polybenzimidazole.

Laboratory research wherein the attempt to develop a high temperature, oxidation-resistant reverse osmosis (RO) membrane of polybenzimidazole (PBI) for use in treating metal finishing effluents is reported. The effects of important casting variables and subsequent heat treatment on membrane RO properties were investigated. Membranes were tested on a high pressure circulating flow system in flat film test cells; screening was done by pretesting with a 5,000 ppm sodium chloride feed solution. A simulated rinse water containing chromic acid or plating bath solution was used to test membranes with optimum properties. PBI RO membranes were resistant to chromic acid attack. These same membranes exhibited high salt rejections when they were retested with sodium chloride which demonstrated that they had not been chemically attacked by chromic acid. Membranes pretreated with 5,000 ppm sodium tungstate tolution achieved significant improvement in long-term rejection of chromic acid; this was further improved by the continuous addition of sodium tungstate to the feed solution. Use of this approach to long-term high level rejection of chromic acid is an unacceptable practice due to the possible contamination of the plating bath by tungstate ions. Although membrane performance was improved by membrane treatment and feed pH adjustment, the project failed to develop an acceptable membrane to treat chromium plating rinse water. (Davison-IPA)

ANALYSIS OF OPERATIONS AND MAINTENANCE COSTS FOR MUNICIPAL WASTEWATER TREATMENT SYSTEMS,
Available from the National Technical Information Service, Springfield, VA 22161 as PB-283 471, Price codes: A13 in paper copy, A01 in microfiche. Report EPA 430/9-77-015, 1978. 232 p, 48 tab, 2 ref, 7 append.

Descriptors: *Municipal wastes, *Waste water treatment, *Cost analysis, *Cost comparisons, *Performance, Personnel, Operating costs, Maintenance costs, Efficiencies.

The operation and maintenance costs of municipal waste water treatment plants and collection systems were surveyed and analyzed. Costs are presented for different levels of waste water treatment, types of plants and collection systems, and segregated cost categories. Analyses are presented on relative costs for certain treatment variables and characteristics. Cost data utilized ranged from fourth quarter 1972 to first quarter 1977. Costs are adjusted to third quarter 1977 dollars. Only treatment plants of 1.0 mgd capacity or larger were sampled. A computer statistical package was used in the analysis. For all types of treatment levels, personnel, power, and chemical expenditures accounted for approximately 80% of total operating costs. Operating efficiency analyses indicated that the larger the plant, the lower the operation and maintenance costs per million gallons treated. Also, the more sophistoicated the treatment process, the more costly waste is to treat. The total operating costs are highest for sanitary sewer systems and lowest for mixed systems which have sanitary sewers plus storm sewer systems. (Small-FRC)

TRACE ORGANIC VARIATION ACROSS THE WASTEWATER TREATMENT SYSTEM OF A CLASS-B REFINERY,
Argonne National Lab., IL. Energy and Environmental Systems Div.
L. A. Raphaelian, and W. Harrison.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-285 596, Price codes: A09 in paper copy, A01 in microfiche. Report EPA-600/7-78-125, 1978. 183 p, 7 fig, 19 tab, 6 ref, 5 append.

Descriptors: *Pilot plants, *Activated carbon, *Activated sludge, *Industrial wastes, *Oil industry, Performance, Organic compounds, Filtration, Waste water treatment.

The efficiency of a pilot-scale granular activated carbon sludge treatment system of a Class B petroleum refinery that met BPT in 1977, was evaluated. Effluents at SOHTO's Toledo refinery from the full-scale system (dissolved-air-flotation unit and final clarifier for the activated-sludge unit) and an add-on pilot scale unit (mixed media filter and activated carbon columns) were sampled for analysis of common waste water parameters and trace organic compounds. Four-day composites of daily samples were analyzed using capillary-column gas chromatography/mass spectrometry. The activated sludge unit removed aromatic compounds better than it did nonaromatics while the activated carbon unit was better at removal of nonaromatics. Average percentage removal of organics present in the DAF effluent was more than 99% for activated sludge, about 0% for mixed-media filter, and less than 1% for activated carbon. Eighty-one percent of the less than 1% of trace organics remaining in the final-clarifier effluent were removed by the activated carbon. These removal estimates are only approximate. (Small-FRC)
W79-06956

TREATMENT OF PACKINGHOUSE WASTEWATER BY INTERMITTENT SAND FILTRATION,
East Central Oklahoma State Univ., Ada.
M. L. Rowe.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 768, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-78-205, 1978. 71 p, 13 fig, 30 tab, 25 ref, 1 append.

Descriptors: *Filtration, *Waste water treatment, *Food processing industry, *Aerated lagoons, *Standards, Biochemical oxygen demand, Suspended solids, Coliforms, Ammonia, Oil.

The use of intermittent sand filters as a means of upgrading waste treatment systems for small packing houses was evaluated. The treatment system examined consisted of an extended aeration lagoon in series with an intermittent sand filter. A filter run of 109 days was observed with a hydraulic loading rate of 0.36 mgd and a sand source having an effective diameter of 0.35 mm and a uniformity coefficient of 2.5. The average BOD was 10.4 mg/liter and the average TSS was 11.1 mg/liter. When the 1983 BAT limitations were considered, the effluent met the maximum day limit for TSS but the 30-day average value for TSS was exceeded. The effluent met the limits for fats, oils, grease, and pH. The NH3-N in the effluent from the treatment system met the BAT limits which were recinded by the court. The fecal coliform limits were also exceeded. It was also determined that the small packinghouse managers should use a commercial laboratory when monthly or quaterly analyses are specified. REMOVAL OF HEAVY METALS FROM INDUSTRIAL WASTEWATERS USING INSOLUBLE STARCH XANTHATE,
Science and Education Administration, Peoria, IL. Northern Regional Research Center.
R. E. Wing, L. L. Navickis, B. K. Jasberg, and W. E. Rayford.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-283 792, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-78-085, 1978. 116 p, 20 fig, 55 tab, 69 ref.

Descriptors: *Polyelectrolytes, *Chemical precipitation, *Heavy metals, *Separation techniques, Copper, Ammonia, Sodium, Magnesium, Absorption, Ions, Sludge, Waste water treatment, Industrial wastes.

Insoluble starch xanthate (ISX) was found effective in bench-scale tests in the removal of heavy metal ions from several industrial effluent streams. ISX was applicable over the pH range of 3-11, in the presence of salt concentrations of 0-10%, and in batch or continuous flow systems. In the bench-scale tests, ISX in combination with alum reduced residual copper to less than 0.02 mg/liter without filtration in brass mill effluent. In lead battery waste water, residual lead decreased to less than 0.05 mg/liter with ISX treatment. The material also effectively removed copper ammonia complexes in circuit board copper etchant rinse waters. The ISX-metal sludge readily settles, dewaters to about 25-50% solids with filtration or centrifugation, and the ISX adds only sodium and magnesium ions to the treated water. Treatment processes were developed for removing copper from electroless copper plating and copper pyrophosphate electroplating rinse waters utilizing ISX. (Lisk-FRC)

CHARACTERIZATION OF REUSABLE MUNICIPAL WASTEWATER EFFLUENTS AND CONCENTRATION OF ORGANIC CONSTITUENTS,
Gulf South Research Inst., New Orleans, LA.
J. K. Smith, A. J. Englande, M. M. McKown, and S. C. Lynch.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 547, Price codes: A07 in paper copy, A01 in microfiche. Report EPA-600/2-78-016, 1978. 143 p, 18 fig, 53 tab, 10 ref, 1 append.

Descriptors: *Tertiary treatment, *Performance, *Water quality, *Standards, *Municipal wastes, Reverse osmosis, Ammonia, Nitrate, Phenols, Odor, Turbidity, Heavy metals, Potable water, Public health.

Organic concentrates were collected from operating advanced waste water treatment plants for use in health effects testing. After reverse osmosis, the organics were further concentrated and then recovered by liquid/liquid extraction. Also, chemical, physical, and biological analyses were conducted of effluent to determine how the quality of the effluents compared with drinking water criteria. All advanced treatment plants tested were characterized by high quality effluents. Spot samples taken over a six to nine month period at six plants determined that nitrogen (ammonia and nitrate), phenol, odor, carbon chloroform extract, turbidity, and specific heavy metals exceeded drinking water standards in most cases. The plants tested were: Lake Tahoe, California; Blue Plains, District of Columbia; Pomona, California; Dallas, Texas; Escondido, California; and Orange County, California. (Small-FRC)
W79-06966

IMPROVED TREATMENT OF LIME-SULFIDE TANNERY UNHAIRING WASTE.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 616, Price codes: A02 in paper copy, A01 in microfiche. Report 1977. 8 p, 2 tab.

Descriptors: *Waste treatment, *Tannery wastes, *Flocculation, *Hydrogen sulfide, *Flash distillation, Separation techniques, Industrial wastes.

lvancements in the treatment of lime-sulfide unring wastes from both salt-cured and unsalted les are discussed. Undissolved lime is flocculated t of the waste of salt-cured hide, and the superant is acidified to liberate hydrogen sulfide. drogen sulfide is flashed off under reduced pres-e at about 100 to 150F. Waste from unsalted les is sparged with carbon dioxide before floccuon, the sparged waste is flocculated with a ongly cationic polyelectrolyte, and the hydron sulfide flashed off from the acidified supernat liquid. RFORMANCE EVALUATION OF AN EXTING SEVEN CELL LAGOON SYSTEM,
ah Water Research Lab., Logan.
H. Reynolds, R. E. Swiss, C. A. Macko, and E. Middlebrooks.
ailable from the National Technical Information rvice, Springfield, VA 22161 as PB-273 533, ce codes: A08 in paper copy, A01 in microfiche. port EPA-600/2-77-086, 1977. 185 p, 29 fig, 49 , 46 ref, 5 append.

scriptors: *Oxidation lagoons, *Sewage lagoons, erformance, *Standards, *Biochemical oxygen mand, Coliforms, Suspended solids, Monitoring, ah, Design criteria, Design standards, Waste ter treatment, Sampling, Municipal wastes.

e performance of a seven cell faculative waste bilization lagoon system treating waste water m a population of 471 persons was evaluated l compared with federal and Utah effluent disarge standards. Sampling of the lagoon systems nsisted of: 24-hr composite raw influent samples; ividual pond effluent samples collected twice a ek for 13 months; and seasonal collections for 30 nsecutive day periods during the same 13 month riod. Samples were analyzed for BOD, soluble OD, suspended solids, volatile suspended solids, ODm soluble COD, alkalinity, ammonia-, nitrate-itrite-, and total Kjeldahl-nitrogen, total phosorus, and total algae count. Temperature, pH, solved oxygen, fecal coliforms, fecal streptocci, total coliform bacteria, daily influent and luent flowrates, air temperature, wind, evaporan, and solar radiation were also monitored. The ulting data indicated that the federal discharge ndard of 30.0 mg BOD/liter was met during the dy but that 85% BOD removal was not attained 4 of the 13 months studied. In 8 of the months, luent met the 10.0 mg/liter BOD and 10.0 mg/r suspended solids Utah standard. Effluent conned less than 30 mg/liter suspended solids 10 of 13 months but failed to meet the federal rerement of 85% suspended solids removal 5 of 13 months. State and federal fecal coliform els were consistently met. Loading on the oon system exceeded the design criteria and sign equations were not adequate for predicting erall performance. (Lisk-FRC)

N AGRO-POWER-WASTE WATER COMEX FOR LAND DISPOSAL OF WASTE EAT AND WASTE WATER,
nnsylvania State Univ., University Park. Inst. Research on Land and Water Resources.
R. DeWalle.
ailable from the National Technical Information rvice, Springfield, VA 22161 as PB-239 675, ce codes: A10 in paper copy, A01 in microfiche. port, 1974. 209 p, 49 fig, 49 tab, 55 ref, 1 append.

scriptors: *Ultimate disposal, *Application thods, *Sprinkler irrigation, *Thermal pollution, uclear power plants, Return flow, Land manement, Agriculture, Land use, Water cooling, il temperature, Soil moisture, Prototypes, Model dies, Equations, Waste water treatment, Municiwastes.

0.23 acre field prototype of an Agro-Powerste Water complex was utilized to evaluate the sibility of waste heat and water disposal on ricultural land. Municipal waste water was aped to the land by sprinkler irrigation and mained a high soil moisture content and thermal conductivity. Waste heat from power production was dissipated by circulating hot water through a pipe network imbedded in the land. Soil temperature, soil thermal conductivity, heat dissipation, degree of waste water treatment, soil surface temperature, and climatic conditions were monitored on the site. Test equations were developed from the data for predicting heat dissipation and surface temperature for use in a system analysis. Results of the analysis indicated that a 1,500 MWe nuclear electric plant would require 4,500 acres of land equipped with 2-inch diameter piping at a depth of 1 ft and spaced 2 ft apart in sandy soil. A nuclear fuel penalty concept was incorporated into a comparison of this system with conventional waste heat disposal systems. A cost analysis of the land disposal system indicated that it was less expensive than dry-cooling towers but more expensive than wet-cooling towers. (Lisk-FRC)

TECHNICAL ASSISTANCE PROJECT, TRINIDAD WASTEWATER TREATMENT FACILITY, TRINIDAD, COLORADO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 451, Price codes: A03 in paper copy, A01 in microfiche. Report, 1972. 39 p, 2 tab, 2 fig, 7 ref.

Descriptors: *Municipal wastes, *Aerobic treatment, *Operations, *Aeration, *Performance, Oxygen requirements, Waste water treatment, Management, Oxygen.

Operation of the Trinidad waste water treatment facility was evaluated; recommendations concerning plant limitations were made. Major limitations were the lack of an adequate oxygen supply to the aeration basins and aerobic digester, and lack of adequate aerobic digester sludge detention time. The quantity of oxygen supplied was determined to be only half of that required for optimum performance of the aeration basins and aerobic digester. The aerobic digester was determined to be only one-third of the required size at the present plant flow of 1 mgd. Other limitations are described. Recommendations include reconstruction or alteration of the influent channel to provide operators with a dry work area for repairs, a minimum of 70 mg/liter/hr of oxygen be supplied to the mixed liquor in the aeration basins and to the sludge in the aerobic digester, and the minimum detention time in the aerobic digester should be 25 days. LAND TREATMENT OF WASTEWATER IN SOUTHEASTERN MICHIGAN,
Michigan State Univ., East Lansing. Dept. of Crop and Soil Sciences.
B. G. Ellis, A. E. Erickson, B. D. Knezek, R. J. Kunz, and I. F. Schneider.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 125, Price codes: A09 in paper copy, A01 in microfiche. Report 1973. 226 p, 1 fig, 81 tab, 16 ref.

Descriptors: *Municipal wastes, *Waste water treatment, *Irrigable land, *Land use, *Application methods, Drainage, Percolation, Soils, Crops.

Data were assembled and interpreted in order to develop irrigation zones for waste water utilization by land application as an alternative effluent treatment method for Detroit. The principal crops that can be grown under irrigation include corn, navy and soybeans, wheat, alfalfa-brome hay, and to a lesser extent, sugar beets. Problems which may be encountered include percolation rate problems and drainage problems in fine-textured soils. For problem soils, 12.5 inches of water per acre is the maximum that can be applied. This application would be scheduled to offset the moisture deficit during the summer months. Application rates on sandy soils will be limited by phosphorus adsorbing capacity. If the phosphorus content is 7 ppm, the application rate sould be limited to 40 inches per year. The total application of water in the 25 counties of Southeastern Michigan is approximately 68 million acre inches per year. More than one-third of the potentially available area would have to be developed to treat Detroit area waste water. (Small-FRC)
W79-06971

EFFECTS OF FLOW EQUALIZATION ON THE OPERATION AND PERFORMANCE OF AN ACTIVATED SLUDGE PLANT,
Ypsilanti Township, MI.
G. W. Foess, J. G. Meenahan, and D. Blough.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 657, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-77-138, 1977. 95 p, 8 fig, 17 tab, 20 ref, 1 append.

Descriptors: *Pilot plants, *Activated sludge, *Flow characteristics, *Performance, *Costs, Biochemical oxygen demand, Suspended solids, Municipal wastes, Waste water treatment, Nitrogen, Phosphorus, Capital costs.

A pilot plant program evaluated the impact of flow equalization on the 14,000 cu m/day (3.7 mgd) upgraded activated sludge plant of Ypsilanti Township. Process streams were characterized under equalized and unequalized flow conditions with respect to BOD, COD, TSS, and forms of nitrogen and phosphorus. The equalization system functioned in a reliable manner throughout the study and was highly effective in leveling influent diurnal flow variations and providing a uniform daily flow rate to the activated sludge process. Reduction in the variances of BOD, TSS, COD, SOP, TP, and NH3-N across the equalization basin were in the range of about 20 to 80% based on concentration and 45 to 95% based on mass. Some biochemical action occurred in the basin, and there was an increase in suspended solids. BOD removal was marginal and inconsistent. Analysis of secondary effluent indicated that the effects of flow equalization were less important in determining effluent quality than the effects of other operational variables including organic loading intensity, sludge settleability, wind and density currents, recycle rate, sludge blanket height, chemical dose, etc. A cost analysis indicated that the capital costs associated with conversion of existing digesters to equalization basins were about 25% of new construction costs. No power cost economies occurred with flow equalization. (Small-FRC)
W79-06972

TREATMENT AND DISPOSAL OF WASTES PUMPED FROM SEPTIC TANKS,
Storrs Agricultural Experiment Station, CT.
J. J. Kolega, A. W. Dewey, B. J. Cosenza, and R. L. Leonard.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 656, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-77-198, 1977. 151 p, 57 fig, 24 tab, 41 ref, 9 append.

Descriptors: *Septic tanks, *Waste disposal, *Anaerobic digestion, *Aerobic treatment, *Land use, Performance, Biochemical oxygen demand, Chemical oxygen demand, Nitrogen, Laboratory tests, Pilot plants, Biological treatment, Costs.

Two approaches for treating and disposing of septage were developed and tested in laboratory and pilot plant studies: soil injection and anaerobic-aerobic series processes. These processes can sustain shock loadings and reduce concentrations of BOD, COD, and total Kjeldahl nitrogen by at least 93%. Most of the nitrogen is converted to nitrate. The combined treatment of septage and sewage in a conventional biological treatment plant was considered. The total cost of treating 1000 gal (3785 liters) of septage is about 18 times the cost for treating the same amount of raw waste water in a secondary treatment facility. Operating costs for treating septage in 10 mgd plants are about half the treatment costs in 1 mgd plants or at 1972 prices: $1.80/1000 gal ($0.48/1000 liters) as compared with $3.24/1000 gal ($0.86/1000 liters). (Small-FRC)
W79-06974

EVALUATION OF EXISTING SYSTEMS FOR LAND TREATMENT OF WASTEWATER AT MANTECA, CALIFORNIA, AND QUINCY, WASHINGTON,
Army Terrestrial Sciences Center, Hanover, NH.
I. K. Iskandar, R. P. Murrmann, and D. C. Leggett.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A045 126, Price codes: A04 in paper copy, A01 in microfiche. Report 1977. 34 p, 8 fig, 6 tab, 20 ref, 2 append.

Descriptors: *Waste water treatment, *Ultimate disposal, *Municipal wastes, *Land management, *Evaluation, Application methods, Leachate, Soil chemistry, Phosphorus, Nitrates, Nitrogen, Organic matter, Groundwater, Water quality.

Waste water disposal sites at Manteca, California, and Quincy, Washington, were evaluated for current performance and for the long-term impact of waste water application. These sites have been operated as slow-infiltration, land-disposal systems for up to 20 years. Water quality was used to evaluate current performance, and soil chemical parameters were measured to determine the effects of prolonged waste water application. Differences in pretreatment did not affect current performance. Differences in the performance of the two sites were due primarily to management practices, site history, and climatic differences. Leaching of nitrate was observed at both sites, but the impact on groundwater quality was within acceptable limits (<10 mg/liter of N03-N). Leaching of phosphorus was at both sites to a depth of 150 cm, but it was higher at Manteca. The higher level was due to crop management, land use, and mode and schedule of waste water applications. Total and extractable phosphorus increased in the surface soil levels with time. Soil nitrogen, on the other hand, appeared to decrease, probably due to mineralization. Soil organic matter and cation exchange capacity increased. There was an increase in exchangeable Na, but not enough to produce alkaline or saline conditions. A drop in soil pH after prolonged application was probably due to the removal of carbonates by leaching and by H(+1) from nitrification. Leachate quality, with proper management, should meet proposed EPA guidelines for drinking water. (Small-FRC)
W79-06975

TOC, ATP AND RESPIRATION RATE AS CONTROL PARAMETERS FOR THE ACTIVATED SLUDGE PROCESS,
Hillsboro Sewage Treatment Plant, OR.
C. Ortman, T. Laib, and C. S. Zickefoose.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 615, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-142, 1977. 60 p, 13 fig, 14 tab, 7 ref.

Descriptors: *Industrial wastes, *Activated sludge, *Respiration, *Aeration, *Oxygen demand, Carbon, Organic matter, Operations, Waste water treatment, Computer programs.

The feasibility of using TOC (Total Organic Carbon), ATP (Adenosine Triphosphate), and respiration rates as tools for controlling a complete mix activated sludge plant handling a significant amount of industrial waste, was investigated. A modified F/M ratio was the basis of the control methodology. This ratio was determined by calculating aerator organic loading based on waste water TOC concentration and microorganism concentration and/or activity by TOC and ATP of the activated sludge. Process control decisions were based on 5 to 7 determinations/day. The need for increased or decreased sludge aeration time was determined by respiration rates. Regulatory permit requirements were met when respiration rates were held between 8 to 20 mg O2/gm/hr and other parameters were in an optimum range. A programmable calculator was used to aid in process decisions. Operators could input plant data and instructions for process settings were generated. Functional programs included return rates, mode changes, wasting rates, respiration rate, and corrected settlometer volume. (Small-FRC)

FIELD PROTYPE DEMONSTRATION OF THE SWIRL DEGRITTER,
American Public Works Association, Chicago, IL.
R. H. Sullivan, J. E. Ure, and P. Zielinski.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 668, Price codes: A05 in paper copy, A01 in microfiche. Report EPA-60012-77-185, 1977. 64 p, 32 fig, 29 tab, 4 ref, 1 append.

Descriptors: *Waste water treatment, *Separation techniques, *Suspended solids, *Evaluation, *Centrifugation, Costs, Maintenance, Domestic wastes, Storm runoff, Urban runoff.

A 1.8 m diameter swirl degritter designed for a flow of 65.6 liter/sec (1.5 mgd) was evaluated. When tested with sanitary domestic waste water, the swirl unit performed at slightly less efficiency than the conventional aerated grit unit which was operating at less than twice the normal flow-through rate. The characteristics of the grit removal from the swirl degritter were excellent; particles of 0.2 mm diameter were removed. Three Chasick sampling units analyzed grit removal. When blasting sand was added to provide extremely high concentrations of 0.2 mm particles, the unit efficiently removed the particles. The degritter could be used for domestic waste water, combined sewer overflows, or urban stormwater runoff treatment. The lack of moving parts in the basic unit and the unit's small size make it attractive for many applications. An analysis of construction, operating, and maintenance costs for a twenty year life indicated that the swirl degritter is 26 to 38% less costly than the conventional aerated grit chamber. DEVELOPMENT EFFORT TO DESIGN AND DESCRIBE PINK WATER ABATEMENT PROCESSES,
Westgate Research Corp., Los Angeles, CA.
F. C. Farrell, J. D. Zeff, T. C. Grase, and D. T. Boylan.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A045 126, Price codes: A04 in paper copy, A01 in microfiche. Report 1977. 63 p, 11 fig, 8 tab, 1 append.

Descriptors: *Industrial wastes, *Waste water treatment, *Ozone, *Ultraviolet radiation, *Pilot plants, *Performance, Design, Capital costs, Operating costs, Annual costs.

A pilot plant test program was carried out to obtain design, operating, and cost information needed to develop a 5000 gpd pilot plant for pink water abatement. A 1000 gpd ULTROX pilot plant (UV-ozone) was used. TNT in tap water equivalent in content to ARRADCOM pink water was used to establish minimum power/residence time operating conditions. Final tests were made on pink water shipped from ARRADCOM. The 5000 gpd pilot plant reactor should have a wet volume of 625 gal and will require up to 37.5 lb of ozone/day and 144, 65 watt UV lamps. There should be a maximum of six reaction stages. Preliminary design drawings have been made of the pilot plant. Overall assembly, reactor assembly, and UV wiring schematic prints are presented along with specifications on standard ozone generators. A program is presented for developing the 5000 gpd pilot plant including the costs involved. Capital costs for a 100,000 gpd ULTRX system to remove 140 ppm TNT and 70 ppm RDX from pink water effluent to <1 ppm TNT and <1 ppm RDX are estimated at $432,000. Annual operating costs are estimated at $87,5000. Total direct cost/1000 gal is $2.50. (Small-FRC)
W79-06978

AN EVALUATION OF THE ENGINEERING DESIGN PARAMETERS OF HYDROGEN PEROXIDE, ULTRAVIOLET OXIDATION OF REFRACTORIES IN WASTE WATER,
Naval Academy, Annapolis, MD.
W. A. Barr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A045 351 Price codes: A02 in paper copy, A01 in microfiche Report, 1976. 14 p, 5 fig, 1 tab.

Descriptors: *Industrial wastes, *Waste water treatment, *Oxidation, *Ultraviolet radiation, *Performance, Design, Reflectance, Energy, Acids.

Design data were determined for the application of ultraviolet hydrogen peroxide treatment to waste water. Tests with acetic acid indicated that the most difficult refractories in waste water can be oxidized completely with hydrogen peroxide in the presence of ultraviolet radiation. The design of the oxidizing chambers can minimize the treatment time or the energy required per unit volume of the reactants. In an investigation of the ultraviolet radiation reflectivity of the reactor chamber walls using aluminum surfaces and galvanized steel, the reflectivity did not affect the rate at which the oxidation occurred. Design data are needed on equipment to oxidize refractories other than acetic acid. (Small-FRC)

DES MOINES 208 AREAWIDE WASTE TREATMENT MANAGEMENT PLAN.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 305 Price codes: A14 in paper copy, A01 in microfiche Report 1977. 88 p, 9 fig, 15 tab, 41 ref, 4 append

Descriptors: *Municipal wastes,*Waste water treatment, *Sludge disposal, *Sewage treatment *Sewerage, Combined sewers, Infiltration, Filtration, Aeration, Urban runoff, Agricultural runoff, Water quality, Land use, Environmental effects

A plan is proposed for the Des Moines Metropolitan Area waste treatment which includes nonstructural and structural programs for the control of point, intermittent point, and nonpoint sources. Point source actions include the construction of a waste water collection system with minimum infiltration and construction of a new sewage treatment plant with an activated biofilter unit and supplemental aeration. Dewatered anarobic sludge will be applied to agricultural land or disposed at the Metropolitan landfill. Intermittent point source controls include segregation of combined sewers and the installation of flow separators at selected combined and storm sewer discharge points. Nonpoint source controls include reducing pollution from cropland runoff, construction sites, and unincorporated areas. The proposed plan will significantly improve water quality and will eliminate water quality violations under wet and dry weather conditions. Adverse impacts include fugitive dust emission, noise, disturbance of vegetation and wildlife, and disruption of land use during construction. During operation of the treatment facilities, the generation of sludge is the major adverse impact. Alternatives include alternate methods of waste water treatment, alternate sludge disposal and treatment methods, and alternate subplans for minimizing point, intermittent point, and nonpoint pollution sources. ACTINOMYCETES OF SEWAGE-TREATMENT PLANTS,
Rutgers - The State Univ., Piscataway, NJ. Waksman Inst. of Microbiology.
H. A. Lechevalier, M. P. Lechevalier, and P. E. Wyszkowski.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 589 Price codes: A05 in paper copy, A01 in microfiche Report EPA-600/2-77-145, 1977. 89 p, 6 fig, 15 tab 5 ref.

Descriptors: *Actinomycetes, *Activated sludge *Anaerobic digestion, *Foaming, *Sewage treatment, Sewage bacteria, Toxicity, Settling basins Aeration, Foam separation.

Methods of controlling actinomycetic foaming in the secondary aeration and settling tanks of four

ivated sludge sewage treatment plants were luated. The formation of Nocardia-rich foam in secondary aeration tanks is considered a health zard due to the formation of Nocardia-contain- aerosols as well as a cause of reduced treatment ciency and increased labor. The supernatant m anaerobic digesters, previously thought to ntain suspended solids that were toxic to Nocar-, was not toxic for all bacteria. The study at- npted to control foaming in four sewage treat- nt plants equipped with anaerobic digesters by urning supernatant from the digesters to the mary treatment system. Nocardia presence was ermined visually and by gas chromatography ection of nocardomycolic acid in the suspended ids. The results of the studies indicated that cardia-infected foams should be discharged to anaerobic digester and nocardiotoxic material uld be added to the activated sludge reactor. A dy of the chemical nature of the nocardiotoxic npounds was also recommended. (Lisk-FRC)

ROGENIC ACTIVITY OF CARBON-FIL-RED WATERS,
xas A and M Univ., College Station.
W. Wolf, B. J. Camp, and S. J. Hawkins.
ailable from the National Technical Information vice, Springfield, VA 22161 as PB-293 172, ce codes: A06 in paper copy, A01 in microfiche. port EPA-600/1-79-009, 1979. 112 p, 14 fig, 20 , 11 ref, 4 append.

scriptors: *Activated carbon, *Filtration, *Per-mance, *Waste water treatment, *Water purifi-ion, Potable water, Activated sludge, Coli-ms, Microorganisms, Toxicity, Carbon, Organic tter, Correlation analysis, Public health.

e endotoxin content and pyrogenic response of nular activated carbon (GAC) filtered waters re studied. GAC-filtered secondary effluent m an activated sludge pilot plant contained free lotoxins in the range 6-250 micrograms/liter lding positive pyrogenic responses in 18 of 20 ls. Samples were obtained from 27 different plies that utilize GAC adsorption and were nd to contain free endotoxin ranging from 1.2- micrograms/liter, but none gave a pyrogenic ponse. No relationship was found between en-oxin content and pyrogenic response. GAC ls which had been in operation in water treat-nt plants without regeneration for as long as 110 nths, removed small amounts of total organic bon (TOC). Of these, however, 5 of 28 samples wed an increase in TOC through GAC and 8 of samples showed an increase in standard plate nt. None of the 28 contained coliforms, but one 25 yielded pseudomonads. Good correlations re observed on non-disinfected AWT effluent mples between standard plate count and total lotoxin (r=0.945), standard plate count and free lotoxin (r=0.932), and total coliforms and free lotoxin (r=0.939). Good correlations were not erved in assaying AWT samples that had been ject to the disinfecting procedures of chlorima-n, ozonation, pH or UV irradiation. Thus, pyro-genicity was demonstrated for AWT effluents but not for GAC-processed drinking waters. (Small-FRC)

ELECTRODIALYSIS FOR CLOSED LOOP CONTROL OF CYANIDE RINSE WATERS,
International Hydronics Corp., Princeton, NJ.
G. W. Bodamer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 688, Price codes: A03 in paper copy, A01 in microfiche. Report EPA-600/2-77-161, 1977. 34 p, 5 fig, 10 tab.

Descriptors: *Industrial wastes, *Electrodialysis, *Metallurgy, *Recycling, *Performance, Salts, Anions, Waste water treatment.

Full-scale trails were conducted of electrodialysis of brass plating rinse solutions. The system was designed to deplete dissolved salts in the rinse waters, yielding water suitable for re-cycle to the rinsing operations and returning the salts to the plating bath. Zero discharge would be achieved. The system was only about one-fourth as effective as had been expected. Earlier work successfully used electrodialysis to treat sodium copper cyanide rinse water. The inefficiency appeared to be due to a reduction in perm-selectivity of the anion membranes as a result of retention of an insoluble zinc compound or of a tightly absorbed zinc complex anion. No remedy could be found for the situation which did not affect the chemistry of the plating bath. Small-scale, preliminary tests are recommended for future applications of this promising technique. W79-06993

FULL-SCALE OPERATION OF A SINGLE-STAGE NITRIFICATION-DENITRIFICATION PLANT,
Owego Town, NY.
D. E. Schwinn, D. F. Storrier, and D. G. Thorne.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 728, Price codes: A05 in paper copy, A01 in microfiche. Report EPA-600/2-77-088, 1977. 73 p, 14 fig, 13 tab, 12 ref.

Descriptors: *Municipal wastes, *Waste water treatment, *Nitrification, *Denitrification, *Performance, Design, On-site testing, Aeration, Biochemical oxygen demand, Suspended solids, Costs.

A single-stage nitrification-denitrification process was operated full-scale to determine process feasibility and reliability, necessary design features, and operating techniques to ensure optimum performance. The test plant was selected because waste water temperatures ranged from 8 to 22C, and nitrification-denitrification can be difficult to operate under extremely cold waste water temperatures. Alternating aerobic-anoxic conditions were achieved in completely mixed reactors by the on-off cycling of mechanical aerators. Nitrogen removals from 76 to 86% were accomplished with hydraulic retention times of 13 to 27 hr. BOD and suspended solids reductions were above 90%. Nitrogen removal was reduced to 67% for a 2-3 week period in the summer because of excessive solids inventory but was restored by reducing solids inventory. Thus, nitrogen removal can be achieved in many existing plants at little or no capital cost by implementing single-stage nitrification-denitrification if the design conditions and waste water characteristics are favorable. PRETREATMENT AND SUBSTRATE EVALUATION FOR THE ENZYMATIC HYDROLYSIS OF CELLULOSIC WASTES,
Army Natick Research and Development Command, MA. Food Sciences Lab.
L. A. Spano, T. H. Tassinari, C. F. Macy, and E. D. Black.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 104, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/7-77-038, 1977. 41 p, 11 fig, 6 tab, 64 ref, 2 append.

Descriptors: *Pulp and paper industry, Industrial wastes, *Sludge treatment, *Cellulose, *Performance, Wood wastes, *Hydrolysis, *Enzymes, Ammonia, Laboratory tests, Solid wastes.

The applicability of various treatment methods and existing cellulosic wastes to a process for the conversion of cellulose to glucose and other reducing sugars, was investigated. Pulp and paper mill primary sludge waste was evaluated, and the following four pretreatments were investigated: modified hydropulping, two-roll milling, attritor milling, and anhydrous liquid ammonia. Attritor milling significantly increased the susceptibility of newspaper, cotton, and wood chips was effective in enhancing susceptibility to enzymatic hydrolysis. This was accomplished using 3, 6, and 10 inch diameter mills. Data indicate that large-scale mills using short processing times and high loadings may be possible. Anhydrous liquid ammonia treatment of cellulosic materials offers the potential of a chemical process in which the pretreating agent can be recycled. Materials originating from hardwood sources are more amenable to ammonia treatment than those from softwoods. Two-roll milling followed by treatment with anhydrous liquid ammonia is a possibility. Optimum equipment design, energy requirements, processing techniques, and other system variables require extensive investigation. (Small-FRC)

PLANT EVALUATION AT FISHING BRIDGE WASTEWATER TREATMENT PLANT, YELLOWSTONE NATIONAL PARK,
Environmental Protection Agency, Denver, CO. Region VIII.
O. K. Boe, and L. Malloy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-278 177, Price codes: A03 in paper copy, A01 in microfiche. Report, 1977. 26 p, 8 fig, 3 tab.

Descriptors: *Waste water treatment, *Municipal wastes, *Personnel, *Seasonal, *Performance, Design, Training, Denitrification, Toxicity.

Operations evaluations were conducted at the Fishing Bridge waste water treatment facility, and deficiencies were noted. The plant design is described. Problems were identified with process control. Generally, the plant operators were seasonal employees, and training in plant operations was seen as necessary. Also, emphasis on detailed daily logs of operation conditions and trend charts, was stressed for future operation. There were some problems with denitrification. After additional training of personnel, the oxidation ditch effluent BOD and total suspended solids level were expected to improve. Toxic substances were to be eliminated from the sewer system. If problems continue with denitrification, surface skimmers may need to be installed on the final clarifier. (Small-FRC)

REMOVAL AND RECOVERY OF SULFIDE FROM TANNERY WASTEWATER,
The Blueside Co., Inc., St. Joseph, MO.
R. H. Sayers, and R. J. Langlais.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 872, Price codes: A07 in paper copy, A01 in microfiche. Report EPA-600/2-77-031, 1977. 129 p, 18 fig, 29 tab, 20 append. 4 append.

Descriptors: *Tannery wastes, *Sulfides, *Adsorption, *Costs, *Recycling, Acids, Hydrogen ion concentration, Coagulation, Proteins, Settling basins, Waste water treatment, Industrial wastes.

A full-scale sulfide reclamation plant was constructed to investigate the feasibility of removing and recovering the sulfides in cattlehide tannery waste water. The combined tannery effluent from the soaking, unhairing, bate, pickle, and chrome tanning wastes from the tannery producing 25,000 hides per week, was screened and clarified. The

clarified effluent was pumped continuously to a degasifier in which acidification to a pH of 5.0-5.5 was effected using sulfuric acid. The hydrogen sulfide liberated from the waste water is adsorbed in recirculating caustic soda until a desired sodium sulfide concentration was achieved. The sodium sulfide is reused in the tannery's unhairing process. Using sulfide reclamation, a savings in material and freight costs was realized of approximately $92,052 per year or $84.84 per month per 1000 hides. The acidification of the total tannery waste water also results in the coagulation of the solubilized proteins which could be removed by secondary sedimentation. This would result in a sizeable reduction of the pollution load and the related sewer surcharge. (Small-FRC)

IMPACT OF NITRILOTRIACETIC ACID (NTA) ON AN ACTIVATED SLUDGE PLANT - A FIELD STUDY,
Department of Fisheries and Environment, Ottawa (Ontario). Wastewater Technology Centre.
N. Wei, R. Stickney, P. Crescuolo, and B. P. LeClair.
Canada-Ontario Agreement on Great Lakes Water Quality, Ontario Ministry of the Environment, Pollution Control Branch, Toronto, Ontario, Canada, Research Report No. 91, 1979, 37 p, 9 fig, 20 tab, 24 ref. 71-3-3.

Descriptors: *Nitrilotriacetic acid, *Activated sludge, *Phosphorus, *Heavy metals, Sewerage, Treatment facilities, Biochemical oxygen demand, Microorganisms, *Diurnal variation.

A field study on the effects of nitrilotriacetic acid (NTA) on activated sludge was carried out at the Waterdown Water Pollution Control Plant, from January, 1972 to April, 1973. The Waterdown Plant is a conventional activated sludge plant with a design of 1 362 cu. m. per d. The nominal wastewater flow was approximately 45% of design capacity and all homes served by the sewer system were within a mile and a half of the treatment plant. The areas investigated in the study include: degradation of NTA, effect of NTA loading on chemical treatment for phosphorus removal, NTA loading and heavy metal removal in the treatment plant, and effect of NTA loading on treatment plant operation. The NTA was added to the treatment plant in the form of Sunlight Soap (a commercial laundry detergent containing 20 wt % NTA) at two rates to approximate NTA spiking levels of 8 mg per L NTA and 16 mg per L NTA. The background NTA loading in the raw wastewater averaged 2.5 mg per L NTA. Diurnal variation studies of the NTA loading showed peak values of 12 mg per L NTA in the afternoon and minimum values of 0.1 mg per L NTA at night. The raw wastewater had an average BOD5 of 100 mg per L, a suspended solids of 150 mg per L, and a total phosphorus loading of 6.0 mg per L P. Heavy metal levels averaged 0.2 to 0.5 mg per L for zinc, aluminum and iron, and 0.01 to 0.2 mg per L for lead, nickel and copper. The treatment plant efficiency averaged 86% BOD5 and 85% suspended solids removal throughout the study. (WATDOC)

IMPACT OF WASTES FROM A WATER TREATMENT PLANT: EVALUATIVE PROCEDURES AND RESULTS,
Illinois State Water Survey, Urbana.
R. L. Evans, D. H. Schnepper, and T. E. Hill.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 040, Price codes: A03 in paper copy, A01 in microfiche. Circular 135, 1979. 39 p, 17 fig, 10 tab, 11 ref, 1 append.

Descriptors: *Water treatment, *Sludge disposal, *Illinois, *On-site investigations, Water quality, Data collections, Water sampling, Analytical techniques, Methodology, Water purification, Evaluation, Streams, Environmental effects, Waste disposal, Waste assimilative capacity, Surface waters, Water properties, Chemical properties, *Pontiac(IL), *Vermilion River(IL).

This report summarized the procedures used and the results obtained in assessing the effects on a stream in Illinois of waste discharges from a water treatment plant that employs the clarification process. The water treatment plant serving Pontiac, Illinois, is located on the bank of the Vermilion River, the source of water for treatment. About 1,000 feet downstream of the plant intake is a dam which forms a pool with a maximum water depth of about 8 feet and width of 140 feet at normal pool stage. Wastes from the plant are discharged into the pool about 120 feet downstream of the water intake. The findings were reported here in 3 sections, i.e., the water treatment plant study, chemical characteristics of the stream, and biological characteristics of the stream. There was also a concluding section. All pertinent data developed during the course of the study were included in the appendix. The experience gained during the course of this work confirms the basic principle that the waters of a stream possess the capability of assimilating waste without significant degradation in water quality for normal usage. This capability is a function of stream geometry, flow, upstream water quality, and the characteristics and magnitude of the waste load. At the sites of water plants treating surface waters in Illinois, these relationships are variable. Because of this variability, an intelligent examination at each site is necessary to permit rational decisions governing the impact of waste on water quality. This study may be useful for such examinations. (Humphreys-ISWS)

SEWAGE SLUDGE ENTRENCHMENT SYSTEM FOR USE BY SMALL MUNICIPALITIES,
Science and Education Administration, Beltsville, MD. Biological Waste Management and Soil Nitrogen Lab.
J. M. Walker, L. Ely, P. Hundemann, N. Frankos, and A. Kaminski.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 662, Price codes: A05 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-018, February 1978. 82 p, 29 fig, 23 tab, 8 ref. EPA-IAG-D4-0510.

Descriptors: *Waste disposal, *Sludge disposal, *Landfills, *Ultimate disposal, *Municipal wastes, Trenches, Sludge treatment, Lime, Heavy metals, Water pollution sources, Land use, Solid wastes, Equipment, Economics, Costs.

A method was developed whereby small municipalities can economically entrench without odor or surface water runoff 3 to 48 tons/day of freshly dewatered sewage sludge containing 15 to 25% solids. The readily available, relatively inexpensive equipment included a tractor equipped with a loader and backhoe and a dump truck or concrete mixer truck; a tractor operator and a truck driver were required. Trenches dug with the backhoe were 60 cm wide, 60 cm deep and 60 cm apart. One hour was required to entrench 12 tons of dewatered sludge. The estimated cost of sludge incorporation excluding land cost but including equipment, personnel, hauling 32 km each way, drainage, monitoring and final land cultivation was less than $15/dewatered ton. For reuse of previously entrenched sites a minimal time lapse of two years is sufficient when the previously entrenched sludge has been satisfactorily dewatered. To reduce the potential for metals moving through soils and becoming available to plants, liming the sludge prior to dewatering and entrenchment is recommended. This method is not appropriate in some prime agricultural land, because of the subsoil brought to the surface and the relatively large amount of heavy metals being applied. Entrenchment is appropriate when sludges cannot be land spread; however, it is a resource-wasteful practice with the potential for polluting groundwater by nitrate nitrogen leaching. (Davison-IPA)
W79-06947

DISPOSAL OF SEWAGE SLUDGE INTO A SANITARY LANDFILL,
R. Stone.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 680, Price codes: A20 in paper copy, A01 in microfiche. Report EPA-S-801582, 1974. 417 p, 69 fig, 92 tab, 99 ref, 7 append.

Descriptors: *Ultimate disposal, *Municipal wastes, *Sewage sludge, *Landfills, *Performance, Pilot plants, Leachate, Absorption, Odor, Lysimeters.

The disposal of liquid sewage sludge and septic tank pumping into solid waste at a sanitary landfill was investigated in a three-year demonstration project. Benchscale laboratory studies determined the moisture-absorbing capacity of typical solid wastes. Pilot plant lysimeters were used to investigate the effects of sewage and septic tank sludges on solid waste temperature, decomposition, leachate, settlement, insects, odor, and gas characteristics. Full-scale demonstration landfill operation studies were conducted with up to 100% sludge disposal. The solid waste had sufficient ability to absorb moisture and no runoff was produced. Full-scale sludge disposal was economically feasible and produced no leachate. Benefits included increased landfill compaction, greater density, and reduced blowing litter and dust. Problems with the system included odors following raw sludge or septic tank pumpings disposal and bird foraging. (Small-FRC)
W79-06965

STRONG OXIDANT CONDITIONING OF ALLENTOWN WASTEWATER SLUDGE,
Allentown Urban Observatory, PA.
P. J. Usinowicz, and J. F. Stine.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-278 681, Price codes: A03 in paper copy, A01 in microfiche. Report UO-LCCM-ALL-010, 1977. 39 p, 1 fig, 22 tab, 14 ref, 2 append.

Descriptors: *Sludge treatment, *Dewatering, *Ozone, *Ultimate disposal, *Oxidation, Municipal wastes, Lime, Performance, Costs, Waste water treatment.

Hydrogen peroxide and ozone were evaluated as sludge conditioning agents at the Allentown Wastewater Treatment Plant using anaerobically digested sludge. Combinations of hydrogen peroxide, ferric chloride, and lime were tested. Hydrogen peroxide addition was inconsistent in increasing dewaterability, but lower doses between 200 mg/liter to 500 mg/liter were most effective in sludge dewatering improvement when sludge solids were less concentrated, around 30 g/liter. At sludge solids concentrations around 40 g/liter or more, hydrogen peroxide treatment was not effective; in some cases, it was counterproductive. Effective ozone doses were 25 mg/liter to 100 mg/liter when combined with ferric chloride and lime. Higher doses were ineffective. The use of these strong oxidants increased soluble filtrate strength; however, effective conditioning under any chemical application increased soluble filtrate strength. Both oxidants could be applied sucessfully to Al-

own Wastewater Treatment Plant sludge. Suc-
s, however, depends on sludge solids concentra-
s being low (around 30 g/liter). An economic
lysis indicated that hydrogen peroxide doses
e not economically competitive even when
d in combinations with ferric chloride and lime.
ne was competitive. (Small-FRC)

ipment, Electric equipment, Gravity flow,
table equipment.

e primary object of this invention is to provide a
-contained purification apparatus capable of re-
ly destroying microorganisms in raw water,
ich is portable, foolproof, and automatic in its
eration. The appratus described is independent
external energy sources although it may use
m where available. The casing of the apparatus
loses a chamber and is formed with two orifices
ced from the chamber in opposite directions but
nected to the chamber to allow gravity flow of
water from one of the orifices, through the
mber, and out of the other orifice. Two elec-
des mounted in the chamber for flow of the
ter between them are conductively connected
an electric battery by circuitry which causes
rent to flow between the electrodes through the
ter when the water and the battery satisfy
per conditions for the functioning of the appa-
us, such conditions being indicated by a sensible
al. A compartment in the casing, sealed from
electrode chamber, encloses almost all the cir-
try and the battery. (Sinha-OEIS)

ELECTROLYTIC CELL FOR TREATMENT OF WATER,
J. Miller.
U.S. Patent No. 4,119,518, 12 p, 8 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 975, no 2, p 665, October 10, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, *Water pollution treatment, Disinfection, Electrolysis, Electrodes, Equipment, Cleaning.

An electrolytic cell for the treatment of water comprises a closed container with a lower inlet opening and an upper outlet opening for the water and at least two electrodes which are adapted to be connected with the positive and negative poles of a DC source. In the interior of the electrolytic cell particles are located whose density is higher than that of water and which are prevented by gratings from emerging from the electrolytic cell. The gratings are arranged in front of the lower water inlet opening and the upper water outlet opening. The openings are smaller than the diameter of the particles. The electrolytic cell particles whose density is higher than that of the water are caused to eddy by the inflowing water. Owing to impingement and friction of the individual particles on the electrodes the eddying brings about mechanical cleaning of the electrodes and improves the electrical conductivity of the water to be treated. (Sinha-OEIS)
W79-06622

WATER PURIFICATION DEVICE,
Lever Bros Co., NY. (Assignee).
B. H. Bory, and A. B. Kessler.
U.S. Patent No 4,133,754, 13 p, 4 tab, 6 ref; Official Gazette of the United States Patent Office, Vol 978, No 2, p 613, January 9, 1979.

Descriptors: *Patents, *Water treatment, *Water purification, *Water pollution treatment, Activated carbon, Inhibitors, Filtration, Domestic water, Equipment.

A device for the purification of water and methods for its use are disclosed. The device is made of a closed, porous, non-woven fabric container containing granular activated carbon as the water purification agent where the fine particles of the carbon are prevented from migrating through the container when the device is immersed in water. It was found that certain chemically unrelated substances could be dispersed or mixed in with the granular activated carbon for preventing the fines of carbon from migrating through the porous container when contacted with water. It was also discovered that these inhibitor ingredients or agents would not substantially contribute any adverse flavor of their own to the treated water. These ingredients include certain mildly inhibited amylose-containing starches, wood flour and a substantially pure aluminum lanolate referred to as 'inhibitors' or 'inhibiting agents'. (Sinha-OEIS)
W79-06631

SUBMERGED SETTLER FOR SUSPENDED SOLIDS,
E. S. Posgate.
U.S. Patent No. 4,133,761, 10 p, 7 fig, 14 ref; Official Gazette of the United States Patent Office, Vol 978, no 2, p 615-161, January 9, 1979.

Descriptors: *Patents, *Water treatment, *Water quality control, Water purification, Turbidity, Settling basins, Suspended solids.

A water treatment plant extracts water from a large open main body of water into a settling enclosure submerged in the main body of water. The settling chamber is isolated from the main body of water by an enclosure wall. Input passages admit water to the settling chamber and output passages convey water from the quiescent body of water to the water treatment plant. Water entering the settling chamber is held in a substantially quiescent state for a period of time sufficient to ensure that the turbidity of water drawn from the quiescent body is substantially constant and unaffected by turbidity conditions in the main body of water. (Sinha-OEIS)
W79-06633

AN AUTOMATIC CHLORINATION SYSTEM FOR ELIMINATING BIOLOGICAL GROWTH IN PUMPING SYSTEMS FOR AUTOMATIC INSTRUMENTATION,
Environmental Monitoring and Support Lab., Cincinnati, OH. Instrumentation Development Branch.
R. P. Lauch.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 081, Price codes: A03 in paper copy, A01 in microfiche. Report No. EPA-600/4-78-010, January 1978. 33 p, 6 fig, 12 tab, 5 ref, 3 append.

Descriptors: *Chlorination, *Water purification, *Automation, *Microorganisms, Water quality control, Water treatment, Water pollution sources, Dissolved oxygen, Chemical reactions, Pipelines.

An investigation was undertaken to determine whether automatic chlorination could eliminate microbial growth or slime in monitor pumping systems. Dissolved oxygen (DO) was the parameter used to determine sample change within the pumping system because it is easily and accurately measured. A decrease in DO results from microbial metabolism; therefore, it must be noted that other less conspicuous parameters may also be changing. The automatic system described periodically chlorinates the lines to remove the slime microbes. It was evaluated during warm and cold weather to determine the optimum quantity and frequency of chlorination. The results of the field tests show that automatic chlorination is effective for eliminating slime from the inner pipeline surfaces of pumping systems for automatic instrumentation. The minimum daily quantity of chlorine required to keep DO change minimal was a gaseouschlorine feed rate of 2 to 2 1/2 lbs/day. DO samples collected across the pumping system 23 hours after the chlorination cycle yielded an average DO-change of zero. The optimum chlorine concentration and frequency of chlorine addition to the system were determined during the summer months when microbial growth was at a maximum. (Davison-IPA)
W79-06789

CHARACTERIZATION OF REUSABLE MUNICIPAL WASTEWATER EFFLUENTS AND CONCENTRATION OF ORGANIC CONSTITUENTS,
Gulf South Research Inst., New Orleans, LA.
J. K. Smith, A. J. Englande, M. M. McKown, and S. C. Lynch.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 547, Price codes: A07 in paper copy, A01 in microfiche. Final Report No. EPA-600/2-78-016, February 1978. 142 p, 18 fig, 62 tab, 10 ref, 1 append. 68-03-2090.

Descriptors: *Effluents, *Tertiary treatment, *Public health, *Water quality, *Potable water, *Water quality standards, *Water reuse, Waste treatment, Organic compounds, Heavy metals, Ammonia, Nitrates, Phenol, Odor, Turbidity, Water analysis, Sampling, Chemical analysis, Biological properties, Physical properties, Chemical properties, Reverse osmosis.

The major objective of this project was to collect organic concentrates from Advanced Wastewater Treatment (AWT) plants to be used in health effects testing. The first stage of concentration utilized a reverse osmosis process; liquid/liquid extraction was used to further concentrate the organics. The following pilot and fully operational AWT plants were selected for evaluation because of availability and because effluent quality exceeded that of secondary treatment systems: Lake Tahoe, Pomona, Escondido, and Orange County in California; Dallas, Texas; and Blue Plains, District of Columbia. In determining how the quality of the effluents from these systems compared with current drinking water regulations, chemical, physi-

cal, and biological analyses were conducted. Although AWT systems were not designed to produce potable water, all were characterized by high quality effluents. Spot samples taken over a six to nine month period indicatd that nitrogen (ammonia and nitrate), phenol, odor, carbon chloroform extract, turbidity, and specific heavy metals in most of the treated effluents exceeded drinking water regulations. (Davison-IPA)

RIDDING GROUNDWATER OF HYDROGEN SULFIDE. PART 2,
Lochrane Engineering Co., Orlando, FL.
T. G. Lochrane.
Water and Sewage Works, April 1979, p 66-70. 2 fig, 9 tab, 1 ref.

Descriptors: *Groundwater, *Water treatment, *Hydrogen sulfide, *Aeration, Chlorination, Optimization, Water analysis, Water sampling.

Optimum aeration for removal of H2S from groundwater depends on how well the system parameters are known. Filtration is considered to most accurate method for determining H2S concentration. The pH level is measured with a pH probe. Two grab samples, aerated and nonaerated, were collected at specific locations to determine treatment effectiveness. Analysis of these samples showed a first-order reaction for H2S removal. Using the calculated reaction rates and contact time for each aerator, a relationship was plotted for the theoretical contact times required at different hydrogen sulfide removals. These contact times formed the basis of a cost analysis between aeration and chlorination. The combined costs at different percentages of H2S removed identified the most cost-effective removal percentage for combined aeration and chlorination treatment methods. Aerator performance can be improved by increasing agitation in the trays, increasing detention time, and adding a weak acid to lower the pH and increase the H2S gas-phase prior to aeration. SOUTH COASTAL WATER QUALITY MANAGEMENT PLAN, 1975.
Massachusetts Div. of Water Pollution Control, Westborough.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 317, Price codes: A05 in paper copy, A01 in microfiche. Massachusetts Water Resources Commission, Westborough, Publication No. 8402-85-25-9-75-CR, September 1975. 15 fig, 9 tab, 11 ref.

Descriptors: *Regional planning, *River basins, *Resources, *Water quality standards, *Water pollution, *Water pollution abatement, *Massachusetts, *Cape Cod Bay(MA), Water quality, Biochemical oxygen demand, Fecal coliform, Storm runoff, Agricultural runoff, Nonpoint pollution, Stream/segment classification, Abatement programs, Landfills, Discharge permits, Dissolved oxygen, Hydrogen ion concentration.

The South Coastal Planning Area is located southeast of Boston, includes the towns of Kingston, Plymouth, and Plympton, and is specifically concerned with the waters of these towns which drain to Cape Cod Bay. The report describes the legal provisions in setting up a basin under PL 92-500, the existing water quality problems and standards in the south coastal basin, the abatement program, the sources of nonpoint pollution, the assessment of municipal needs, and the relationship of a water quality plan to other regional plans. The basin plan establishes constraints for waste discharges through the determinants of waste load allocations. The abatement program includes a discharge permit program which establishes effluent limitations and schedules for corrective actions. The permits issued in the south coastal area cover the period through July 1, 1977, and the requirements for these permits are presented. Inherent to the goals of the basin plan are the reclassifications of the waters of the South Coastal Basin. The process and specific recommendations are contained in the report, along with an outline of the monitoring program to determine whether these goals are being achieved. The goals of the monitoring program are: (1) to assure that permit conditions are met at all treatment facilities; (2) to assure that required abatement projects result in the desired water quality; and (3) to locate any new or unknown pollution problems in the basin. Priority water quality areas are established for the planning jurisdiction, and each area is assigned a severity ranking. An appendix presents a summary of public participation activities involved in producing the South Coastal Water Quality Management Plan. (Coan-NC)

NITROGEN AND PHOSPHORUS LOSSES IN RUNOFF FROM NO-TILL SOYBEANS,
Science and Education Administration, Oxford, MS. Sedimentation Lab.
L. L. McDowell, M. E. Ryan, K. C. McGregor, and J. D. Greer.
Paper No 78-2508, Presented at the 1978 Winter Meeting of the American Society of Agricultural Engineers, December 18-20, 1978, Chicago, Illinois, 8 p. 10 fig, 4 tab, 18 ref. ASAE, St. Joseph, Michigan.

Descriptors: Water pollution control, *Nitrogen, *Phosphorus, *Soil erosion, Runoff, Nutrients, Water quality control, Soybeans, Mississippi, No-till.

No-till soybeans and corn can be grown on highly erodible loessial soils in north Mississippi with reduced soil and plant nutrient losses. Soil loss in 1973 from no-till soybeans, planted directly through previous crop residues, was only 0.4 metric tons per hectare (t/ha) compared with 29 t/ha from conventional till. Total (solution plus sediment) nitrogen (N) and phosphorus (P) losses from no-till soybeans were only 4.7 and 2.8 kg/ha, respectively, compared with 46.4 and 17.6 kg/ha from conventional till. Where applicable, no-till is a best management practice for reducing potential nonpoint pollution by sediments and plant nutrients in surface runoff from agriculture. (Skogerboe-Colorado State)

BOOMS USED FOR OIL SLICK CONTROL,
National Water Research Inst., Burlington (Ontario).
Y. L. Lau, and J. Moir.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 105, No EE2, Proceedings Paper 14530, p 369-382, April 1979. 7 fig, 2 tab, 9 ref, 2 append.

Descriptors: *Oil spills, *Water pollution control, *Laboratory tests, Oil, Oil pollution, Oil wastes, Oil-water interfaces, Currents(Water), Froude number, Hydraulics, Rivers, Harbors, Water pollution, Water quality, Barriers, Oil spill booms, Containment, Oil slicks.

Experiments were conducted to determine the conditions for no contaminant of oil by a boom, the oil-water interfacial friction coefficient, and the maximum angle which a boom can be angled to the flow to deflect an oil slick. The criterion that the densimetric Froude number has to be smaller than about 0.5 for containment was verified. In addition, a new criterion was discovered which specifies a minimum boom draught. The local value of the interfacial friction coefficient was evaluated along the slick, using measured slick profiles, and was found to decrease along the length of a slick. The friction coefficient also increased with increasing oil viscosity. Based on the experimental results, an empirical relationship was derived for the maximum angle at which a barrier could be angled to the flow to completely divert an oil slick. (Sims-ISWS)

ALTERATION OF HYDROGEOLOGIC CONDITIONS DURING MINING OF MINERAL DEPOSITS AND WATER-RESOURCE CONSERVATION MEASURES,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology (USSR).
V. D. Babushkin, N. N. Van'kova, Z. P. Lebedyanskaya, N. V. Sokulina, and I. I. Plotnikov.
Water Resources, Vol. 4, No. 6, p 845-858, November-December 1977. 6 fig, 4 tab, 5 ref. Translated from Vodnye Resursy, No. 6, p 59-76, November-December 1977.

Descriptors: *Mining, *Groundwater, *Pumping, *Water pollution control, Water pollution, Water pollution sources, Mine water, Acid mine water, Recharge, Subsurface waters, Water levels, Chemicals, Water chemistry, Geology, Hydrogeology, Water resources, *USSR.

A generalization of the observations of phenomena occurring in regions of development of mining operations and exploitation of large subsurface-water intakes showed that under these conditions, complex processes occur which have been studied in various degrees. Intense water withdrawal, accompanied by a change in the conditions of recharge and discharge of subsurface waters, often leads to a change in the chemical composition of the waters being withdrawn and to depletion of the subsurface-water supply. In addition, the formation of deep and extensive cones of depression in the system of aquifers causes consolidation of the entire rock stratum and deformation of the ground surface. On the other hand, the discharge of mine waters being pumped out is often linked with pollution of subsurface waters in the region of the deposits and of waters of surface streams. Two ways of protecting water resources in mining regions were proposed. The first is based on developing criteria of the safe exploitation of subsurface-water intakes in regions of water-lowering and drainage systems at mineral deposits without the use of special protective devices. The second method is based on the use of engineering methods of water resources protection (treatment of mine water, use of the waters withdrawn by wellpoints, construction of a watertight curtain around the deposit or its individual zones). METHOD FOR LAKE RESTORATION,
Battelle Memorial Inst., Richland, WA. (Assignee).
G. W. Dawson, and B. W. Mercer.
U.S. Patent No 4,134,831, 7 p, 3 fig, 2 tab, 18 ref; Official Gazette of the United States Patent Office, Vol 978, No 3, p 982, January 16, 1979.

Descriptors: *Patents, *Water pollution treatment, *Water quality control, Water pollution sources, Mine waste, Ion exchange, Binders, Sediments, Mine tailings, Ocean mining, Lake restoration, Magnetic retrieval.

This invention overcomes the difficulties of prior art underwater mining and water body restoration proposals and provides a new and effective method of removing water-soluble substances from the rainwater run-off of mine tailing piles. The process is especially advantageous as compared to prior in situ methods because the invention can be used to remove pollutants from almost any type of aqueous environment and because such pollutants are removed permanently so they cannot possibly be rereleased to the environment at some future time. Magnetically attractable collection units containing an ion exchange or sorbent media with an affinity for a chosen target substance are distributed in the sediments or tailings. After a period of time has passed sufficient for the particles to bind up the target substances, a magnet drawn through the sediments or across the tailings retrieves the units along with the target substance. In many instances the medium can be regenerated and the units subsequently put back into use. The target substance may subsequently be refined for use or, if no commercial value, disposed of in a suitable manner. (Sinha-OEIS)

TROPICAL DISEASE BILHARZIA AND IRRIGATION SYSTEMS IN PUERTO RICO,
Center for Energy and Environment Research, Caparra Heights (Puerto Rico). Div. of Human Ecology.
W. R. Joblin.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol. 104, No. IR3, p 307-322, September 1978. 5 fig, 8 tab, 20 ref.

Descriptors: *Irrigation, *Public health, *Puerto Rico, *Reservoirs, *Schistosomiasis, Hydroelectric power generation, Agricultural engineering, Tropics, Parasitic disease, Drainage, South Coast System, Water supply, Water quality control, Snail control, Projects.

In many tropical countries, the construction of irrigation and hydroelectric systems has caused outbreaks of the parasitic disease, bilharzia, or of schistosomiasis, which is transmitted to man from a fresh-water snail and caused by the parasitic schistosome. The history of irrigation systems in Puerto Rico shows that transmission occurred in the South Coast System soon after it went into operation. The prevalence of infection in children from Guyama, a town in the irrigated zone, was zero and rose to 25% soon after irrigation began. Other irrigation systems constructed later did not have this problem, apparently because they had better drainage systems and did not have the small night-storage ponds that served as snail habitats and transmission sites in the South Coast System. A snail control program was started in this System in 1954 and the prevalence in children dropped to zero by 1966. (Bell-Graf--Cornell)

PLANNING FOR WATER QUALITY: 1776 TO 1976,
Hydrocomp, Inc., Chicago, IL.
D. L. Hey, and W. H. Waggy.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 105, No WR1, p 121-131, March 1979. 35 ref.

Descriptors: *Water pollution control, *Water quality, History, *Sewage disposal, *Sewage treatment, *Public health, Water resources, Planning, Reclamation, Natural resources.

Sewerage works appeared in America in colonial times. Boston had sewers prior to 1700 and cesspools by 1709. These facilities were designed to dispose of waste. The emphasis in national planning was on development. The natural resources were regarded as inexhaustible and the Nation's waterways were simply convenient disposal sites for the wastes generated by development. A major change in thinking about water quality occurred when the link between sewage pollution and fatal epidemics was established late in the 19th century. Regional water quality planning was initiated to protect water supplies and treat drinking water. Public health continued as the dominant theme in water quality planning until the 1960's when broader concerns about environmental quality came to the fore. Water quality planning today is concerned not only with the protection of human health, but also with the preparation and rehabilitation of aquatic ecosystems. (Bell Graf-Cornell)

MUD, BRINE MAY BE CLASSIFIED HAZARDOUS WASTE,
J. P. Pitts.
Drill Bit, Vol. 28, No. 4, p 23-24, April, 1979.

Descriptors: *Groundwater, *Water pollution control, *Regulations, *Drilling fluids, *Hazards, Oil industry, Brines, Mud, Oil wastes, Classification.

Proposed EPA regulations relating to ground water protection could completely shut down oil exploration of the Permian Basin if drilling muds and production brines are classified as hazardous wastes. The proposed regulations would add considerable delay, expense and paper work to drilling operations. An estimated 677,000 jobs will be in jeopardy if these regulations are approved. The oil industry will challenge the proposed regulations on a number of legalities as well as ask specific and definite exemptions of brines and drilling muds from the rules. (Purdin-NWWA)

REPORT OF COMMITTEE ON GROUND WATER SUPPLIES IN NEW ENGLAND.
Journal of the New England Water Works Association, Vol. 95, No. 1, p 36-41, March, 1979. 2 fig.

Descriptors: *Water pollution, *Water wells, *Coliforms, *Gravel packing, Maintenance, Cleaning, Peat, Chlorine, Disinfection, New England.

The scope of the Committee on Ground Water Supplies of the New England Water Works Asso-

ciation includes the following subjects: test well investigations; well construction; pumping tests; operational problems; yields, and water quality problems. A case history of poor well construction which resulted in a contaminated municipal water supply is presented. Coliform bacteria (not fecal) were found in the water soon after a routine maintenance procedure which used surging and plunging. Apparently the surging caused shallow groundwater containing coliform bacteria to flow through a crack in the well seal and down the gravel pack. In order to correct the problem, the source of contamination (a five-foot layer of peat) had to be removed. Chlorine was the injected and after two days the well was pumped to waste. The well was used for six months before it had to be taken out of service due to a recurrence of coliform. Much care and thought must be given to the construction of a gravel packed well before any mechanical or hydraulic methods of cleaning are used. (Purdin-NWWA)

STEADY-STATE DISSOLVED OXYGEN MODEL OF THE WILLAMETTE RIVER, OREGON,
Geological Survey, Portland, OR. Water Resources Div.
S. W. McKenzie, W. G. Hines, D. A. Rickert, and F. A. Rinella.
Available from Branch of Distribution, USGS 1200 S. Eads St. Arlington, VA 22202. Geological Survey Circular 715-J, 1979. 28 p, 15 fig, 5 tab, 16 ref.

Descriptors: *Model studies, *Dissolved oxygen, *Water pollution, *Rivers, *Low flow, Analytical techniques, Evaluation, Biochemical oxygen demand, Water quality control, Nitrification, Oxygen sag, Reaeration, Flow augmentation, Channel morphology, Water temperature, Oregon, *Willamette River, *Steady-state dissolved-oxygen model.

A steady-state dissolved-oxygen model, which is based on synoptic data collected during the summers of 1973 and 1974, has been formulated and tested for the Willamette River, Oregon. The model employs the accounting scheme of C. J. Velz in conjunction with a conceptually simple Lagrangian reference system. The model was calibrated and verified with separate data sets from the synoptic studies. Verification resulted in excellent agreement of model predictions with measured dissolved-oxygen data. Sensitivity analysis was used to examine the relative importance of the individual self-purification processes and model parameters. The verified model provides a planning and management tool for the critical summer low flow, high temperature conditions of the river. (Woodard-USGS)

LAND DISPOSAL OF SEWAGE SLUDGE VOLUME VI (APRIL 1, 1977 - MARCH 31, 1978)
Guelph Univ. (Ontario).
T. E. Bates, A. Haq, J. W. Ketcheson, and Y. K. Soon.
Canada-Ontario Agreement on Great Lakes Water Quality, Training and Technology Transfer Division (Water), Environmental Protection Service, Environment Canada, Ottawa, Canada; Ontario Ministry of the Environment, Pollution Control Branch, Toronto, Ontario, Canada, Research Report No. 90, 1979, 230 p, 143 tab, 1 app. 72-5-17.

Descriptors: *Sewage disposal, *Agricultural watersheds, *Soil contamination, Subsurface waters, Crops, Agricultural runoff, Nutrients, Metals, Precipitation(Atmospheric), Water analysis, Materials, Application methods.

The objective was to determine maximum rates of sewage sludge application which can be used on agricultural soil without contaminating sub-surface water with nitrate nitrogen and surface waters with elements pathogenic to humans and animals, and without reducing the yield or quality of the crops produced. This volume, which covers the period from April 1, 1977 to March 31, 1978, discusses the results from five years of field runoff studies with fall, winter and spring applied fluid sewage sludge on land cropped with grain corn. Nutrients and metals in runoff water were measured. The report also covers the fifth year of field rate and source studies with sludges resultingfrom treatment of sewage with calcium hydroxide, ferric chloride and aluminum sulphate for phosphorus removal. Oneexperiment involved surface sludge applications on a loam soil on which bromegrass was grown, and two experiments involved corn on a loam and a sandy loam. In a greenhouse experiment, six fluid sewage sludges, selected for their high metal content, were applied to a sandy loam soil. In a greenhouse experiment, six fluid sewage sludges, selected for their high metal content, were applied to a sandy loam soil. Eleven crops of ryegrass grown with sludge added before each crop. Half of the treatments received no sludge after the fifth crop. Crop growth and nutrient and metal uptake were studied. (WATDOC)
W79-06849

PHOSPHATE FERTILIZER AND SEWAGE SLUDGE USE ON AGRICULTURAL LAND - THE POTENTIAL FOR CADMIUM UPTAKE BY CROPS,
Department of Fisheries and Environment, Ottawa (Ontario). Wastewater Technology Centre.
M. D. Webber.
Technology Development Report EPS 4-WP-79-2, January 1979, 30 p, 1 fig, 7 tab, 42 ref.

Descriptors: *Phosphates, *Fertilizers, *Sewage sludge, *Land use, *Cadmium, *Heavy metals, Crops, Soil contamination.

Canadian research on cadmium in soils and crops is reviewed and the potential for cadmium uptake by crops grown on soils enriched with phosphate fertilizer and sewage sludge is considered. Evidence indicates that phosphate fertilizer is not a serious hazard to the human food chain, except possibly when cadmium accumulator crops are grown following successive heavy applications of fertilizers with high cadmium concentrations. Sewage sludge use on vegetable crop land appears hazardous because many vegetables accumulate cadmium and would contribute to its excessive buildup in the human body. The Food and Drug Administration calculates that U.S.A. citizens ingest from 70 to 90% of the World Health Organization maximum permissible level of dietary cadmium (70 micro G per person per day), and that any increase should be limited wherever possible. (WATDOC)

LANDFILL CELL DESIGNED FOR HAZARDOUS WASTE DISPOSAL,
Florida State Dept. of Public Works, Jacksonville. Sanitation Div.
A. J. Kinard, and F. P. Tuenge.
Public Works, Vol. 110, No. 5, p 92-94, May, 1979. 1 fig.

Descriptors: *Landfills, *Industrial wastes, *Waste disposal, Hazards, Water pollution control, Regulations, Groundwater, Water table, Dewatering, Bentonite, Leachate, Monitoring, Sampling.

Due to more stringent requirements of newly instituted rules and standards of the Florida Department of Environmental Regulation, the Jacksonville Department of Public Works designed a landfill which could safely handle disposal of special and hazardous wastes. One cell within the landfill was designated for this purpose. Because of a shallow water table, each fill area is dewatered by a system of perimeter ditches which depress the water table at least five feet below the cell floor. Surface runoff is diverted from the cell and directed into the dewatering ditch. Bentonite was used to seal the cell against possible leachate escaping into the groundwater of percolation of ground water into the cell. A 12-inch top coat of earth was applied to provide mechanical protection. When the cell is filled it will be covered with an impermeable barrier of natural clay to minimize infiltration. Monitoring of the area around the landfill was accomplished with six groundwater sampling wells and five surface water sampling points. Samples are analyzed quarterly for pH, iron, conductance, temperature, and COD. Annual tests are made for cadmium, chromium, copper, lead, total coliform, and pesticides. Samples indicate total containment of the leachate within the cell. (Purdin-NWWA)

THE HEALTH EFFECTS OF GROUND WATER RECHARGE: PART II,
National Water Well Association, Worthington, OH.
T. E. Gass.
Water Well Journal, Vol. 33, No. 5, p 38-39, May, 1979.

Descriptors: *Groundwater, *Public health, *Artificial recharge, *Water purification, *Waste water treatment, Sewage treatment, Disinfection, Oxidation lagoons, Biodegradation, Water spreading, Groundwater recharge, Soil disposal fields, Soil physical properties, Absorption, Adsorption, Contact time, Injection wells.

Depending on its quality, method of recharge, and intended reuse, water may undergo primary, secondary, or advanced treatment processes. Primary treatment mechanically removes solids from water. Secondary treatment removes dissolved or colloidal materials using biological systems. Advanced Wastewater Treatment (AWT) extracts heavy metals or toxic substances through physical or chemical means. After AWT, chlorine or ozone disinfection rids water of bacteria and virus still present. Storing effluent in open reservoirs is another way to destroy bacteria and viruses which may remain in treated water. Water spreading, an inexpensive and popular recharge method, uses soil systems to filter out bacteria, virus and other contaminants. Basic criteria used in selecting a recharge site include soil texture, water-transmitting capability, and effects of soil constituents on water. Most biodegradation takes place in the upper 24 to 30 inches of soil. Chemicals are further reduced through absorption by plants in the upper 4 to 5 feet of soil. Chemical adsorption removes pollutants until the soil's total adsorptive capacity is reached. Without adequate contact time for the occurrence of necessary chemical and biological reactions there will be little or no attenuation of pollutants. Contact time is reduced by coarse-textured soil, fractures, and pumping. (See also W79-06895) (Purdin-NWWA)

CONTROLLED DEGRADATION AND/OR PROTECTION ZONES--SENSE,
Environmental Resources Management, Inc., West Chester, PA.
R. A. Landon.
Ground Water, Vol. 17, No. 2, p 159-161, March-April, 1979.

Descriptors: *Controlled degradation zones, *Degradation(Decomposition), *Aquifers, *Waste disposal, Waste assimilation capacity, Water pollution control, Groundwater, Regulation, Land use, Zoning, Attenuation, Leachate, Aquifer characteristics, Water quality, Classification.

Controlled degradation is a sound technical alternative to inflexible water pollution control regulations. Aquifers differ in characteristics and quality and this should be taken into account for more discriminative waste management practices. Numerous studies have shown that leachate can be

afely assimilated into the environment by various orms of attenuation, such as precipitation, adsorp- ion-desorption, and dilution. Permeability, the ontrolling factor in leachate assimilation, should ot be so low as to result in a concentrated buildup f leachate, or so rapid as to result in rapid and xtensive migration of leachates. Waste disposal oning is a concept which uses hydrogeologic fac- ors in designating waste areas in areas of intense and use or waste aquifers in regions where natural r man-made ground water quality is already al- ered. There is a need for waste segregation based n a practical classification scheme. Wastes classi- ied as truly hazardous and toxic should be dis- osed of safely. Land disposal operators must be roperly trained and certified to avoid operational rrors. The attitude of regulatory and legal person- el must become more open and flexible with egard to waste disposal and controlled degrada- ion for select wastes. (Purdin-NWWA)

CONTROLLED DEGRADATION AND/OR PROTECTION ZONES--NONSENSE,
cience and Education Administration, Phoenix, AZ. Water Conservation Lab.
I. Bouwer.
Ground Water, Vol. 17, No. 2, p 162-164, March-April, 1979.

Descriptors: *Controlled degradation zones, *Irrigation effects, *Water reuse, *Waste water disposal, Protection, Groundwater, Aquifers, Water quality, Deep percolation.

Controlled degradation' of ground water is, never- heless, degradation. The following examples pres- nt ground water quality management alternatives o controlled degradation zones. As total dissolved alts and nitrate concentrations in irrigated lands ncreases the quality of ground water deteriorates. his can be reduced by more efficient irrigation ractices. Another potential threat to ground ater quality is land application of waste waters hich is expected to increase dramatically in the ear future. Renovated water may be of much etter quality than the effluent water but is not as ood as the native ground water due to the pres- nce of nitrogen, metals, and trace organics. En- roachment of renovated effluent water upon ative ground water can be controlled by a system f wells or drains or by pretreatment of sewage ffluent before it is applied to land. Where degra- ation of ground water is inevitable the aquifers ould then be used to receive, store, and renovate aste water. Whether an aquifer should be pro- ected or abandoned depends on economic and nvironmental considerations. (Purdin-NWWA)

CONTROLLED DEGRADATION AND/OR PROTECTION ZONES--THE WAY IT LOOKS,
eraghty and Miller, Inc., Port Washington, NY.
. W. Miller.
round Water, Vol. 17, No. 2, p 156-158, March- pril, 1979. 2 ref.

Descriptors: *Controlled degradation zones, Water pollution control, *Aquifers, *Pollution batement, Groundwater, Regulation, Protection, conomic feasibility, Land use, Zoning, Monitor- g, Attenuation, Waste disposal, egradation(Decomposition).

reation of controlled degradation zones requires pplication of special regulatory alternatives to eas where contamination of ground water has ready occurred or is expected to occur. Protec- on zones are areas which have not been adversely ffected by pollution and have strict regulatory ntrols. Controlled degradation and/or protec- on zones are attractive because the technology of round water pollution abatement and containment imperfect and expensive. Controlled degradation quires a large enough buffer zone around the aste disposal site to provide some attentuation of ntaminants, and adequate monitoring to provide rly warning of impending problems. Where the ality of an aquifer has been extensively degrad- , it is rarely technically and economically feasi- ble to rehabilitate it to its natural state. It would be better to condemn wells penetrating the affected aquifer or treat the ground water at the well head. A uniform set of environmental controls cannot be applied as a general solution to all ground water pollution problems. It is too late and too costly to undo many past mistakes. However, with sufficient foresight and creativity, high quality aquifers can be protected with strict land-use controls and advanced engineering design. (Purdin-NWWA)

THE 208 PLANNING APPROACH TO GROUND WATER PROTECTION--WHAT IS WRONG AND WHAT CAN BE DONE ABOUT IT,
K. D. Schmidt.
Ground Water, Vol. 17, No. 2, p 148-153, March-April, 1979. 7 ref.

Descriptors: *Planning, *Water pollution control, *Groundwater, Administrative agencies, Regulation, Hydrogeology, Professional personnel, Education, Training.

Deficiencies in the 208 planning approach and possible remedies are discussed. These deficiencies include: overemphasis on protection of surface water quality at the expense of ground water quality; failure to recognize problems indigenous to arid lands; ambiguous definitions of 'point and non-point sources' of ground water pollution; inadequate specifications for the type and degree of waste treatment; a serious lack of qualified ground water geologists and hydrologists in regulatory and planning agencies; too much attention on formulating control measures and not enough on problem definition, monitoring, and data collection; lack of training in ground water quality for those ground water professionals involved in 208 programs. Solutions to these problems include placement of more ground water professionals in local, State and Federal regulatory agencies. Provisions are needed in the 208 approach to insure that ground water professionals are involved. The public should be educated on a long-term basis about ground water and pollution. Academic training in ground water needs to be expanded and ground water quality elevated to the same level as ground water quantity. Finally, registration or certification in the field of ground water hydrology is urgently needed. (Purdin-NWWA)

THE 208 PLANNING APPROACH TO GROUND WATER PROTECTION - A FOOT IN THE DOOR,
Illinois Environmental Protection Agency, Springfield.
D. Wallace.
Ground Water, Vol. 17, No. 2, p 142-147, March-April, 1979.

Descriptors: *Planning, *Protection, *Groundwater, *Water management(Applied), Water pollution control, State government.

As pollutants accumulate on land, the potential for ground water pollution increases, and ground water management planning becomes more significant. The 208 programs may provide the states with the means to involve the public in planning and determining practical solutions to ground water pollution problems. Needs and obstacles in establishing a 208 program for groundwater planning in Illinois are discussed. The present approach of remedial action for major cases of pollution provides a reasonable degree of protection in terms of control, but there is not a high degree of planning for the management of future ground water quality and quantity in Illinois. The 208 approach addresses three new requirements for plans prepared with Federal funding: (1) plans must have continual public involvement, (2) alternatives must include the definition of mechanisms for implementation, and (3) plans must be updated annually to reflect the results of each year's progress. Planning programs under 208 are usually regional in scope rather than site-specific. The preparation of a '5-Year Strategy' for each State under the Water Quality Management Planning programs, public involvement, and the USEPA's new emphasis on aquifer protection as a priority issue will provide the mechanism for funding ground water planning under 208 programs. (Purdin-NWWA)

THE 208 PLANNING APPROACH TO GROUND-WATER PROTECTION - A PROGRAM OVERVIEW,
Environmental Protection Agency, Washington, DC. Water Planning Div.
M. Hurd.
Ground Water, Vol. 17, No. 2, p 136-140, March-April, 1979.

Descriptors: *Water pollution control, *Water law, *Administrative agencies, Groundwater, Planning, Regulation, Governments, Programs, Water management(Applied).

Section 208 of the Clean Water Act will integrate economic, fiscal, social, and political factors affecting water pollution control into State and areawide plans and provide state and local governments with means to develop and enforce point, non-point, and ground water pollution control. 208 agencies will educate local elected officials, operating agency personnel, and the general public concerning local and regional problems and solutions. Eventually, they will play a role in the sole source aquifer designation and management process, and the siting and regulation of pits, ponds, lagoons, sanitary landfills and waste treatment facilities. Examples of successful 208 planning agencies are: Nassau-Suffolk Regional Planning Board (NY); Old Colony Planning Council (MA); and Ventura County Regional Sanitation District (CA). These agencies have used funds to identify problems such as salt-water intrusion and contamination from storm runoff. Through ground water studies, each assessed the extent of the problems and used their analysis to produce protection and control recommendations. Integration of 208 with other Clean Water Act programs as well as with programs established under the Safe Drinking Water Act and the Resource Conservation and Recovery Act are now being explored as a means of increasing water quality management efficiency and capability. ELECTRO-OSMOSIS IN GROUND WATER POLLUTION CONTROL,
California Univ., Santa Barbara. Dept. of Mechanical and Environmental Engineering.
J. C. Bruch, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 377, Price codes: A00 in paper copy, A01 in microfiche. Technical Completion Report, September, 1976. 80 p, 11 fig, 64 ref.

Descriptors: *Electro-osmosis, *Water quality control, *Groundwater movement, Finite element analysis, Aquifers, Confined water, Upconing, Seepage, Dispersion, Flow control.

A numerical model is presented to evaluate the feasibility of using electro-osmosis as a tool in ground water pollution control in aquifers of low permeability. The finite element method is applied to three types of ground water flow problems: movement of ground water in a confined aquifer; prevention of upconing during pumping; and movement of pollutants in a two-dimensional steady seepage flowfield which may have any arbitrary shape. No electro-osmosis was included in the seepage flowfield so that the seepage and dispersion could be treated as uncoupled. The electro-osmosis effect was shown to change the flowfield pattern in a confined aquifer and consequently, the movement of a pollutant in such a flowfield. The electrokinetic phenomenon also reduced the effects of water coning while pumping gas from a gas-water reservoir. (Purdin-NWWA)

DEVELOPMENT OF A MODIFIED TRACER TECHNIQUE FOR MEASURING THE STREAM REAERATION RATE,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
J. M. Kwasnik, and T. S. Feng.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 317, Price codes: A05 in paper copy, A01 in microfiche. University of Massachusetts Water Resources Research Center Publication No. 102, 1979. 68 p, 16 fig, 6 tab, 35 ref, 2 append. OWRT-A-088-MASS (1), 14-34-0001-8023.

Descriptors: *Reaeration, Rhodamine, *Tracers, *Analytical Technique, Biochemical Oxygen Demand, Chemical Oxygen Demand, Critical Flow, Dissolved Oxygen, Gas Chromotography Fluorescence, Fluorescent Dye, Ethylene.

The stream reaeration rate, K2, is a key factor in the calculation of allowable waste levels from point sources of pollution. Past attempts to produce a reliable, accurate and easy to apply method for its measurement have produced a variety of empirical equations that fail to work on river reaches significantly different from those for which the equations were developed. The modified tracer technique of K2 measurement, originally developed by Rathbun, was investigated. The technique uses a hydrocarbon tracer, ethylene, and a conservative tracer, Rhodamine-WT dye. Laboratory experiments determined the parameters essential to the successful field use of the technique. Initial field testing was begun in June, 1977 on a channelized section of the Mill River in Northampton, Mass. Two runs were conducted to verify the reproducibility and precision of the technique. Additional tests were run on the North River in Colrain, Massachusetts. The results of the field testing indicate that the modified tracer technique is a precise and accurate means of directly measuring the reaeration rate, K2. From results of preliminary laboratory experiments, it is recommended that additional laboratory testing be undertaken in regard to pollutional effects. (Godfrey-Mass)

STOCHASTIC ANALYSIS FOR WATER QUALITY,
Utah Water Research Lab., Logan.
F. Malone, S. Bowles, J. Grenney, and P. Windham.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-295 392, Price codes: A06 in paper copy, A01 in microfiche. Publication UWRL/Q-79/01, March 1979. 75 p, 10 fig, 14 tab, 2 append. OWRT A-039-UTAH (2), 14-34-0001-8047.

Descriptors: *Stochastic processes, *Linear programming, Water quality, Monte Carlo method, Phosphorus loading, Colorado River, Lake Washington.

This report demonstrates the feasibility of applying stochastic techniques to linear water quality models. The Monte Carlo, First Order, and Generation of Moment Equation techniques are applied to a long term phosphorus model of Lake Washington. The effect of uncertainty of the phosphorus loading term on simulated phosphorus levels is analyzed. All three stochastic techniques produced the same results. The simulated concentrations of phosphorus in the water column are very responsive to uncertainty in annual phosphorus loading, the sediment concentration relatively insensitive. The Monte Carlo technique requires the most computation time of the three stochastic techniques applied. The First Order and Generation of Moment Equation techniques are precise and efficient methods of stochastic analysis. In this application they required less than one thousandth the computation time of the Monte Carlo technique. The Generation of Moment Equations technique is also applied to a steady state salinity model of the Colorado River system. Two sources of uncertainty are considered: (1) the estimation of 'steady state' values of salinity loading from a limited historic data base and (2) the estimation of salinity loading from irrigated land by a semi-empirical approach. Six stochastic simulations of the Colorado River system are presented. Coefficients of variations of simulated salinities at Imperial Dam vary from 5.7 to 10.3 percent. The major source of uncertainty in all simulations is the estimation of the steady state salinity loading with the agricultural loading term becoming important in some simulated management alternatives.

MULTIPLE WATER SUPPLY APPROACH FOR URBAN WATER MANAGEMENT,
Weston Environmental Consultants-Designers, West Chester, PA.
A. K. Deb.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 768, Price codes: A07 in paper copy, A01 in microfiche. Prepared for National Science Foundation, Washington, D.C., Applied Science and Research Applications (ASRA), March 20, 1978. 118 p, 28 fig, 22 tab, 61 ref. ENV7618499.

Descriptors: *Water quality, *Water supply, *Water quality planning, *Water supply development, *Water demand, *Water management(Applied), *Models, Waste water, Drinking water, Water treatment, Water quality control, Recycling, Water distribution(Applied), Nonpotable water, Potable water.

The report describes a systems model developed to help planners and engineers to decide whether the multiple supply approach to urban water management is beneficial in long-term planning of water resources. Three grades of water were considered in developing the model: potable (from protected or unprotected sources, treated to highest quality for ingestion); subpotable (of questionable quality in terms of chemicals, but bacteriologically safe); and nonpotable (reuse of wastewater effluent for industrial, agricultural, and urban irrigation uses). Assuming that a municipal system should not employ recycled water for potable uses, separate, dual or multiple supply systems would have to be set up to provide recycled water for subpotable and nonpotable uses. Collection and analysis of water demand data included a detailed survey of water utilities serving populations of 20,000, 100,000 and 500,000 from all parts of the country. Urban water demand categories used were residential (interior and exterior), commercial, industrial, public, and unaccounted for uses. Water quality and treatment requirements for dual or multiple water supply systems, and sources of supply, are presented. The quality of potable water is regulated by the Safe Drinking Water Act of 1974 (P.L. 93-523). Cost functions of 36 unit processes were developed and incorporated into the model. The model was applied to several hypothetical single, dual and multiple water supply systems to illustrate its applicability. The model is very flexible and can handle a conventional system, a dual or multiple system including reuse, or a regional system with up to 10 cities. (Arnold-NC)

MARINE ECOSYSTEM MODELLING IN THE MEDITERRANEAN.
Nature and Resources, Vol 13, No 4, p 7-16, October-December, 1977.

Descriptors: *Ecosystems, *Ecology, *Mathematical models, *Marine biology, *Southern Levantine Coastal Model, *Mediterranean, Ecological distribution, Food chains, Marine microorganism's nutrients, Mathematics, Computer programming data collection, Chemical reactions, Models, Sensitivity analysis simulation.

This paper models ecological relationships and changes in the Mediterranean area. The major events causing ecological changes in the area were the opening of the Suez Canal, the construction of the Aswan High Dam, dumping of urban wastes, overfishing, and spillage of oil from tankers. The purpose of modelling is to represent nature in some abstract language as accurately and manageably as possible. This paper offers a tentative classification of appropriate models for the Mediterranean: (1) large-scale ecosystem models dealing with general relationships in the Mediterranean; (2) meso-scale and small-scale ecosystem models dealing with semi-enclosed bays and smaller marine systems; (3) process or linked-process models to describe processes such as eutrophication or toxicity; and (4) pathway models to deal with the transfer of selected metals and hydrocarbon concentrations within the main components of Mediterranean ecosystems. The principles and procedures of ecosystem modelling are outlined and the steps involved in the process are discussed. These consist of: ecosystem conceptualization; ecosystem mathematization; ecosystem calibration; ecosystem simulation; and ecosystem analysis. The Southern Levantine Coastal Model is described as an example of an ecosystem model with figures showing a generalized coastal system of the Southeastern Mediterranean. Finally data requirements for ecosystem modelling and the need for extensive research in the biological sciences to allow the modelling of problems vital to public concern are discussed. (Coan-NC)

REGIONAL SEWERAGE PLANNING BY MIXED INTEGER PROGRAMMING,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
D. T. Lauria.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 066, Price codes: A04 in paper copy, A01 in microfiche. Sponsored by Applied Science and Research Applications, National Science Foundation, Washington, D.C., Report No. NSF-RA-E-75-203, 1975. 52 p, 6 fig, 7 tab, 3 append. GI37475.

Descriptors: *Regional planning, *Wastewater treatment, *Sewerage, *Upper Neshaminy Creek Basin(PA), *Computer models, Sewage treatment, Pumping plants, Interceptor sewers, Linear programming, Mathematics, Data processing, Cost functions, Force mains, Gravity sewers, Mixed integer programming, Computer programs.

This report presents a mixed integer programming (MIP) model for determining the location, timing, and scale of regional wastewater treatment plants, sewers, and pumping stations. There are certain economies of scale in regional wastewater treatment plants, but the problem of planning these facilities is complicated because of the large number of alternatives involved. A model was sought which would address questions of where, when, and to what scale to build regional plants, gravity sewers, pumping stations, and force mains. The model takes account of existing wastewater facilities and includes operating as well as construction costs. Concave cost equations are approximated by fixed charge functions. The solution strategy for solving the model was developed within the context of branching and bounding techniques. The strategy in this study pursued a variety of methods including disaggregation, upper bounding, priority ordering, and time staging. The model was applied to the Upper Neshaminy Creek Basin, PA, which includes 18 plant sites and 19 sewers. Pertinent data on wastewater inputs at the various nodes are presented. Solution of 9 problems is presented with between 20 and 200 integer variables, 40 to 250 continuous variables, and 60 to 450 constraints. (Coan-NC)

ty landscapes were delineated in Tippecanoe unty, Indiana on the basis of geomorphic and tural criteria. Measurable physical, biologic and tural parameters which enhance or detract from dscape aesthetics were identified, described, and anged in matrix format. Aerial photographs, ographic maps, land use maps, drainage maps d field observations were used to categorize the nic factors in each landscape. Factor analyses of matrices were employed to identify landscapes h unique scenic attributes. Scenic indices then re developed for the purpose of hierarchially king the scenic qualities of the various land- pes. Nine landscapes of unusual aesthetic value re identified in Tippecanoe County. Five of se are stream valleys whose scenic pleasantness primarily attributable to the natural topographic ersity deriving from erosional processes and the valence of indigenous floral and faunal commu- es. The other four scenic landscapes are upland, erfluvial areas that owe their aesthetic appeal to uite of depositional glacial features and patterns agricultural land use. The major streams and es of Tippecanoe County were evaluated quali- vely and quantitatively in terms of scenic and reational usefulness, and recommendations for ir future use were proposed.

INTEGRATED WATER MANAGEMENT WITH REUSE: A PROGRAMMING APPROACH,
Arizona Univ., Tucson.
D. E. Pingry, and T. L. Shaftel.
Water Resources Research, Vol. 15, No. 1, p 8-14, February 1979. 7 fig, 3 tab, 4 equ, 13 ref.

Descriptors: *Water reuse, *Water delivery, *Economic efficiency, *Nonlinear programming, *Cost minimization, *Water quality, *Flow requirements, Water management(Applied), Equations, Design, Decision making, Optimization, Recycling, Mathematical models, Rivers, Systems analysis, Constraints, Treatment facilities, Transshipment formulation, Economies of scale.

Large quantities of high quality water may no longer be available at low cost in a growing number of regions; this has spurred interest in water reuse and recycling in the derivation of economically feasible water delivery systems increases the complexity of this optimal design problem. Presented herein is a nonlinear programming model which accounts for both flow requirements and water quality, the model containing two different constraint sets. The first set--flow constraints--can be reformulated as a transshipment form of the transportation problem where sources act as supply points (production plants) and disposal areas are demand points (markets). The objective function is to minimize total cost while meeting environmental and legal restrictions. The total cost of delivery and disposal is the sum of the piping cost, the treatment costs, the source costs and the disposal costs. Because of the model's transshipment formulation, the solution technique seems to be effective in aiding the design decisions. (Bell-Cornell)

TWO CENTURIES OF WATER PLANNING METHODOLOGY,
R. K. Linsley.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 105, No. WR1, p 39-45, March 1979. 13 ref.

Descriptors: *Water resources development, *Water plans, *Planning, *Social impact, *History, *Economic analysis, Water quality, Hydrology, Systems engineering, Environmental impact statement, Projects, Methodology.

The history of water resource planning since 1776 is reviewed with special reference to economic, social, environmental, and hydrologic methodology and applications of systems analysis. The ability of the individual planner stands out as the key factor in successful planning during the period up to about 1920. The chief of the planning team is in a similar position today. Methodology has clearly advanced during the two centuries since 1776 and is now clearly capable of providing an effective base for decision making when all aspects are properly integrated. WATER RESOURCES SYSTEMS PLANNING IN U.S.A.: 1776-1976,
Washington Univ., Seattle.
S. J. Burges.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 105, No WR1, p 91-111, March 1979. 54 ref.

Descriptors: *Water resources, *Water plans, *Systems analysis, *Multiple-purpose projects, *History, *Systems management, Irrigation, Flood control, Water supply, Planning, Federal government, Colorado River, Canals, Waterbourne transportation, Western U.S., Agriculture.

Some historical aspects of water resources development and use covering the nation's first 200 years were examined to determine at what points in history the systems method of analysis was used in water resources planning. The systems method was found to apply to cases where clear single objectives directed planning. In situations where the systems view was not taken, less than satisfactory systems resulted. Examples considered include: canals and waterborne transportation, water supply to New York City, the Miami Conservancy District, TVA, and Irrigated Agriculture. The systems approach was followed both in the Miami Conservancy District and TVA within the limits of the analysis techniques available. Areas of potential application of systems analysis tools and techniques in the near-term future (urban water resources management, operation of multipurpose facilities, and water resource allocation) are examined to illustrate the need for the use of systems analysis tools for handling complex constrained systems. WATER RESOURCES PLANNING AND PUBLIC HEALTH: 1776-1976,
Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
L. B. Dworsky, and B. B. Berger.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 105, No WR1, p 133-149, March 1979. 33 ref.

Descriptors: *Urbanization, *Water pollution control, *Water resources, *History, *Water plans, *Potable water, Water management(Applied), Water utilization, Urban development, Environmental engineering, United States, Public health.

Planning for water use and management extends from the earliest cultures of agriculture and water navigation to twentieth century energy development. Within this historical framework, the nature of the relationship of water resources and public health provides an important mirror to the character of human civilization over time. In overview terms, this paper describes man's concern for the water environment from historical and scientific perspectives. Early institutions to manage the public health aspects of water resources, the impact of sanitary engineering on urbanization, and the rise of modern environmental engineering in relation to controlling water pollution are considered. Examined is a number of specific elements illustrating the substantial impact that public health interests have had on water resources planning in the United States. Beyond usual drinking water supply and pollution control matters, the paper touches on public safety, insect-borne disease control, institutional change, and issues associated with broad-based multipurpose water resource development planning. WESTERN ECONOMIC DEVELOPMENT AND WATER PLANNING: BUREAU OF RECLAMATION,
Utah State Univ., Logan.
J. E. Keith, K. Wilde, J. C. Andersen, and A. LeBaron.
Journal of the Water Resources Planning and Man-

agement Division, Proceedings of the American Society of Civil Engineers, Vol 105, No WR1, p 161-170, March 1979. 11 ref.

Descriptors: *Water resources development, *Water rights, *Water shortage, *Water allocation(Policy), *History, *Economic development, *Bureau of Reclamation, Municipal water, Recreation, Water plans, Agricultural watersheds.

Reviewed are the early and recent history of the relations between water planning and economic development in the West and Bureau of Reclamation activities. The objectives of Bureau development projects have shifted from the agrarian egalitarian goals of the past to provision of municipal and industrial water and power and recreation and other benefits as the relative benefits to agriculture have declined. The economic efficiency requirements, the environmental movement, and the concommittent comprehensive planning requirements imposed on Federal projects have resulted in the challenge to development which the Bureau currently faces. Bureau supporters come primarily from states that wish to confirm water rights and receive agricultural subsidies in the form of cheap water. The development of vast energy resources and population growth may, however, provide new bases for a resurgence of the engineering solutions of the Bureau to water scarcity and allocation problems in the West. Descriptors: *Water resources, *Planning, *Future planning(Projected), *Systems analysis, *Computer models, Estimating, Forecasting, Decision making, Methodology, Assessment, Water supply, Water quality, Water pollution sources, Data collections, Social aspects, Environmental effects, Economic impact, Resource allocation, Waste treatment, Runoff, Community development, Washington(D.C.).

A study conducted by the Metropolitan Washington Council of Governments resulted in a Framework Resources Planning Model which is a comprehensive analytical tool to be used in areawide water resources management planning. The linked major physical simulation components test alternative future community development patterns by small area, estimate water demands by usage categories, calculate sewage flows based on waters demands and add infiltration/inflow, simulate storm water runoff, test application of alternative waste treatment management systems, and simulate the quality response of the region's major water body. Methodologies for assessing the fiscal, social, and environmental impacts of alternatives are included in the Model's impact assessment portion. The Framework Model, currently used in planning programs, was tested for the Washington Metropolitan region by identifying the cost-effectiveness of six alternative areawide resources management strategies. REGULATORY WATER QUALITY MONITORING: A SYSTEMS PERSPECTIVE,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
R. C. Ward.
Water Resources Bulletin, Vol. 15, No. 2, p 369-380, April 1979. 2 fig, 23 ref.

Descriptors: *Water quality, *Monitoring, *Data, Regulation, Legal aspects, Systems analysis.

Regulatory water quality monitoring has evolved to the point where it is a rather complex system encompassing many monitoring purposes and involving many monitoring activities. Lack of a system's perspective of regulatory monitoring hinders the development of effective and efficient monitoring programs to support water quality management. In this paper, the regulatory water quality monitoring system is examined in a total systems context. The purposes of regulatory monitoring are reviewed and categorized according to their legal evolution. The activities of regulatory monitoring are categorized and organized into a system which follows the flow of information through the monitoring program. The monitoring purposes and activities are combined to form a monitoring system matrix--a framework within which the total regulatory water quality monitoring system is defined. The matrix, by defining the regulatory monitoring system and clarifying many interactions within the system, provides a basis upon which a more thorough approach to managing, evaluating, and eventually optimizing regulatory monitoring can be developed. TWO-STEP ALGORITHM FOR DESIGN-STAGE LONG-TERM CONTROL OF A MULTI-PURPOSE RESERVOIR,
Institut za Vodoprivredu Jaroslav Cerni, Belgrade (Yugoslavia).
S. Simonovic.
Advances in Water Resources, Vol. 2, No. 1, p 47-49, March 1979. 3 fig, 6 ref.

Descriptors: *Multiple-purpose reservoirs, *Long-term planning, *Algorithms, *Stochastic processes, Design, Probability, Computer programs, Optimization, Linear programming, Chance-constrained programming, Equations, Control, Mathematical models, Systems analysis, Iterative convolution, Random variable.

The algorithm presented herein was developed for solving the problem of long-term control or planning for the functioning of a multi-purpose reservoir pool. It is a stochastic problem, involving random parameters in equations by which the control is defined. The complexity of the problem is imposed by the two-step algorithm for solving the long-term optimal control: (1) explication of all chance constraints on the state and control coordinates is being done at the first step; (2) the choice of optimum control is being done in the second step. The method of iterative convolution has been chosen for the first, and the method of linear programming for the second step. (Bell Graf-Cornell)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-292 303, Price code: A08 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 78-90, September 1978. 146 p, 14 fig, 7 tab, 9 ref.

Descriptors: *Urban runoff, *Storm runoff, *Computer models, *Rainfall-runoff relationships, Storm drains, Drainage systems, Channel flow, Flow characteristics, Land use, Soil moisture, Urbanization, Simulation analysis, Analytical techniques, Surface waters, Hydrographs.

A computer program of a watershed model for routing urban flood discharges through a branched system of pipes or natural channels using rainfall as input has been developed and documented. The model combines soil-moisture-accounting and rainfall-excess components developed by Dawdy and others (1972) with the kinematic-wave routing method presented by Leclerc and Schaake (1973). WATER RESOURCES PLANNING USING COMPUTER GRAPHICS,
Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
P. N. French, L. E. Johnson, D. P. Loucks, and D. P. Greenberg.
Preprint 3342, American Society of Civil Engineers (ASCE) Convention and Exposition, Chicago, Ill., October 16-20, 1978. 21 p, 29 fig, 4 ref. OWRT C-7183(6226)(3). 1434-0001-6226.

Descriptors: *Water resources, *Planning, *Computer graphics, *Analytical techniques, River systems, Water quality, Flood control, Regression analysis, Water supply, Linear programming, Simulation analysis, Reservoirs, Multiobjective analysis, Data input, Prediction, Systems analysis.

Presented are computer-aided design methods for water resources planning using interactive computer graphics routines. Four specific types of problems are illustrated: water quality prediction, using simulation and linear programming; flood management, using simulation; reservoir simulation; and multiobjective reservoir-water supply planning which utilizes linear programming. In all cases, tablet digitizing routines have been used for the input of spatial and other data, and vector display methods used for the graphical output. Visual feedback is provided at all stages of the procedures. The interactive computer graphics methods provide many advantages, including convenience, flexibility, the reduction of input errors, and improved communication and response. (Bell-Graf--Cornell)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 308, Price codes: A11 in paper copy, A01 in microfiche. Massachusetts Agricultural Experiment Station Research Bulletin Number 653 September 1978. 229 p, 69 fig, 128 tab, 374 ref, 6 append. OWRT-B-029-MASS(5), 14-31-0001-3897.

Descriptors: Bibliographies, *Land use, *Planning, Assessments, *Landscaping, Urbanization.

A three phase landscape planning framework model is developed, including procedures for landscape assessment, plan formulation, and plan evaluation. Assessment procedures identify, locate, estimate quantity and quality, valuate, and map environmental opportunities and constraints. Plan formulation procedures incorporate information from assessment phase into generation of alternative land use scenarios, which meet specified objective scenarios on landscape values, ecological values, and public service resources. Plan formulation and evaluation procedures are interactively accessed from a remote CRT terminal. Application of planning model to 3 Massachusetts communities showed that one future growth scenario, amounting to a 170 percent increase in urbanized area, could occur with no significant loss or impairment

assessed values. Other growth scenarios inurred significant loss or impairment to assessed alues in excess of 600 million dollars. (Godfrey-lass)

he objective of process control is to obtain the aximum cost benefits from a computer based ntrol system. However, during project develop-ent, many things can go wrong, and software sts may drastically increase the total system cost. is therefore important that water system opera-rs, managers, and engineers know how to select e appropriate hardware and software for a com-ter-based system. To decide finally whether or t a particular system should be placed under mputerized control, the capabilities of the com-ter must be evaluated. Presented is a checklist scribing the specific attributes of a real-time ocess control computer system. (Bell Graf-Corll)

uring the past decade, the systems approach to orage reservoir problems has been heralded as mething of a jump from the stone age of mass-rve analysis into the modern era of science. In ality, however, no such jump ever occurred; ere were a number of small ones but, contrary to e common belief, many of them were confined to e staircase of mass-curve analysis and not all of em were in the upward direction. This paper tempts to put the mass-curve technique into oper perspective by clearing out some undesira-e semantic underbrush accumulated over the past cades and by showing an intrinsic identity of me mass-curve and systems-analytic formula-ons. It demonstrates that, for the important spe-al case of convex loss functions, both the dynam- and the linear programming formulations of timum reservoir operation policies as developed er the past decade still have a long way to go to atch a 55-year old mass-curve technique in terms exactness and accuracy, as well as computational efficiency. Finally, it shows that the mass-curve technique provides insights into the problems of storage reservoir operation which are entirely out of reach of the systems-analytic methods and can significantly enhance the art of reservoir design and operation. WATER QUALITY IN RIVER SYSTEMS: MONTE-CARLO ANALYSIS,
Australian National Univ., Canberra. Centre for Resource and Environmental Studies.
P. Whitehead, and P. Young.
Water Resources Research, Vol. 15, No. 2, p 451-459, April 1979. 9 fig, 2 tab, 25 ref.

Descriptors: *Water quality, *River systems, *Monte Carlo method, *Simulation analysis, *Mathematical models, *Stochastic processes, *Bedford Ouse River(England), *Probability, Forecasting, Downstream, Standards, Effluents, Upstream, Environmental impact, Assessment, Equations, Biochemical oxygen demand, Dissolved oxygen, Aquatic environment, Planning, Statistical methods, Systems analysis, Uncertainty, Sensitivity analysis, Multireach flow, Influents.

Water quality models are described for a 55-km stretch of the Bedford Ouse River in central eastern England. The dynamic models relate time-varying upstream influents to downstream water quality and are stochastic to account for the uncertainty in the system. A stochastic simulation provides forecasts of water quality at a downstream abstraction point in terms of probability distributions, and these are compared with water quality standards, also defined in probabilistic terms. Effluent from the new city of Milton Keynes enters the river at an upstream point, and the impact of the effluent on the aquatic environment is assessed with the sensitivity of the water quality model to parametric uncertainty. OPTIMIZATION OF SALINITY CONTROL IN GRAND VALLEY,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
W. R. Walker, G. V. Skogerboe, and R. G. Evans.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol. 105, No. IR1, p 15-28, March 1979. 8 fig, 2 tab, 23 ref.

Descriptors: *Desalination, *Salinity control, *Grand Valley(Col), *Simulation analysis, *Cost-effectiveness, *Optimization, Irrigation efficiency, *Canal linings, Automation, Seepage, Return flow, Drainage, Cost minimization, Structural alternatives, Mathematical models, Systems analysis.

A mathematical simulation of the cost-effectiveness relationship for various agricultural and desalination structural alternatives for reducing salt pickup by irrigation return flows was developed and applied in the Grand Valley of western Colorado. Cost-effectiveness functions developed from the model were then optimized using a least-cost criterion to determine the most cost-effective strategies for salinity control in the valley. The analysis indicates that lining small conveyance channels to reduce seepage and increase the efficiency of the existing furrow irrigation systems should be given the highest priority. Canal lining and desalination of return flows are costly alternatives, but they are feasible when the level of salinity control requires nearly total alleviation of the problem. Some structural alternatives such as field and interceptor drainage exhibited more than an order of magnitude higher costs and should not be considered. (Bell Graf-Cornell)

REGIONAL DEVELOPMENT PLAN EVALUATION: THE USE OF INPUT-OUTPUT ANALYSIS,
Economics, Statistics, and Cooperatives Service, Washington, DC.
R. McKusick, N. Bills, R. Clark, C. Jones, and R. Niehaus.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 951, Price codes: A07 in paper copy, A01 in microfiche. Agriculture Handbook No. 530, May 1978. 132 p, 32 tab, 60 ref, 3 append.

Descriptors: *Regional development, *Planning, *Water resources development, *Comprehensive planning, *Input-output analysis, Land resources, Estimated costs, Income analysis, Employment, Economic impact.

The uses and limitations of input-output (I-O) analysis are examined in the plan evaluation process for water and related land resources by the Federal government. Supply and demand relationships of an economy are depicted by an I-O model which also estimates the indirect economic changes which would occur if such a plan were implemented. The appropriate use of I-O models was studied in U.S. Department of Agriculture (USDA) planning efforts; applied examples are presented of I-O multipliers and models which are consistant with the Water Resources Council's 'Principles for Planning Water and Land Resources' and 'Standards for Planning Water and Land Resources'. Economic information needs associated with regional development as were determined and quantitative methods used to develop this information were assessed before I-O multipliers, models and their application were studied. The application correct procedures for using regional I-O techniques is demonstrated in the estimation of secondary market impacts of plans. Evaluating the feasibility of resource plans for a regional economy as opposed to project justification is emphasized. Although this study is specifically oriented to USDA economists formulating and evaluating plans under various USDA resource programs, it is of potential use for regional planning by Federal, State and local planners. PALMETTO BEND DAM AND RESERVOIR: NEED FOR IMPROVED ANALYSIS OF ALTERNATIVES AND COST DATA.
Comptroller General of the United States, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-275 328, Price codes: A06 in paper copy, A01 in paper copy. December, 1977. 28 p, 4 append.

Descriptors: *Water resources development, *Water supply, *Water demand, *Palmetto Bend Dam(TX), Water storage, Water requirements, Storage capacity, Inflation, Water costs, Cost trends, Recreation, Reservoirs.

The Palmetto Bend Dam and Reservoir Project, in Jackson County, TX, is designed to provide municipal and industrial water, fish and wildlife benefits, and recreational opportunities. The Bureau of Reclamation is responsible for its construction. This study reviews the cost and schedule experience of the project, the potential use of the project, and the selection process which chose this particular project instead of other alternatives. Since authorization in 1968 the project's estimated cost has more than doubled and additional cost growth is anticipated. The scheduled completion date has been delayed until September 1979, over 2 years from the original estimate. Tables and graphs pres-

ent the cost growth by project feature, and an analysis of the reasons for cost growth; an analysis of the Bureau's reasons for cost increases is also presented. The Bureau said inflation accounted for 90% of the cost increase; GAO's analysis indicated inflation accounted for only 60% of the increase. The study determines that two events which justified the project originally have changed. First, the original population projection which was to increase because of urban expansion has been overly optimistic. Second, industrial expansion may be slowed by the water's high price and cost of the distribution system. Several problems with the Bureau's implementation of federal policies and standards for water and water-related land development projects are presented. (Coan-NC)

IRRIGATION DATA BASE FOR ARIZONA,
Sandia Labs., Albuquerque, NM.
I. J. Hall, and S. Vandevender.
Available from the National Technical Information Service, Springfield, VA 22161 as SAND-77-0968, Price codes: A02 in paper copy, A01 in microfiche. Report No SAND 77-0968, January 1978. 25 p. AT(29-1)-789.

Descriptors: *Irrigation, *Arizona, *Irrigation programs, *Basic data collections, *Solar radiation, Energy, Agriculture, Hydrologic data, Irrigation practices, Irrigation systems, Surface irrigation, Wells, Groundwater, Crops, Evaluation, Pumps.

Data describing irrigated agriculture in Arizona were compiled to provide information to determine regions where solar irrigation is most applicable. Arizona was selected for this preliminary data compilation and analysis, because it is the site of the 150 KWe solar irrigation experiment. Tabulated information on the crops grown, the irrigation wells, and irrigation pumps is provided for the following counties in which irrigated agriculture is significant: Cochise, Graham, Maricopa, Pima, Pinal, and Yuma. FACTORS AFFECTING WATERWAY INVESTMENT DECISIONS,
G. J. Kelnhofer, Jr.
Water Resources Bulletin, Vol. 14, No. 6, p 1423-1428, December 1978. 12 ref.

Descriptors: *Investment, *Decision making, *Inland waterways, *Navigation, *Effects, Evaluation, Water resources, Costs.

There are many factors, other than economic efficiency, which must be considered in judging the merits of proposed investments in the inland navigation system. No satisfactory formula exists for deciding the net worth of public investments in water resources projects. Such a measure would not be accepted because these investments can serve conflicting goals. Political rather than technical, judgments are required to resolve these goal conflicts. WATER PLANNING--OVERVIEW,
E. W. Weber.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 105, No. WR1, p 3-7, March 1979.

Descriptors: *Planning, *Water resources, *Cost-benefit analysis, *Legislation, *Water plans, Navigation, Environment, Flood control, Irrigation, Pollution.

The significance of the progression of institutional and procedural techniques in water planning during the past 200 years lies primarily in recognizing that water planning is not merely planning for use of a resource; it is, in effect, planning how to use water wisely to meet the basic needs of people in light of their probable preferences for use of air, water, land, and the environment in general. The lessons learned show the interdependence of water and other resources, the several professional skills needed on planning teams, and the need for displaying alternatives of choice that have the greatest flexibility and probability of satisfying people's needs in the face of continuing change. (Bell Graf-Cornell)

WATER RESOURCES PLANNING--ITS RECENT EVOLUTION,
Clark Univ., Worcester, MA. Dept. of Environmental Affairs.
H. E. Schwarz.
Journal of the Water Resources Planning and Management Division. Proceedings of the American Society of Civil Engineers, Vol. 105, No. WR1, p 27-38, March 1979. 1 fig, 15 ref.

Descriptors: *Water resources, *Planning, *Water plans, *Potomac River basin, *NAR study, *Changes, Government agencies, Effects, Economics, Water supply, Water quality, Benefits, Evaluation.

Planning techniques and procedures have changed greatly in the last 20 years. They have changed because: (1) the techniques of analyses have altered; (2) the institutional setting for planning has varied; and (3) society's values have changed. A review of three cases shows these changes and their evolution: the North Branch of the Potomac report (1961); the Potomac River basin report (1963); and the North Atlantic Regional Water Resources Study report (1973). For each case, the techniques and procedures used in Plan Formulation, Plan Evaluation, Objective Setting, and Decision Making are reviewed. The paper concludes that excellent planning is possible and can become probable if institutional development keeps apace with the developing planning methods. (Bell Graf-Cornell)

ECONOMICS AND WATER RESOURCES PLANNING IN AMERICA,
Utah Water Research Lab., Logan.
L. D. James, and J. R. Rogers.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 105, No WR1, p 47-64, March 1979. 66 ref.

Descriptors: Water quality control, *Water plans, *Cost-benefit analysis, *Economics, *History, *Fishing mills, *Social participation, Flood control, Hydroelectric power, Irrigation, Public works, Legislation, Navigation, Natural resources, Projects, Decision making, Design, Programs.

In the United States, the year 1776 marked the beginning of a government dedicated to the development of abundant unclaimed resources for benefit of the common people. It also marked the publication of Wealth of Nations by Adam Smith as the beginning of modern economics. Since then, proponents and opponents of project development schemes for navigation, irrigation, flood control, hydroelectric power, and water quality have seeked economic arguments to support their positions. While economic comparisons have gained widespread application in project design, they have seldom decided project selection. In order to get away from using economics at the project selection level largely to defend decisions already made, economic analysis needs to be restructured by more effective use of the information storage and retrieval capabilities of modern computers so that relevant information from any view point can be quickly provided to people or communities making water management decisions. The goal is to get crusaders to listen to facts before committing themselves and society. (Bell Graf-Cornell)

SOCIAL ASPECTS OF WATER RESOURCES PLANNING,
Miami Univ., Oxford, OH. Inst. of Environmental Science.
G. E. Willeke.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 105, No WR1, p 79-90, March 1979. 18 ref.

Descriptors: *Water resources, *Social aspects, *Planning, *Public works, *Social needs, *Social impact, Dams, Economic analysis, Groundwater, Cannel coal, Levees.

Although social goals have always been considered to some extent in major water programs, treating social concerns in a systematic manner is a recent feature of water planning. This reflects the legal requirements for assessing social impacts, a growing understanding of social systems, and recognition that planning is more effective when social factors are considered. From 1776 to 1925, water management structures were small and there was little Federal involvement. Although planning methodology was meager, social factors were given substantial attention. From 1925 to 1960, an era of building large water management structures, there was a strong belief in the efficacy of structural solutions. From 1960 to the present, evidence has accumulated on adverse effects of projects in such magnitude that planning procedures and goals have been modified to give greater attention to equity and social impacts. Public involvement in planning has been mandated. These developments appear to be leading towards the end of the long separation of the social sciences and engineering. (Bell Graf-Cornell)

ECONOMIC ASSESSMENT OF STORM DRAINAGE PLANNING,
Science and Education Administration, Beltsville, MD. Hydrograph Lab.
W. J. Rawls, and R. H. McCuen.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 104, No WR1, p 45-54, November 1978. 8 fig, 15 ref.

Descriptors: *Water management(Applied), *Storm sewers, *Urbanization, *Drainage, *Economic analysis, Planning, Hydrology, Detention reservoirs, Costs, Urban development, Assessment, Economic efficiency, Design, Effects, Metropolitan areas.

Factors that planners must consider in the economic evaluation of storm drainage system alternatives include the scale of development, the degree of protection, and the option for including detention storage. A planning tool that requires a limited data base is presented for use in evaluating various possible designs and the effect on total cost of imperviousness, design return period, and the time of concentration. The utility of the above planning tool is demonstrated for three areas: Washington, D.C.; Dallas, Texas; and Los Angeles, California. Improvement in the efficiency of storm drainage systems will reduce both the total cost and the hydrologic impact of development. Both structural measures--such as detention storage--and nonstructural measures--like open space ponding and grass-lined swales--improve the efficiency of storm drainage systems. The effect on cost of increases in the time-of-concentration is examined as an indicator of the efficiency of storm drainage alternatives. (Bell Graf-Cornell)

CONOMIC ANALYSIS OF STRUCTURAL LOOD PROOFING,
olorado Univ., Boulder. Dept. of Civil, Environental, and Architectural Engineering.
E. Flack.
ournal of the Water Resources Planning and Mangement Division, Proceedings of the American ociety of Civil Engineers, Vol 104, No WR1, p 1-221, November 1978. 2 fig, 4 tab, 5 ref.

escriptors: *Flood control, *Cost-benefit analys, *Floodproofing, *Waterproofing, Flood routg, Urban planning, Structural, Economic analys, Annual, Residential, Commercial, Flood mage.

n economic analysis of flood proofing was apied to a case study of residences and commercial tablishments in the Boulder Creek flood plain of oulder, Col. Two alternate plans (one involving ne and the other four items of flood proofing) ere analyzed in terms of their costs of installation d the benefits derived from reduced flood damges. Data on levels of inundation for floods up to e 100-yr flood were obtained for each structure the flood plain from field surveys. Costs of flood roofing were estimated from standard construcon cost references. Damages were based on andardized flood depth-damage relationships for e structure and its contents. The results indicate at, in general, flood proofing all structures in a ood plain, such as Boulder Creek, is not economilly justified, but that on an individual structure sis some residences and many commercial establhments can be flood proofed at costs less than e benefits derived. MANUAL FOR EVALUATING SECONDARY IMPACTS OF WASTEWATER TREATMENT FACILITIES,
Abt Associates Inc., Cambridge, MA.
M. FitzPatrick, J. Willson, D. Ericson, G. Fax, and D. Wood.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 153, Price codes: A09 in paper copy, A01 in microfiche. Report No. EPA-600/5-78-003, April 1977. 184 p, 30 fig, 176 ref. 68-01-3268.

Descriptors: *Waste water treatment, *Treatment facilities, *Publications, *Environmental effects, *Evaluation, *Assessment, Future planning(Projected), Water quality, Surface waters, Groundwater, Economic impact, Wetlands, Wildlife, Habitats, Coasts, Floodplains, Parks, Land use.

Guidelines to aid in assessing the secondary impacts of waste water treatment facility construction are presented. This guide, intended for local officials, EPA Regional staff, and State officials, gives the range of potential secondary impacts, and describes current EPA policy and regulations governing analyses of these impacts. The assessment task is twofold: growth and land use projection, and estimation of environmental impacts resulting from waste water treatment facility induced growth. The 14 areas of secondary impacts covered are categorized into four groups: media impacts, such as ambient noise levels; sensitive environmental area impacts, such as floodplains; unique area impacts, such as parklands; and secondary economic impacts, such as property values. Approaches to refine and improve existing projections of amount, type, and location of projected growth in a service area are described. Application of these approaches is provided for various levels of sophistication, consistent with analysis capability and available resources. Procedure for conducting an initial assessment of the relative seriousness of the 14 types of impacts listed is given. (Davison-IPA)

PRELIMINARY ECONOMIC ANALYSIS OF SOLAR IRRIGATION SYSTEMS (SIS) FOR SELECTED LOCATIONS,
Sandia Labs., Albuquerque, NM. Dept. of Systems Analysis.
L. L. Lukens, A. M. Perino, and S. G. Vandevender.
Available from the National Technical Information Service, Springfield, VA 22161 as SAND 77-1403, Price codes: A03 in paper copy, A01 in microfiche. Report No. SAND 77-1403, November 1977. 49 p, 25 fig, 27 tab. AT (29-1)-789.

Descriptors: *Irrigation systems, *Solar irrigation systems, *Irrigation operation and maintenance, *Economic feasibility, Cost analysis, Comparative costs, Electric power costs, Capital costs, Research and development, Agriculture, Crops, Soil types, Evaluation.

A preliminary analysis of the economic feasibility of stand-along solar irrigation systems for certain applications in various locations is described. The life cycle cost (LCC) of the solar irrigation system was compared to the life cycle cost of conventional systems to determine economic feasibility. The LCC of a stand-alone SIS in southern Arizona is 1.5 to 3 times greater than that of a conventional electric system when based on operation for irrigation only between 1980 and 1990. The SIS becomes competitive when 100% of the system capacity is utilized throughout the year, indicating that solar irrigation can be made feasible if the systems can be incorporated into the farm as a power or heat source rather than an irrigation only energy source. Results of SIS designed for five other areas show that SIS LCC is greater than that of electricity as follows: 2 to 4 times higher in the San Joaquin Valley, California; 3.5 to 6.5 times higher in northwestern Nebraska; 2.5 to 5 times higher in central New Mexico; 4.5 to 9 times higher in southeastern Oregon; and 2 to 4 times higher in the southern High Plains of Texas. A hybrid system, solar power with an electrical backup, was examined for southern Arizona. In this case the hybrid becomes economical by 1990 without government incentives or utilization of the total system capacity during the off-season, indicating that SIS should not necessarily be designed for self-sufficiency. CHESAPEAKE BAY FUTURE CONDITIONS REPORT VOL. 10, APPENDIX 13: ELECTRIC POWER, APPENDIX 14: NOXIOUS WEEDS,

Army Engineer District, Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A052 480, Price codes: A03 in paper copy, A01 in microfiche. (1977) 169 p, 20 fig, 18 tab, 76 ref.

Descriptors: *Chesapeake Bay, *Electric power, *Aquatic plants, *Future planning(Projected), *Aquatic weeds, Electric power demand, Electric power industry, Electric power plants, Submerged plants, Pond weeds, Aquatic weed control, Rooted aquatic plants, Sago pondweed, Herbicides.

The impacts of electrical power on the development of the Chesapeake Bay area are discussed in appendix 13. Historical progress, present developments, and future needs and potentials are presented. Historical patterns of energy consumption were analyzed according to current developments in the power industry within a defined market area and its sectors. Future power demands in the market area were estimated through the year 2020. Land and water use were identified as related to the generating capacity mix required to supply the estimated demand. Generating plants were sited through the year 2000 and associated water use was identified. In appendix 14 the types of problems associated with excessive growths of aquatic plants in the Bay and its tributaries are reported. The various types of aquatic plants and the factors affecting their growth are discussed. Past problems involving noxious weeds in the Bay area are surveyed. Pertinent control measures and the advantages and disadvantages of their use are reviewed. (Davison-IPA)

IRRIGATION PLANNING BASED ON WATER DEFICITS,
Southampton Univ. (England). Inst. of Irrigation Studies.
J. R. Rydzewski, and S. Nairizi.
Water Resources Bulletin, Vol. 15, No. 2, p 316-325, April 1979. 3 fig, 1 tab, 6 ref.

Descriptors: *Irrigation, *Projects, *Simulation analysis, *Water deficits, *Underwatering, Planning, Crop yield, Water costs, Cost-benefit analysis, Economic efficiency, Computer models, Effects, Timing, Irrigation water, Water supply, Methodology, Optimization, Systems analysis, Design capacity, Benefit maximization, Equations.

The deliberate underwatering of a larger land area, as practiced in Southern Asia, has provided impetus for systematic investigation into the effects of designing projects for crop water deficits on benefit-cost performance. The study began with the derivation, from published experimental results, of functions relating ultimate crop yield to the magnitude and timing of water deficits, i.e., of the productivity of irrigation water. To obtain the net benefit of the project, the relation between the harvested area and output and the on-farm production costs was then suggested. The cost of supplying the irrigation water to the proposed area and of distributing and applying it to the field was determined, thus completing the benefit-cost equation. A computer simulation model was then established to search for the irrigation project design capacity and area to maximize the net present value in the benefit-cost analysis for the development proposed. In all three cases studied, there appeared good evidence that deliberate underwatering over an extended land area could produce economic (or financial) benefit, this being particularly marked with supplementary irrigation when using mechanized units. EVALUATION OF ALTERNATIVES TO THE GARRISON DIVERSION UNIT,
Waterloo Univ. (Ontario). Dept. of Systems Design.
N. M. Znotinas, and K. W. Hipel.
Water Resources Bulletin, Vol. 15, No. 2, p 354-368, April 1979. 9 tab, 15 ref.

Descriptors: *Evaluation, *Multiple-purpose projects, *Water resources development, *Benefits, *Canada, *Garrison Diversion Unit, *Comparison techniques, River basins, Farms, Irrigation, North Dakota, Environmental effects, Decision making, Systems analysis equations, Missouri River, Fuzzy sets, International Joint Commission, Engineering designs, Intagible factors, Qualitative information, Senitivity.

The Garrison Diversion Unit is a multipurpose water resources project which is currently under development for the purpose of diverting water from the Missouri River basin to irrigate farmland in North Dakota. Due to the objections raised by various interest groups, the project has recently been reviewed by the International Joint Commission. This article surveys the background to the project and the various alternatives that have been proposed. By utilizing recently developed fuzzy set techniques, the proposed alternatives are evaluated and a plausible solution is offerred. The study results indicate that it may be advisable to remove the Souris Loop irrigation area from the Garrison project, but the environmental impacts of the study may preclude the implementation of any alternative that can affect Canada. These findings are in partial agreement with the recommendations of the International Joint Commission. (Bell Graf-Cornell)

WILD RIVERS--METHODS FOR EVALUATION,
M. B. Sonnen, and L. C. Davis.
Water Resources Bulletin, Vol 15, No 2, p 404-419, April 1979. 7 fig, 5 tab, 21 ref.

Descriptors: *Wild rivers, *Evaluation, *Methodology, *Benefits, *Water resources economics, *Analytical techniques, Costs, River basins, Environmental effects, Washington, Equations, Recreation, Irrigation, Intangible values, Low development levels, Benefit maximization, Monetary benefits, Nonmonetary benefits.

Two analytical methods are presented and demonstrated for evaluating the monetary and nonmonetary benefits of wild rivers. In the traditional benefit-cost context, special techniques are required to show that any wild river is worthy of preservation. The methods presented allow for the possibility of low development levels in river basins to be optimal, although advanced development can also be shown to be most efficient in some circumstances. That is, the methods are not directed to the wild condition only, but to the entire spectrum of development possibilities. The applications of the methods to two adjacent subbasins in the State of Washington each showed that the currently undeveloped basin should be left in its wild condition, while the partially developed basin next door should be developed even more fully.(Bell Graf-Cornell)

FUZZY SET APPROACHES TO PLANNING IN THE GRAND RIVER BASIN,
Waterloo Univ. (Ontario). Dept. of Systems Design.
H. Alley, C. P. Bacinello, and K. W. Hipel.
Advances in Water Resources, Vol. 2, No. 1, p 3-12, March 1979. 1 fig, 9 tab, 10 ref.

Descriptors: *Alternative planning, *Decision making, *Grand River basin(Ontario Can), *Cost effectiveness, *Dominance matrix, Water resources, Effects, Design, Data collections, Equations, Systems analysis, *Fuzzy set techniques, Questionnaires, Ranking, Interest groups, Pessimistic aggregation, Mean aggregation, MacDonald analysis.

Fuzzy set approaches are used to analyze alternative solutions to a water resources planning problem in the Grand River basin in Ontario, Canada. The output from questionnaires which were answered by local politicians and other interested parties, provides input data to fuzzy set analyses. The fuzzy set techniques are designed such that non-quantitative and quantitative factors, and the viewpoints of the interest groups, can be readily incorporated into the decision-making process. Ranking of the alternatives is achieved through the use of a dominance matrix which is designed for this purpose. By comparing the ratings of each alternative in the fuzzy set analyses to the cost of the alternative, a comparison is made among the alternatives based upon cost effectiveness. The reasonable results obtained for the Grand River basin application confirm the efficacy of the fuzzy set procedures. (Bell Graf-Cornell)

DEW, FOG AND HYGROSCOPIC FOOD AS A SOURCE OF WATER FOR DESERT ARTHROPODS,
Hebrew Univ., Jerusalem (Israel). Dept. of Entomology.
M. Broza.
Journal of Arid Environments, Vol. 2, No. 1, p 43-49, March 1979, 3 fig, 2 tab, 19 ref.

Descriptors: *Dew, *Fog, *Hygroscopic water, *Invertebrates, *Water balance, Nutrient requirements, Environmental effects, Condensation, Microenvironment, Insect behavior, Moisture stress, Water requirements.

Certain species of desert arthropods are distinguished by their ability to utilize dew and damp hygroscopic material as a source of moisture. The present paper reports the results of field experiments carried out in arid region of Israel to demonstrate how these water sources are exploited by species of isopods, ants, bugs, carabid, coccinellid and several tenebrionid beetles. Numerous investigations of strips of ground in the area were conducted and microclimatological measurements made at the beginning of each observation period. Presented here is a description of one typical night and early morning observation on October 12, 1972 in which two relevent phenomena were observed: (1) direct drinking of dew drops and (2) eating of hygroscopic material which had absorbed water during the night. Observations were carried out immediately after the end of a heat wave and the amount of water gained by tenebrioned beetles following the intake of hygroscopic material was measured and found to be substantial from a summary of data on the occurence of dew and fog in the desert area of Israel, it is concluded that these sources of water could meet the water requirements of many desert arthropods. LOCATION OF MUNICIPAL WELL FIELDS IN AN ENVIRONMENTALLY SENSITIVE REGION,
Geraghty and Miller, Inc., Tampa, FL.
F. H. Dave, and P. J. Schreuder.
Water Resources Bulletin, Vol. 15, No. 2, p 326-336, April, 1979. 4 fig, 10 ref.

Descriptors: *Groundwater, *Water wells, *Wellfields, *Sites, *Environmental effects, Planning, Regional analysis, Florida, Leakance, Water table, Interference.

Potential well-field locations for Hillsborough, Pasco, and Pinellas counties in west-central Florida were determined with a visual selection technique. This technique is based on an understanding of regional hydrology and an appreciation of development goals such as the location of high-yield and low-impact sites. Site-selection criteria include: leakance, depth to water table, depth to nonpotable

ater, change in the potentiometric surface, and ojected well-field interference. Overlays of each iterion are combined to form a regional compos- showing favorable site locations. The actual e-specific values for transmissivity, leakance, orage coefficient, specific capacity, and water ality at the selected locations are determined rough a testing program. This technique, with odifications, can be used in other geographic gions. (Purdin-NWWA)

escriptors: Legislation, Planning, *Water alloca- on, *Water conservation, Public opinion, Poli- es.

his project was concerned with public and legis- tive attitudes about water, energy, environment d other public policy issues. In the area of water source allocation and development our analysis s shown that, despite all the pressures for ange, neither voters nor legislators are willing to k that any particular users cut back in their use of ater. Even irrigated agriculture, which currently es ninety percent of the water in the region, has e support of the vast majority of both voters and gislators to continue to use the same or more ater in the future. This unwillingness to reallo- te water away from agriculture to municipal, dustrial and other uses exists despite the fact that large majority of the people polled feel that ater shortages are a serious problem. We con- ude by suggesting that there will be little change om present water policies if the direction of ture water politics is left to these Western voters d their elected state representatives.

his discussion is based upon the recognition that ere are and increasingly will be pressures to evelop regional impact measures for fishery olicy decisions. The issue of conceptual and em- pirical differences between the willingness to pay market value approaches to deriving value esti- mates is bypassed. Instead, the groundwork has been laid for improved regional analysis to fisher- ies decisions. Concern has been indicated with standard input-output models and even with the applicability of dynamic input-output models to regional questions. Also, any model that cannot identify economic activity generated from nonpro- ductive transaction costs will provide misleading implications. It is concluded that the appropriate approach is one based on econometric relationships and which allows for dynamic and simultaneous adjustment in relevant variables and even coeffi- cients. Presented as an example is the Harris Model, indicating how its concept of location rent can be adapted to consider regional fisheries ques- tions. It is believed that given the model, the planned adjustments, and appropriate data, the re- sults can provide an important input into many regional issues. It is necessary to account properly for changes in economic activity before net bene- fits can be derived. (Bell Graf-Cornell)

THE EFFECT OF INLAND NAVIGATION USER CHARGES ON BARGE TRANSPORTA- TION OF WHEAT,
Virginia Polytechnic Inst. and State Univ., Blacks- burg. Dept. of Agricultural Economics.
J. K. Binkley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-295 632, Price codes: A13 in paper copy, A01 in microfiche. Ph.D. Dissertation, April, 1977, 288 p, 26 tab, 22 fig, 43 ref, 5 append. OWRT B-082-VA (1).

Descriptors: Mississippi River, Inland waterways, *Transportation, *Wheat, User charges, Transship- ment models.

This study evaluated the effect of inland naviga- tion user charges on barge wheat movements on both the Mississippi River system and particular segments of the system. In order to accomplish these objectives, transshipment models were con- structed, examining three wheat varieties: hard red spring, hard red winter, and soft red winter. The models permitted two types of movements from producing to consuming areas: direct movements or movements through river transshipment points. This allowed the models to choose between barge transportation and competitive modes. Consuming regions were comprised of domestic milling points and foreign countries. Exports to any given point were allowed to move through any of several U.S. ports, depending upon relative transport costs. This gave the models a great deal of flexibility in the export sector, which is critically important for barge transportation of wheat. Data used included 1970-71 wheat production and consumption, and 1975 barge and rail rates, truck costs, and handling costs for each mode. User charges were based on 1974 operation and maintenance costs of the inland waterway system and 1974 barge ton-miles. Base solutions were obtained for each of the models, and then each was run with user charges recover- ing from 25 to 500 percent of annual operation and maintenance. The effects of uniform charges and charges specific to each waterway were examined.

Bankers Trust Co., New York.
C. R. Grebenstein, and B. C. Field.
Water Resources Research, Vol. 15, No. 2, p 228- 232, April 1979. 3 tab, 29 ref.

Descriptors: *Water, *United States, *Elasticities of substitution, *Manufacturing sector, Estimating, Capital, Labor, Water prices, Equations, Math- ematical models, Systems analysis, Aggregate pro- duction functions, Trans-log cost function, Water demand.

Partial elasticities of substitution among capital, labor, and water provide evidence concerning the possibilities of adjusting the techniques of manufac- turing to accommodate changing scarcities of water. Empirical estimates of elasticities for the United States are obtained by using a trans-log cost function with SIC two-digit manufacturing data for 1973. Results show that water and labor inputs are good substitutes but that water and capital are complements. Economic implications of this find- ing are discussed. (Bell Graf-Cornell)

OPTIMAL WATER PRICING AND STORAGE WITH CYCLICAL SUPPLY AND DEMAND,
California Univ., Los Angeles. Dept. of Econom- ics.
J. G. Riley, and C. R. Scherer.
Water Resources Research, Vol. 15, No. 2, p 233- 239, April 1979. 1 fig, 19 ref, 1 append.

Descriptors: *Water supply, *Pricing, *Water demand, *Water storage, *Reservoir operation, *Planning, *Optimization, Constraints, Investment, Mathematical models, Systems analysis, Equations, Economic efficiency, Lagrangian analytical frame- work, Storage capacity, Marginal cost, Peak pric- ing.

Optimal storage of a naturally renewable, seasonal- ly varying resource is considered where demand is price sensitive and seasonal and social resources are required for storage and processing prior to consumption. The particular application is water supply, where the demand and supply fluctuations are generally out of phase. Using a Lagrangian analytical framework, net willingness to pay is maximized subject to fundamental constraints that characterize water supply and storage. The pur- pose of this work is to integrate the literatures of peak load pricing and optimal reservoir planning and operation, noting that price is both an active form of 'soft' demand management and an effective information signal for efficient allocation of (non- water) resources in the management of water supply. Results indicate that although demand is assumed to vary continuously with time, the opti- mal rate structure is approximated by a policy in which the price of water is adjusted at only a few points in the cycle. In contrast with the usual discrete time model, the duration of each subper- iod of constant pricing is endogenously deter- mined. It is also shown that owing to the introduc- tion of storage, off-peak prices as well as the peak season price may be held above marginal operating costs, thereby bearing part of the capacity costs. (Bell Graf-Cornell)

6D. Water Demand

ESTIMATION OF RESIDENTIAL WATER DEMAND,
North Carolina State Univ. at Raleigh. Dept. of Economics and Business.
L. E. Danielson.
Economics Research Report No 39, October 1977. 73 p.

Descriptors: *Water demand, *Water supply, *Water rates, *Statistical models, Use rates, Least squares method, Correlation analysis, Time series analysis, Econometrics, Regression analysis, Eco- nomics, Peak pricing, Raleigh(NC), Residential water use.

The general purpose of this study is to estimate water demand equations and to analyze whether the policies of peak-load pricing and supply rationing through price adjustment will have an appreciable effect upon water demanded at the household level. The study presents a review of the literature on estimation and projection of water use. The study data are a set of both cross-section and time series meter readings of monthly water use from a sample of residential households in the city of Raleigh, N.C., for the period May 1969 to December 1974. The report discusses the assumptions and applications of the classical least squares model, the covariance model, the random error components model, and the correlated error models. The economic model used in the analysis consists of residential use of water per household as the dependent variable; and average daily rainfall per period, average daily temperature per period, appraised value of house and lot, water price, and size of household as the independent variables. Total residential demand for water is that total quantity of water consumed in a given period for all residential purposes. Other dependent variables include winter demand and sprinkling demand for water. Generally, sprinkling demand was found to be highly responsive to changes in the level of the climatic variables and water price. Household size explained the largest proportion of the variation in the data. The results of this study will aid in evaluating the effect of pricing schemes upon water demand and estimating whether or not such policies should be adopted. (Coan-NC)

PROPOSED 7 YEAR WATER SUPPLY PROGRAM, STATE OF VERMONT.
Vermont State Agency of Environmental Conservation, Montpelier. Div. of Environmental Engineering.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 260, Price codes: A05 in paper copy, A01 in microfiche. January 1974, 74 p, 2 fig, 20 tab, 4 append.

Descriptors: *Water resources planning, *Water supply, *Water supply development, *Water utilization, *Water costs, Legislation, Construction costs, Water pollution, Economics, Municipal water, Water quality, Water treatment, Water use, Waste water disposal.

This report evaluates two water supply program changes in Vermont and provides a 7-year projection of costs with a proposal for State assistance for municipal water supply systems. In January 1973 the local assistance federal grant programs for water and sewer system construction funded by the Farmers Home Administration and Dept. of Housing and Urban Development were terminated. These construction grants provided 50% of project costs, with State construction grants of up to 35%. Fifteen communities have been ordered to boil their water, and an additional 71 communities have been ordered to undertake major improvements in their water systems. In addition, 26 communities have been identified as requiring minor improvements. These projects would result in a $75 million construction program; the absence of Federal assistance makes construction of such 'complete projects' economically unfeasible. In the absence of Federal aid, and to help municipalities with public health hazards, those municipalities having the most critical problems are distinguished from the remainder according to the criteria of level of acceptable water quality, extent of covered storage to prevent water contamination, minimum storage capacity to meet demand, and extent of interconnection of system with existing distribution systems. Under these criteria, such 'minimum acceptable project' costs are estimated to be $35,750,000, with the state supplying 70% of the funds. It is recommended that applicable state legislation be amended to award water supply development funds only to municipalities with urgent needs, and that allocation of funds be determined on a dollar amount basis rather than the present percent basis. Proposed legislation is presented. (Arnold-NC)

DEMAND PROJECTIONS CONSIDERING CONSERVATION,
M. B. Sonnen, and D. E. Evenson.
Water Resources Bulletin, Vol 15, No 2, p 447-460, April 1979. 8 fig, 6 ref.

Descriptors: *Water conservation, *Water demand, *Forecasting, Hawaii, Water supply, Planning, Prices, Mathematical models, Systems analysis, Equations, Effects, Use patterns, Outdoor demands, Family residences, Rainfall, Elasticity, Land use.

Prediction of future water demands depends on the degree to which conservation effects can be anticipated. A model developed for the Corps of Engineers shows that choosing a numerical conservation target to be achieved is more meaningful and yields more predictable results than price or price elasticity manipulations. The method developed and then applied to the Kaneohe Bay region of Oahu considers the following determinants of demand: geographic distribution of the users, indoor and outdoor requirements, time (by year and month of the year), precipitation, historical unit usage rates, gross and irrigable acreage of land uses, price for water, elasticity of demand with respect to price, source of the water supply (local private supplies vs. agency supplies), and the percentage conservation savings anticipated in each future period in indoor and outdoor uses of water in each of 40 possible land uses. (Bell-Graf Cornell)

WATER RESOURCES OF THE POTOMAC RIVER BASIN, WEST VIRGINIA,
Geological Survey, Morgantown, WV. Water Resources Div.
W. A. Hobba, Jr., E. A. Friel, and J. L. Chisholm.
West Virginia Geological and Economic Survey River Basin Bulletin 3, 1977. 110 p, 48 fig, 3 plates, 30 tab, 56 ref.

Descriptors: *Water resources, *West Virginia, *Potomac River, *Groundwater resources, *Water quality, Available water, Water supply, Water demand, Hydrologic data, Streamflow, Runoff, Low flow, Aquifers, Water wells, Water yield, Floods, Surface-groundwater relationships, Groundwater recharge, Water analysis, Chemical analysis, Planning, Water resources development.

This report presents basic information and interpretations regarding the occurrence, availability, and quality of the water resources of the Potomac River basin in West Virginia. The basin includes an area of 3,464 square miles or about 15 percent of the State. The present population is 125,500. Considerable future increases in population, with increases in recreational and industrial expansion, are anticipated. Thus, a knowledge of the water resources is essential in proper planning for development. Virtually all water in the basin is derived from precipitation. Average annual precipitation is 38 inches per year; of this amount 25 inches is returned to the atmosphere by evapotranspiration, 8 inches becomes ground-water recharge, and 5 inches becomes direct overland runoff. Average annual streamflow is 0.9 cubic feet per second per square mile. The carbonate rocks of Berkeley and Jefferson Counties are the best aquifers and may yield more than 600 gallons per minute to individual wells tapping cavernous zones. The shale rocks of the central part are generally the poorest aquifers. The chemical quality of both surface water and ground water is very poor to excellent, depending on location. (Woodard-USGS)
W79-06813

PUBLIC AND INDUSTRIAL WATER SUPPLIES OF NORTHERN MISSISSIPPI, 1975,
Geological Survey, Jackson, MS. Water Resources Div.
J. A. Callahan.
Mississippi Board of Water Commissioners Bulletin 79-1, 1979. 79 p, 7 fig, 49 tab, 35 ref.

Descriptors: *Water supply, *Surface waters, *Groundwater, *Water quality, *Water utilization, Hydrologic data, Aquifers, Well data, Water levels, Water yield, Water demand, Water analysis, Chemical analysis, Municipal water, Industrial water, *Northern Mississippi.

Public and industrial water withdrawals for the 45 counties of northern Mississippi amounted to more than 520 million gallons per day in 1975. Water usage was divided about equally between groundwater and surface-water sources. Ground-water pumpage for public supplies and self-supplied industry was 78 and 143 million gallons per day, respectively. Rural water use was 12 million gallons per day exclusive of irrigation. Of the total usage, 291 millions gallons per day was from surface-water sources primarily for cooling water. Industrial water is obtained from Lake Ferguson and the Sunflower River. The city of Columbus, pumping from Luxapallila Creek, is the only public supply using surface water; all other public supplies are obtained from wells. Producing aquifers ranged in age from Paleozoic to Holocene. The most widely used aquifers are the Meridian-upper Wilcox and the Sparta Sand, both of Eocene age. The largest withdrawal, over 74 million gallons per day, is made from the Mississippi River Valley alluvial aquifer. (Woodard-USGS)

WATER QUALITY MANAGEMENT PLANNING IS NOT COMPREHENSIVE AND MAY NOT BE EFFECTIVE FOR MANY YEARS.
Comptroller General of the United States, Washington, DC.
U.S. General Accounting Office, Publication No CED-78-167, December 11, 1978. 49 p, 7 append.

Descriptors: *Federal Water Pollution Control Act, *Water quality, *Water quality control, *Regulation, *Water quality standards, *Water management(Administrative), *208 planning, Planning, Water pollution control, Water law, Water pollution, Water resources.

In this report to the House of Representatives, the General Accounting Office (GAO) analyzes the effectiveness of Implementation of the 208 water quality planning program by the U.S. Environmental Protection Agency (EPA) since passage of the 1972 Federal Water Pollution Control Act (P.L. 92-500). Findings indicate that EPA's management of the 208 program has been costly and that more

ffective agency planning with regard to standards etting and funding for state programs is needed. nitial funding for state 208 programs did not occur ntil more than a year after passage of P.L. 92-500, nd after funding EPA did not vigorously follow hrough in seeing that states meet requirements of ection 208 on time, due to inadequate time frames mposed on states in the first place. GAO recom-nends that public participation play a more impor-ant role in the 208 planning process, and that EPA hould reassess the 208 program and report to Congress on how long it will take to get adequate ata on future effective program planning, and vhat planning alternatives to the 208 program are ossible. Greater special interest group involve-ent is also recommended. Oregon's 208 program s cited as a model partly due to that state's effi-ient use of remote sensing and aerial photography ata to determine river basin water quality prob-ems earlier in the stages of its program. Descriptors: *Irrigation, *Columbia River Basin, Effects, *Water law, Washington, Oregon, Tech-ology, Investment, Capital, Markets, Thermoelec-ric energy, Institutions, Socioeconomic character-stics, Small towns.

As of 1976, over 225,000 acres were being irrigated by center pivot units in a five-county area of the Columbia Basin in Oregon and Washington. Most of the development occurred since 1970. Dynamic pplication of center pivot technology altered the oncept of irrigability in the study area, converting ands that were often rolling, sandy, and plagued by wind erosion from low grade grazing to pro-luctive irrigated units. This development was en-irely by private enterprise, with large corporate arms accounting for much of the effort. Little rior comprehensive planning or coordination took lace. When the circulation of water is altered on uch a massive scale, however, unplanned impacts nay be far reaching. In this case they include: (1) cceleration of the shift to high cost thermoelectric eneration; (2) alteration of the state institutions esigned to allocate water; and (3) possible signifi-ant alterations of the socio-economic fabric of mall rural service centers. STATE WATER QUALITY CONTROL PRO-GRAM IN ARIZONA,
Arizona State Dept. of Health, Phoenix. Environ-nental Health Service.
R. L. Miller.
Water Resources Bulletin, Vol. 14, No. 6, p 1503-1506, December 1978.

Descriptors: *Water quality conrol, *Programs, *Arizona, *Legislation, Public law, Point source, Nonpoint source, Standards, Areawide planning, Plan review, Facilities inspections, NPDES, En-forcement, Operator certification, Monitoring, Construction grants.

Arizona's water pollution control program is based on authorities of Arizona Revised Statutes and Public Law 92-500, the Federal Water Pollution Control Act Amendments of 1972. The primary areas of this program are monitoring, facility in-spections, plan review, planning, discharge permits and grants for the construction of publicly owned waste water treatment facilities. The discharge permit program deals with control of point-source discharges and is administered by the United States Environmental Protection Agency. The planning and construction grants programs are administered by the State Water Quality Control Council and are implemented by the Bureau of Water Quality Control, which serves as staff to the Council. There are several challenges that face the State in this program. First is the adaptation of the 'eastern law' to deal with Arizona's water quality prob-lems. Second is to address problems caused by a long history of 'laissez-faire' environmental quality management. Third is a mutual cooperation and coordination among the many entities involved in water quality standards and the involvement of people of diversified backgrounds in the field of areawide planning under Section 208 of the Feder-al Water Pollution Control Act, which is primarily concerned with non-point sources of water pollu-tion. WATER RESOURCES PLANNING--HISTORI-CAL DEVELOPMENT,
National Research Council, Washington, DC. Environmental Studies Board.
T. M. Schad.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 105, No. WR1, p 9-25, March 1979. 55 ref.

Descriptors: *Water resources, *Planning, *Statistical analysis, *Government agencies, *Public works, *History, Waterways, Estimating, Water policy, Forecasting, Conservation, Navigation, Transportation, United States, U.S. Corps of Engineers.

Water resources planning in the United States had its origin in efforts to improve waterways for navigation. Early planning was accomplished by the U.S. Army Corps of Engineers in connection with the construction of projects. Growth and development of the country led to a proliferation of government agencies involved in water re-sources, and the planning process gradually in-creased in complexity. The 'New Deal' in the 1930's resulted in increasing centralization of plan-ning, but in the 1960's an effort was made to regionalize the planning process. Various commit-tees and commissions have made recommendations for improvement of the planning process, and the planning techniques continue to evolve. The point has now been reached where many years of plan-ning are required before a project can be devel-oped to meet a perceived demand for water or water-related services. (Bell Graf-Cornell)

GROUNDWATER LAW,
K. Browning.
Pacific Groundwater Digest, Vol. 2, No. 3, p 29-30, March, 1979.

Descriptors: *Groundwater, *California, *Water management(Applied), *Legislation, *Ground-water basins, Water resources, Financing.

New groundwater legislation in California will re-quire the State Water Resources Board to desig-nate groundwater management areas, conduct groundwater resources investigations, and make recommendations for groundwater management areas. In addition, each area will be controlled by a local groundwater management authority who will submit a comprehensive management plan and send biennial reports to the governing board. These authorities will be financed through ground-water extraction charges and basin equity assess-ments. Other states, such as Nevada and Oregon are divided into groundwater basins. The State Water Resources Board studies and monitors the amount of discharge and recharge in each basin and have the authority to halt usage of ground-water only in critical areas. (Purdin-NWWA)

SAN LUIS VALLEY WATER PROBLEMS: A LEGAL PERSPECTIVE,
Colorado State Univ., Fort Collins. Dept. of Eco-nomics.
G. E. Radosevich, and R. W. Rutz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-295 918, Price codes: A06 in paper copy, A01 in microfiche. Colorado Water Resources Research Institute, Colorado State University, Information Series No. 34, January 1979. 109 p, 8 append. OWRT C-7144(6211)(1). 14-34-0001-6211.

Descriptors: *Water rights, Water law, Interstate compacts, *Irrigation, Institutions, Colorado, San Luis Valley, Rio Grande River.

The San Luis Valley stands at the crossroads of its economic future. Because of the existing water distribution system in the Valley and the superim-posed legal system and legal constraints, a deep insecurity has arisen among the people. Suspicion and economic fear are facts of life. As a result, a number of lawsuits have been filed during the past year, thereby deepening the division already pres-ent and draining large amounts of money out of the Valley to law firms located primarily in Denver. Presently, the Valley is a patchwork of local con-servancy districts, ditch companies, drainage dis-tricts, water users associations, etc., all interested in protecting their own areas of concern at the expense of any other person or group which might be deemed a threat to their interest. With the Closed Basin Drainage Project beginning, it is possible that there is enough water present in the Valley to fulfill existing water requirements with-out substantially harming the existing pattern of water use. To approach this objective a spirit of cooperation and trust must be developed, and a basic review of the legal principles controlling water must be made. The purpose of this report is to describe the water law condition and problems in the Valley. The following areas are discussed: the Rio Grande River and Colorado's commit-ments thereunder; the Closed Basin Project; Water Rights and Organizations in the Valley; Problems and Conflicts in the Valley; Developments in Colorado Water Law since 1973; and An approach to resolving the water problems now and in the future.

FRAGMENTATION OF PUBLIC AUTHORITY OVER FLOODPLAINS: THE CHARLES RIVER RESPONSE,
Massachusetts Univ., Amherst. Dept. of Geology and Geography.
R. H. Platt, and G. M. McMullen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 316, Price codes: A06 in paper copy, A01 in microfiche. University of Massachusetts Water Resources, Research Center Publication No. 101, 1979. 112 p, 8 fig, 8 tab, 38 ref, 3 append. OWRT-A-101-MASS (1), 14-34-0001-8023.

Descriptors: *Floodplain insurance, *Flood plain zoning, *Flood protection, Flood control, Massachusetts, Non-structural alternatives, Water law, Water policy, *Water management, Alternative planning, *Charles River.

Public authority to manage floodplains in the United States is fragmented among diverse political bodies: states, special district, counties, and municipalities. Each unit is vested with specific powers affecting the use of land and water resources within its boundaries. Differences in the plans, policies, and actions of individual entities give rise to adverse externalities affecting upstream, downstream, and cross-stream interests. Flooding may be increased in stage, frequency, and rapidity due to constriction of the channel or floodplain. This reduces the effectiveness of floodplain management efforts, both structural and nonstructural in neighboring areas. Issues arising from incompatible floodplain practices concern: (1) management versus non-management; (2) structural versus non-structural; (3) levels of protection; (4) compatibility of regulations; (5) natural flood storage areas. Joint undertakings which raise problems of coordination involve: (1) joint regulation; (2) joint acquisition; and (3) extraterritorial authority. The Charles River Watershed in Massachusetts is the scene of a complex experiment in intergovernmental floodplain management. Both structural and non-structural measures are employed. Participants include federal, state, regional, and local entities. Experience to date is examined and unresolved issues are set forth. (Godfrey-Mass)

6G. Ecologic Impact Of Water Development

SUBSIDENCE AND RELATED EFFECTS ON WASTEWATER COLLECTION AND TREATMENT FACILITIES.
Gulf Coast Waste Disposal Authority, Houston, TX.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 579, Price codes: A04 in paper copy, A01 in microfiche. Final Report 1976. 62 p, 1 fig, 2 tab, 29 ref.

Descriptors: *Land subsidence, Groundwater, *Water table, *Water quality, Texas, *Inflow, Water treatment, Performance, *Tides, Floods, Sewerage, Gulf coastal plain, Coliforms.

Land subsidence in the Houston area and its effects on domestic facilities and collection systems were investigated. A literature search indicated that inflow due to tidal flooding of previously dry areas was the only verifiable impact of land subsidence due to groundwater withdrawal. The mapping of Houston area subsidence-affected land areas and domestic water treatment plants involved identifying and mapping tidal flood-prone areas. Communities whose service areas or sewage plants had become partially inundated by regular flood tides were identified. The effects of subsided treatment plants on water quality involved increases in organic and nutrient loads and coliform bacteria contamination resulting from reduced waste water treatment facility efficiency. Twenty reports and articles dealing with land subsidence in general or land subsidence in the Houston area are summarized. (Small-FIRL)

WATER PLANNING AND THE ENVIRONMENT: 1776-1976,
Stanford Univ., CA. Dept. of Civil Engineering.
L. Ortolano.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 105, No WR1, p 65-78, March 1979. 37 ref.

Descriptors: *Water resources, *Planning, *Environment, *Natural resources, *History, *Interagency cooperation, Federal government, Conservation, Government agencies, Social needs, Effects, Ecology, Economic decision criteria, Impact assessment.

The history of the ways in which environmental factors have been integrated into water resources planning is divided into three periods. During the first period, the years from 1776 to 1900, there was relatively little concern over the environmental impacts of water projects. The second period, from 1900 to 1970, represents a term during which environmental issues were concerned largely with the elimination of recklessness and waste and the efficient utilization of water resources. Environmental factors sometimes received consideration as a result of the concerns of citizens' groups and as a result of interagency coordination requirements. The third period, the years since 1970, represents a time during which water resources agencies have been routinely faced with a host of environmental concerns. Some of these relate to principal problems of the previous period, i.e., the efficient use of resources. Others however, e.g., the preservation of scarce natural environments and the maintenance of ecological stability and diversity, are relatively new issues. (Bell Graf-Cornell)

PACIFIC NORTHWEST RIVER BASINS COMMISSION: ANNUAL REPORT, FISCAL YEAR 1976,
Pacific Northwest River Basin Commission, Vancouver, WA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 947, Price codes: A02 in paper copy, A01 in microfiche. 1976. 20 p, 9 fig.

Descriptors: *Water resources, *Water resources development, *Regional development, *Pacific Northwest U.S., *Columbia River basin, Kootenai River Basin(Montana), Snohomish River Basin(Washington), *Land use, Comprehensive planning, Future planning(Projected), Environmental effects, Natural resources, Social aspects, Water policy.

The activities and programs of the Pacific Northwest River Basins Commission are summarized for the period July 1, 1975 through June 30, 1976. The Commission is preparing a water and related resources program intended to serve as a guide to decision makers. When completed, it will establish goals and objectives; identify issues, problems, and needs of the region; and offer programs for the best uses and institutional arrangements for managing the region's water and related resources. The Columbia River Estuary Special Proposal was forwarded to the Water Resources Council for funding along with the Snohomish River Basin Proposal to Study and a Proposal to Study for a Level B investigation of the Kootenai River Basin in Montana and Idaho. The 'Stewards of the River' program continued its objective to enhance the cultural, historical, educational, and esthetic aspects of the Columbia River and its major tributaries. Activities of the standing committees are reviewed, and a financial statement is included. (Davison-IPA)

UPPER MISSISSIPPI RIVER BASIN COMMISSION,
Upper Mississippi River Basin Commission, Twin Cities, MN.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 950, Price codes: A02 in paper copy, A01 in microfiche. Fifth Annual Report, 1976. 22 p, 14 fig.

Descriptors: *Water resources, *Water resources development, *Upper Mississippi River Basin, *Land use, *Comprehensive planning, Future planning(Projected), Environmental effects, Natural resources, Social aspects, Regional development, Water policy, Red River Basin(Minnesota).

The activities and programs of the Upper Mississippi River Basin Commission are summarized for the period July 1, 1975 through September 30, 1976. The U.S. Water Resources Council approved of the Commission's Proposal for the Study of the Upper Mississippi River Main Stem Level B program which was scheduled to begin during fiscal 1977. The ongoing coordinated management program is discussed. The Level B Study of the Water and Related Land Resources of the Minneapolis/St. Paul Metropolitan Area was completed in June 1976. A Comprehensive, Coordinated Joint Plan (CCJP) was adopted by the Commission for the Souris-Red-Rainy and Upper Mississippi Regions. The Commission has requested the U.S. Water Resources Council to provide $720,000 for a 2-year water related land resources study in the Red River Basin. The Commission's participation in the National Assessment of the Nation's water and related land resources is discussed, the Commission's CCJP is examined, and statewide planning assistance is reviewed. A financial statement is provided. (Davison-IPA)
W79-06772

MISSOURI RIVER BASIN COMMISSION ANNUAL REPORT, FISCAL 1976 AND TRANSITIONAL QUARTER,
Missouri River Basin Commission, Omaha, NE.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 948, Price codes: A02 in paper copy, A01 in microfiche. 1976. 18 p, 12 fig.

Descriptors: *Water resources, *Water resources development, *Missouri River Basin, Comprehensive planning, Future planning(Projected), Environmental effects, Natural resources, Water policy, Land use, Regional development, Platte River Basin(Nebraska).

The activities and programs of the Missouri River Basin Commission are summarized for the period July 1, 1975 through September 30, 1976. The continuous planning effort of the Commission is embodied in the comprehensive, coordinated joint plan (CCJP) which currently consists of two elements: the conclusions and recommendations of the 1971 Framework Study Report, and the comprehensive plan developed by the 1976 Platte River Basin, Nebraska, Level B Study. The Platte River Basin of Nebraska is the first area to be included in a CCJP plan. A similar planning effort, the Yellowstone Basin and Adjacent Coal Field Area Level B Study, is underway. The Commission prepared and published two technical memoranda as part of the National Assessment program: a compilation of problems relating to the Basin's water and related land resources, and refinement of these problems along with water-oriented data for the Basin. The setting of priorities is discussed. The 'Federal and State Program Review' contains a comprehensive review of the water and related land resources studies, research, data collection, and implementation of projects and programs within the Basin. Committee activities are reported; a financial statement is included. (Davison-IPA)

[illegible] BASIN COMMISSION. 1976 ANNUAL REPORT,
Great Lakes Basin Commission, Ann Arbor, MI.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 042, Price codes: A03 in paper copy, A01 in microfiche. [illegible] fig.

Descriptors: *Water resources, *Water resources development, *Great Lakes Basin, Planning, Comprehensive planning, Future planning(Projected), Environmental effects, Natural resources, Water policy, Water quality, Erosion, Land use, Sedimentation, Flood control, Recreation, Fish, Wildlife, Management, Social aspects, Regional development.

Highlights of the activities, programs, studies and a financial statement for the period July 1, 1975 through September 30, 1976, are reported. Among the members of the Great Lakes Basin Commission are the States of Illinois, Indiana, Michigan, Minnesota, New York, Ohio, Pennsylvania, and Wisconsin. During the period the Commission continued to advocate increased State responsibility and involvement in all planning activities. Work began on the comprehensive coordinated joint plan for the Great Lakes. This is a broad effort to guide the use of water related resources as far as 50 years into the future. The Great Lakes Basin Framework Study, a comprehensive basic study on the Great Lakes System, was completed. The National Water Assessment--Great Lakes Region is scheduled for completion in 1978. 'Great Lakes Basin Programs 1976-1977' describes planning, research, and data acquisition programs conducted by government agencies during 1976. Progress is reported on Level B studies and policy studies. Activities of the various standing committees and States are reviewed. The Great Lakes Basin Library, open to the public, is a Selected Federal Depository Library and receives all Federal publications pertaining to water and land in the Great Lakes Basin. (Davison-IPA)
W79-06784

SHORELINES MANAGEMENT '77: PERFORMANCE AND PROSPECTS.
Washington Univ., Seattle. Div. of Marine Resources.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 928, Price codes: A08 in paper copy, A01 in microfiche. Report No WSG-W077-3, Washington Sea Grant Communications Program, Proceedings of a Conference held September 22-23, 1977, Seattle, Washington, 171 p, 2 fig, 1 tab, 18 ref, Goodwin, R. F., Editor.

Descriptors: *Planning, *Management, *Coasts, *Washington, Community development, Environment, Environmental effects, Cities, Estuaries, Shores, Conservation, Land management, Water resources development, Harbors, Recreation, Marinas, Legal aspects, Legislation, Zoning, Beaches, Lakes, Streams.

Twenty papers by authorities from government, academia, and other institutions are provided that deal with coastal management. The broad areas of coverage are: shoreline environmental management and community development, policies and guidelines for managing aquatic areas, legal and legislative issues, and shorelines management administration. (Davison-IPA)

NEW ENGLAND RIVER BASINS COMMISSION.
New England River Basins Commission, Boston, MA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 949, Price codes: A02 in paper copy, A01 in microfiche. Annual Report, 1976. 20 p, 11 fig, 4 append.

Descriptors: *New England River Basins Commission, *Planning, *Management, *Water resources, *Land managements, *Environmental control, Water resources development, Regional development, River basin development, River basins, Continental shelf, Flood plains, Connecticut River.

During 1976 New England's attitude was for environmental management and protection. Although [illegible] ment with strong environmental controls, economic growth was also a goal. The New England River Basins Commission (NERBC) is responsible for preparing and keeping up-to-date a Comprehensive, Coordinated Joint Plan which recommends ways in which Federal, State and local governments and other institutions can manage water and related land resources wisely. The NERBC conducts individual studies dealing with complex severe regional problems and prepares basin 'planning guides.' The progress of the following studies is summarized: the Connecticut River Basin, Southern New England Basins, New Hampshire Basins, Lake Champlain Basins, and Maine Basins. Onshore oil and gas facilities are discussed. The activities of the Coastal Zone Task Force and the Outer Continental Shelf Task Force are reviewed. Preliminary conclusions regarding the NERBC's 1975 Assessment of Water and Land Resources are presented. The Task Force on Flood Plain Management focused on the three national programs: The National Flood Insurance Program, the Water Resources Council's unified national program for flood plain management, and new Federal regulations for wetland dredge and fill activity. A publications list and financial summary are included in the appendices. (Davison-IPA)
